

The `microtype` package

An interface to the micro-typographic extensions of pdf \TeX

R Schlicht

w.m.l@gmx.net

v2.3d

2009/03/27

Abstract

The `microtype` package provides a \LaTeX interface to the micro-typographic extensions of pdf \TeX : most prominently, character protrusion and font expansion, furthermore the adjustment of interword spacing and additional kerning, as well as hyphenatable letterspacing (tracking) and the possibility to disable all or selected ligatures. It allows to apply these features to customisable sets of fonts, and to configure all micro-typographic aspects of the fonts in a straight-forward and flexible way. Settings for various fonts are provided.¹

Note that font expansion and character protrusion will only work with pdf \TeX , at least version 0.14f. Automatic font expansion requires version 1.20 or newer. Disabling ligatures requires pdf \TeX 1.30, letterspacing and the adjustment of interword spacing and of kerning requires version 1.40. The package will by default enable protrusion and expansion if they can safely be assumed to work. These two features are also available with luat \TeX . The `microtype` package does not work with X \TeX .

The alternative package `letterspace`, which also works with plain \TeX , provides the user commands for letterspacing only, omitting support for all other extensions (see section 7).

This package is copyright © 2004–2009 R Schlicht. It may be distributed and/or modified under the conditions of the [\TeX Project Public License](#), either version 1.3c of this license or (at your option) any later version. This work has the LPPL maintenance status ‘author-maintained’.

¹ Currently, this package provides protrusion settings for Computer Modern Roman, Palatino, Times, URW Garamond, Adobe Garamond and Minion, Bitstream Charter and Letter Gothic, the AMS symbols and Euler fonts, for various Euro symbol fonts, as well as some generic settings for unknown fonts (cf. table 3 on page 21). Contributions are very welcome.

1 Micro-typography with pdfTeX

pdfTeX, the TeX extension written by Hàn Thé Thành, introduces a number of micro-typographic features that make it the tool of choice not only for the creation of electronic documents but also of works of outstanding time-honoured typography: most prominently, *character protrusion* (also known as margin kerning) and *font expansion*. Quoting Hàn Thé Thành's thesis:

After you have read the text on the right, you can view the effect of the features it describes by clicking on the links:

Protrusion off
Expansion off

Both features are enabled throughout this document.

'Margin kerning is the adjustments of the characters at the margins of a typeset text. A simplified employment of margin kerning is hanging punctuation. Margin kerning is needed for optical alignment of the margins of a typeset text, because mechanical justification of the margins makes them look rather ragged. Some characters can make a line appear shorter to the human eye than others. Shifting such characters by an appropriate amount into the margins would greatly improve the appearance of a typeset text.'

Composing with font expansion is the method to use a wider or narrower variant of a font to make interword spacing more even. A font in a loose line can be substituted by a wider variant so the interword spaces are stretched by a smaller amount. Similarly, a font in a tight line can be replaced by a narrower variant to reduce the amount that the interword spaces are shrunk by. There is certainly a potential danger of font distortion when using such manipulations, thus they must be used with extreme care. The potentiality to adjust a line width by font expansion can be taken into consideration while a paragraph is being broken into lines, in order to choose better breakpoints.' [Thành 2000, p. 323]

Both these features have been lacking a simple L^AT_EX user interface for quite some time. Then, the `pdfcprot` package was released, which allowed L^AT_EX users to employ character protrusion without having to mess much with the internals.

Font expansion, however, was still most difficult to utilise, since it required that the font metrics are available for all levels of expansion. Therefore, anybody who wanted to make use of this feature had to create multiple instances of the fonts in advance. Shell scripts to partly relieve the user from this burden were available – however, it remained a cumbersome task. Furthermore, all fonts were still being physically created, thus wasting compilation time and disk space.

In the summer of 2004, Hàn Thé Thành implemented a feature that has proven as a major facilitation for TeX and L^AT_EX users: font expansion can now take place automatically. That is, pdfTeX no longer needs the expanded font metrics but will calculate them at run-time and completely in memory.

After this great leap in usability had been taken, the development did not stop. On the contrary, pdfTeX was extended with even more features: version 1.30 introduced the possibility to *disable all ligatures*, version 1.40 a robust *letterspacing* command, the *adjustment of interword spacing* and the possibility to specify *additional character kerning*.

Robust and hyphenatable *letterspacing (tracking)* has always been extremely difficult to achieve in TeX. Although the `soul` package undertook great efforts in making this possible, it could still fail in certain circumstances; even to adjust the tracking of a font throughout the document remained impossible. Employing pdfTeX's new extension, this no longer poses a problem. The `microtype` package

provides the possibility to change the tracking of customisable sets of fonts, e.g., all small capitals. It also introduces two new commands `\textls` and `\lsstyle` for ad-hoc letterspacing, which can be used like the normal text commands. Note that letterspacing only works in PDF mode.

Adjustment of interword spacing is based upon the idea that in order to achieve a uniform greyness of the text, the space between words should also depend on the surrounding characters. For example, if a word ends with an ‘r’, the following space should be a tiny bit smaller than that following, say, an ‘m’. You can think of this concept as an extension to TEX’s ‘space factors’. However, while space factors will influence all three parameters of interword space (or glue) by the same amount – the kerning, the maximum amount that the space may be stretched and the maximum amount that it may be shrunk – pdfTEX provides the possibility to modify these parameters independently from one another. Furthermore, the values may be set differently for each font. And, probably most importantly, the parameters may not only be increased but also decreased. This feature may enhance the appearance of paragraphs even more. Emphasis in the last sentence is on the word ‘may’: this extension is still highly experimental – in particular, only ending characters will currently have an influence on the interword space. Also, the settings that are shipped with microtype are but a first approximation, and I would welcome corrections and improvements very much. I suggest reading the reasoning behind the settings in section 15.9.

Setting *additional kerning* for characters of a font is especially useful for languages whose typographical tradition requires certain characters to be separated by a space. For example, it is customary in French typography to add a small space before question mark, exclamation mark and semi-colon, and a bigger space before the colon and the guillemets. Until now, this could only be achieved by making these characters active (for example by the `babel` package), which may not always be a robust solution. In contrast to the standard kerning that is built into the fonts (which will of course apply as usual), this additional kerning is based on single characters, not on character pairs.

The possibility, finally, to *disable all ligatures* of a font may be useful for type-writer fonts.

The microtype package provides an interface to all these micro-typographic extensions. All micro-typographic aspects may be customised to your taste and needs in a straight-forward manner. The next chapters will present a survey of all options and customisation possibilities.

2 Getting started

There is nothing surprising in loading this package:

```
\usepackage{microtype}
```

This will be sufficient in most cases, and if you are not interested in fine-tuning the micro-typographic appearance of your document (which would seem unlikely, since using this package is proof of your interest in typographic issues), you may

actually skip the rest of this document. If this, on the other hand, does not satisfy you – be it for theoretical or practical reasons – this manual will guide you on the path to the desired results along the following milestones:

- Enable the respective micro-typographic feature, either via the respective package option or with the `\microtypesetup` command (section 3).
- Select the fonts to which this feature should be applied by declaring and activating ‘sets of fonts’. Some sets are predefined, which may be activated directly in the package options (section 4).
- Fine-tune the micro-typographic settings of the fonts or sets of fonts (section 5).
- If you’re of the kind who always wants to march on, you’ll certainly be interested in the possibility of context-sensitive setup (section 6).
- You are even countenanced to leave the path of typographic virtue and steal some sheep (section 7) or trespass in other ways (section 8).
- Should you encounter any obstacles, follow the hints and caveats (section 9).

3 Options

Like many other L^AT_EX packages, the `microtype` package accepts options in the well known key=value syntax. In the following, you’ll find a description of all **keys** and their possible values (‘true’ may be omitted; multiple values, where allowed, must be enclosed in braces; the default value is shown on the right, preceded by an asterisk if it is contingent on the pdfT_EX version and/or the output mode).

3.1 Enabling the micro-typographic features

protrusion true, false, compatibility, nocompatibility, *(font set name)* * true

expansion These are the main options to control the level of micro-typographic refinement which the fonts in your document should gain. By default, the package is moderately greedy: character protrusion will be enabled, font expansion will only be disabled in circumstances where pdfT_EX cannot expand the fonts automatically, that is, if it is either too old (versions before 1.20) or if the output mode is DVI (see section 3.5). In other words, `microtype` will try to apply as much micro-typography as can safely be expected to work under the respective conditions (and it is usually not necessary to load the package with different options for PDF resp. DVI mode).

activate Protrusion and expansion may be enabled or disabled independently from each other by setting the respective key to true resp. false. The activate option is a shortcut for setting both options at the same time. Therefore, the following lines all have the same effect (when creating PDF files with a recent version of pdfT_EX):

```
\usepackage[protrusion=true,expansion]{microtype}
```

```
\usepackage[activate={true,nocompatibility}]{microtype}
```

```
\usepackage{microtype}
```

Table 1: Availability of micro-typographic features

TeX engine			Micro-typographic features						
Engine	Version	Output	Protrusion	Expansion	(= auto)	Kerning	Spacing	Tracking	
pdfTeX	< 0.14f	DVI/PDF	∅	∅	∅	∅	∅	∅	
	≥ 0.14f	DVI/PDF	★	☒	∅	∅	∅	∅	
	≥ 1.20	DVI	★	☒	∅	∅	∅	∅	
		PDF	★	★	★	∅	∅	∅	
	≥ 1.40	DVI	★	☒	∅	☒	☒	☒	
		PDF	★	★	★	☒	☒	☒ ^a	
luatex	≥ 0.25	DVI	★	☒	∅	∅	∅	∅	
		PDF	★	★	★	∅	∅	∅	

★ = enabled ☒ = not enabled ∅ = not available a ≥ 1.40.4 recommended

When pdfTeX employs font expansion and character protrusion, line breaks (and consequently, page breaks) may turn out differently. If this is not desired – because you are re-typesetting a book whose pagination must not change – you may pass the value `compatibility` to the `protrusion` and/or `expansion` options. Typographically, however, the results will be suboptimal, hence the default value is `nocompatibility`.

Finally, you may also specify the name of a font set to which character protrusion and/or font expansion should be restricted. See section 4 for a detailed discussion. Specifying a font set for a feature implicitly activates this feature.

<code>tracking</code>	<code>true, false, </code>	<code>false</code>
<code>spacing</code>	There is no compatibility level for the new extensions of tracking, interword spacing, and additional kerning. Therefore, they can only be switched on or off, or they may be activated by passing a set name to the option. By default, neither feature is enabled.	
<code>kerning</code>		

In table 1, you find an overview of which micro-typographic features are available and enabled by default for the relevant pdfTeX versions and output modes.

Whether ligatures should be disabled cannot be controlled via a package option but by using the `\DisableLigatures` command, which is explained in section 8.

3.2 Character protrusion

<code>factor</code>	<code><integer></code>	1000
---------------------	------------------------------	------

Using this option, you can globally increase or decrease the amount by which the characters will be protruded. While a value of 1000 means that the full protrusion as specified in the configuration (see section 5.1) will be used, a value of 500 would result in halving all protrusion factors of the configuration. This might be useful if you are generally satisfied with the settings but prefer the margin kerning to be less or more visible (e.g., if you are so proud of being able to use this feature that you want everybody to see it, or – to mention a motivation more in compliance

with typographical correctness – if you are using a large font that calls for more modest protrusion).

unit character, *(dimension)* character

This option is described in section 5.1, apropos the command `\SetProtrusion`. Use with care.

3.3 Font expansion

auto true, false * true

As noted in chapter 1, the expanded versions of the fonts may be calculated automatically. This option is true by default provided that pdfTeX’s version is found to be 1.20 or higher and the output mode is PDF; otherwise, it will be disabled. If auto is set to false, the fonts for all expansion steps must exist (with files called *font name* \pm *(expansion value)*, e. g., `cmb12+10`, as described in the [pdfTeX manual](#)).

Automatic font expansion does not work with bitmap fonts. Therefore, if you are using the Computer Modern Roman fonts in T1 encoding², you should either install the cm-super fonts or use the Latin Modern fonts (package `lmodern`).

stretch *(integer)* 20

shrink You may specify the stretchability and shrinkability of a font, i. e., the maximum amount that a font may be stretched or shrunk. The numbers will be divided by 1000, so that a stretch limit of 10 means that the font may be expanded by up to 1%. The default stretch limit is 20. The shrink limit will by default be the same as the stretch limit.

step *(integer)* * 1

Fonts are not expanded by arbitrary amounts but only by certain discrete steps within the expansion limits. With recent versions of pdfTeX (1.40 or newer), this option is by default set to 1, in order to allow pdfTeX to try the maximum number of font instances, and hence to guarantee the best possible output. One problem that may occur here is that pdfTeX runs out of memory with huge documents; in this case, read about the error messages in the hints and caveats section (9), or try with a larger step. Older pdfTeX versions, however, had to include every font instance in the PDF file, which may increase the file size quite dramatically. Therefore, in case you are using a pre-1.40 pdfTeX version, step is by default set to one fifth of the smaller value of stretch and shrink.

selected true, false false

When applying font expansion, it is possible to restrict the expansion of some characters that are more sensitive to deformation than others (e. g., the ‘O’, in contrast to the ‘T’). This is called *selected expansion*, and its usage allows to increase the stretch and shrink limits (to, say, 30 instead of 20); however, the gain is limited since at the same time the average stretch variance will be decreased. Therefore, this option is by default set to false, so that all characters will be expanded by the same amount. See section 5.2 for a more detailed discussion.

² En passant, it may be noted that Type 1 format and T1 encoding are in no other way related than that both start with a ‘T’ and end with a ‘1’.

3.4 Tracking/letterspacing

letterspace	$\langle\text{integer}\rangle$	100
This option changes the default amount for tracking (see section 5.3) resp. letter-spacing (see section 7). The amount is specified in thousandths of 1 em; admissible values are in the range of -1000 to $+1000$.		

3.5 Miscellaneous options

DVIoutput	true, false	* false
$\text{pdf}\TeX$ is not only able to generate PDF output but can also spit out DVI files. ³ The latter can be ordered with the option DVIoutput , which will set \pdfoutput to zero.		

Note that this will confuse packages that depend on the value of \pdfoutput if they were loaded earlier, as they had been made believe that they were called to generate PDF output where they actually weren't. These packages are, among others: `graphics`, `color`, `hyperref`, `pstricks` and, obviously, `ifpdf`. Either load these packages after `microtype` or else issue the command $\text{\pdfoutput}=0$ earlier – in the latter case, the **DVIoutput** option is redundant.

When generating DVI files, font expansion has to be enabled explicitly. Neither letterspacing nor *automatic* font expansion will work because the postprocessing drivers (`dvips`, `dvipdfm`, etc.) resp. the DVI viewer are not able to generate the fonts on the fly.

draft	true, false	false
If the draft option is passed to the package, <i>all micro-typographic extensions will be disabled</i> , which may lead to different line, and hence page, breaks. The draft and final options may also be inherited from the class options; of course, you can override them in the package options. E. g., if you are using the class option draft to show any overfull boxes, you should load <code>microtype</code> with the final option.		

verbose	true, false, errors, silent	false
Information on the settings used for each font will be written into the log file if you enable the verbose option. When <code>microtype</code> encounters a problem that is not fatal (e. g., an unknown character in the settings, or non-existent settings), it will by default only issue a warning and try to continue. Loading the package with verbose=errors will turn all warnings into errors, so that you can be sure that no problem will go unnoticed. If on the other hand you have investigated all warnings and decide to ignore them, you may silence <code>microtype</code> with verbose=silent .		

babel	true, false	false
Loading the package with the babel option will adjust the typesetting according to the respective selected language. Read section 6 for further information.		

config	$\langle\text{file name}\rangle$	<code>microtype</code>
Various settings for this package will be loaded from a main configuration file, by default <code>microtype.cfg</code> (see section 5.7). You can have a different configuration file loaded instead by specifying its name <i>without the extension</i> , e. g., <code>config=myctypr</code> .		

³ Recent \TeX systems are using $\text{pdfe}\TeX$ as the default engine even for DVI output.

3.6 Changing options later

`\microtypesetup {⟨key = value list⟩}`

Inside the preamble, this command accepts all package options described above (except for config). In the document body, this command may be used to change the general settings of the micro-typographic extensions. It then accepts all options from section 3.1: `expansion`, `protrusion` and `activate`, which in turn may receive the values `true`, `false`, `compatibility` or `nocompatibility`, and `tracking`, `spacing` and `kerning` with the admissible values `true` or `false`. Passing the name of a font set is not allowed. Using this command, you could for instance temporarily disable font expansion by saying:

```
\microtypesetup{expansion=false}
```

4 Selecting fonts for micro-typography

By default, character protrusion will be applied to all text fonts that are being used in the document, and a basic set of fonts will be subject to font expansion. You may want to customise which fonts should get the benefit of micro-typographic treatment. This can be achieved by declaring and activating ‘font sets’; these font sets are specified via font attributes that have to match.

`\DeclareMicrotypeSet [⟨features⟩] {⟨set name⟩} {⟨set of fonts⟩}`

`\DeclareMicrotypeSet*` This command declares a new set of fonts to which the micro-typographic extensions should be applied. The optional argument may contain a comma-separated list of features to which this set should be restricted. The starred version of the command declares *and activates* the font set at the same time.

The `set of fonts` is specified by assigning values to the NFSS font attributes: encoding, family, series, shape and size (cf. [L^AT_EX 2_E font selection](#)). Let’s start with an example. This package defines a font set called ‘basictext’ in the main configuration file as follows:

```
\DeclareMicrotypeSet{basictext}
{ encoding = {OT1,T1,LY1,OT4,QX,T5},
  family   = {rm*,sf*},
  series   = {md*},
  size     = {normalsize,footnotesize,small,large}
}
```

If you now call

```
\UseMicrotypeSet[protrusion]{basictext}
```

in the document’s preamble, only fonts in the text encodings OT1, T1, LY1, OT4, QX or T5, roman or sans serif families, normal (or ‘medium’) series, and in sizes called by `\normalsize`, `\footnotesize`, `\small` or `\large`, will be protruded. Math fonts, on the other hand, will not, since they are in another encoding. Neither will fonts in bold face, or huge fonts. Etc.

If an attribute list is empty or missing – like the ‘shape’ attribute in the above example – it does not constitute a restriction. In other words, this is equivalent to specifying *all* possible values for that attribute. Therefore, the predefined set ‘alltext’, which is declared as:

```
\DeclareMicrotypeSet{alltext}
{ encoding = {OT1,T1,LY1,OT4,QX,T5,TS1} }
```

is far less restrictive. The only condition here is that the encoding must match.

If a value is followed by an asterisk (like ‘rm*’ and ‘sf*’ in the first example), it does not designate an NFSS code, but will be translated into the document’s `\(value)default`, e.g., `\rmdefault`.⁴ A single asterisk means `\(attribute)default`, e.g., `\encodingdefault`, respectively `\normalsize` for the size axis. Sizes may either be specified as a dimension (‘10’ or ‘10pt’), or as a size selection command *without* the backslash. You may also specify ranges (e.g., ‘small-Large’); while the lower boundary is included in the range, the upper boundary is not. Thus, ‘12-16’ would match 12 pt, 13.5 pt and 15.999 pt, for example, but not 16 pt. You are allowed to omit the lower or upper bound (‘-10’, ‘large-’).

Additionally to this declaration scheme, you can add single fonts to a set using the ‘font’ key, which expects the concatenation of all font attributes, separated by forward slashes, i.e., ‘font = *encoding*/*family*/*series*/*shape*/*size*’. This allows you to add fonts to the set that are otherwise disjunct from it. For instance, if you wanted to have the roman family in all sizes protruded, but only the normal sized, possibly italic, typewriter font (in contrast to, say, the small one), this is how you could declare the set:

```
\DeclareMicrotypeSet[protrusion]
{ myset }
{ encoding = T1,
  family   = rm*,
  font      = {T1/tt*/m/n/*,
               T1/tt*/m/it/*} }
```

As you can tell from the example, the asterisk notation is also allowed for the font key. A single asterisk is equivalent to ‘*//*/*/*/*’, i.e., the normal font. Size selection commands are possible, too, however, ranges are not allowed.

Table 2 lists the nine predefined font sets. They may also be activated by passing their name to the feature options `protrusion`, `expansion`, `tracking`, `spacing` and `kerning` when loading the package, for example:

```
\usepackage[protrusion=allmath,tracking=smallcaps]{microtype}
```

`\UseMicrotypeSet [⟨features⟩] {⟨set name⟩}`

This command activates a font set previously declared by `\DeclareMicrotypeSet`. Using the optional argument, you can limit the application of the set to one or more features. This command only has an effect if the feature was activated in the package options.

⁴ These translations will take place `\AtBeginDocument`, which means that changes to the defaults inside the preamble will also be taken into account. Only in cases where you change font defaults `\AtBeginDocument` yourself, you need to load `microtype` after these changes.

Table 2: Predefined font sets

Set name	Font attributes				
	Encoding	Family	Series	Shape	Size
all	∅	∅	∅	∅	∅
alltext (allmath)	Text encodings, TS1 (OML, OMS, U)	∅	∅	∅	∅
basictext (basicmath)	Text encodings (OML, OMS)	\rm*, \sf*	\md*	∅	\normalsize, \footnotesize, \small, \large
smallcaps	Text encodings	∅	∅	sc	∅
footnotesize	Text encodings, TS1	∅	∅	∅	-\small
scriptsize	Text encodings, TS1	∅	∅	∅	-\footnotesize
normalfont	\encoding*	\family*	\series*	\shape*	\normalsize

'Text encodings' = OT1, T1, LY1, OT4, QX, T5 '...*' = '...default'

```
\DeclareMicrotypeSetDefault [⟨features⟩] {⟨set name⟩}
```

If a feature is enabled but no font set has been chosen explicitly, the sets declared by this command will be activated. By default, the ‘alltext’ font set will be used for character protrusion and additional kerning, the ‘basictext’ set for font expansion and interword spacing, and the ‘smallcaps’ set for tracking.

These commands may only be used in the preamble or in the main configuration file. Their scope is global to the document. Only one set per feature may be activated.

5 Micro fine tuning

Every character asks for a particular protrusion, spacing or kerning amount. It may also be desirable to restrict the maximum expansion of certain characters. Furthermore, since every font looks different, settings have to be specific to a font or set of fonts. This package offers flexible and straight-forward methods of customising these finer aspects of micro-typography.

All fine-tuning commands follow basically the same syntax: they all take three arguments; the first one is optional and may contain additional options; in the second argument, you specify the set of fonts to which the settings should apply; the third argument contains the actual settings.

The set of fonts to which the settings should apply is declared using the same syntax of ⟨font axis⟩ = ⟨value list⟩ pairs as for the command `\DeclareMicrotypeSet` (see section 4). The only difference is that asterisked values will be translated immediately instead of at the end of the preamble. To find the matching settings for a given font the package will try all combinations of font encoding, family, series, shape and size, with decreasing significance in this order. For instance, if both settings for the current family (say, T1/cmr//) and settings for italic fonts in the normal weight (T1//m/it/) exist, those for the cmr family would apply.⁵ The encoding must always match.

⁵ For the interested, table 4 on page 81 presents the exact order.

5.1 Character protrusion

\SetProtrusion [⟨options⟩] {⟨set of fonts⟩} {⟨protrusion settings⟩}

Using this command, you can set the protrusion factors for each character of a font or a set of fonts. A very incomplete example would be the following:

```
\SetProtrusion
{ encoding = T1,
  family   = cmr }
{ A         = {50,50},
  \textquotel = {700, } }
```

which would result in the character ‘A’ being protruded by 5% of its width on both sides, and the left quote character by 70% of its width into the left margin. This would apply to all font shapes, series and sizes of the T1 encoded Computer Modern Roman family.

The protrusion settings consist of ⟨character⟩ = ⟨protrusion factors⟩ pairs.

The characters may be specified either as a single character (‘A’), as a text symbol command (‘\textquotel’), or as a slot number: three digits for decimal notation, prefixed with “ for hexadecimal, with ‘ for octal (e.g., the ‘fl’ ligature in T1 encoding: 029, “1D, ‘35). 8-bit (and even UTF-8) characters may be entered directly or in L^AT_EX’s traditional 7-bit notation: both “A and Ä are valid, provided the character is actually declared in both the input and the font encoding. Note that you also have the possibility to declare lists of characters that should inherit settings (see section 5.6).

The protrusion factors designate the amount that a character should be protruded into the left margin (first value) respectively into the right margin (second value). By default, the values are relative to the character widths, so that a value of 1000 means that the character should be shifted fully into the margin, while, for example, with a value of 50 it would be protruded by 5% of its width. Negative values are admitted, as well as numbers larger than 1000 (but effectively not more than 1 em of the font). You can omit either number if the character should not be protruded on that side, but must not drop the separating comma.

Options:

name You may assign a name to the protrusion settings, so that you are able to load it by another list.

load You can load another list (provided, you previously assigned a name to it) before the current list will be loaded, so that the fonts will inherit the values from the loaded list.

Thus, the configuration may be simplified considerably. You can for instance create a default list for a font; settings for other shapes or series can then load these settings, and extend or overwrite them (since the value that comes last will take precedence). Font settings will be loaded recursively. The following options will affect all loaded lists:

factor This option can be used to influence all protrusion factors of the list, overriding any global factor setting (see section 3.2). For instance, if you want

fonts in larger sizes to be protruded less, you could load the normal lists, just with a different factor applied to them:

```
\SetProtrusion
[ factor = 700
  load   = cmr-T1 ]
{ encoding = T1,
  family  = cmr,
  size    = large- }
{ }
```

unit By default, the protrusion factors are relative to the respective character's width. The `unit` option may be used to override this and make `microtype` regard all values in the list as thousandths of the specified width. Issuing, for instance, '`unit=1em`' would have the effect that a value of, say, 50 now results in the character being protruded by 5% of an em of the font (thus simulating the internal measuring of pdfTeX's `\lpcode` and `\rpcode` primitives). The default behaviour can be restored with `unit=character`.⁶

preset Presets the protrusion codes of all characters to the specified values ($\{\langle left \rangle, \langle right \rangle\}$), possibly scaled by a factor. A `unit` setting will only be taken into account if it is not `=character`.

inputenc Selects an input encoding that should apply to this list, regardless of what the document's input encoding is. You may specify any encoding that can be loaded via the `inputenc` package, e. g., `ansinew`, `koi8-r`, `utf8`.

context The scope of the list may be limited to a certain context. For an example application, see section 6.

5.2 Font expansion

`\SetExpansion` [$\langle options \rangle$] { $\langle set of fonts \rangle$ } { $\langle expansion settings \rangle$ }

By default, all characters of a font are allowed to be stretched or shrunk by the same amount. However, it is also possible to limit the expansion of certain characters if they are more sensitive to deformation. This is the purpose of the `\SetExpansion` command. Note that it will only have an effect if the package was loaded with the `selected` option (cf. section 3.3). Otherwise, the expansion settings will be ignored – unlike the options in the optional first argument, which will still be evaluated.

If the package was loaded with the `selected` option, and settings for a font don't exist, font expansion will not be applied to this font at all. Should the extraordinary situation arise that you want to employ selected expansion in general but that all characters of a particular font (set) should be expanded or shrunk by the same amount, you would have to declare an empty list for these fonts.

The expansion settings consist of $\langle character \rangle = \langle expansion factor \rangle$ pairs. You may specify one number for each character, which determines the amount that a character may be expanded. The numbers denote thousandths of the full expansion.

⁶ The `unit` option can even be passed globally to the package (cf. section 3.2). However, all provided settings are created under the assumption that the values are relative to the character width. Therefore, you should only change it if you are certain that the default settings will not be used in your document.

For example, if you set the expansion factor for the character ‘O’ to 500, it will only be expanded or shrunk by one half of the amount that the rest of the characters will be expanded or shrunk. While the default value for character protrusion is 0 – that is, if you didn’t specify any characters, none would be protruded – the default value for expansion is 1000, which means that all characters would be expanded by the same amount.

Options:

name, load, preset, inputenc, context Analogous to `\SetProtrusion`, the optional argument may be used to assign a name to the list, to load another list, to preset all expansion factors, to set the input encoding, or to determine the context of the list (expansion contexts are only possible with pdfTeX version 1.40.4 or newer).

auto, stretch, shrink, step These keys can be used to override the global settings from the package options (see section 3.3). If you don’t specify either one of stretch, shrink and step, their respective global value will be used (that is, no calculation will take place).

As a practical example, suppose you have a paragraph containing a widow that could easily be avoided by shrinking the font a little bit more. In conjunction with the context option (see section 6 for further details), you could thus allow for more expansion in this particular paragraph:

```
\SetExpansion
  [ context = sloppy,
    stretch = 30,
    shrink = 60,
    step   = 5 ]
  { encoding = {OT1,T1,TS1} }
  { }
% ... END PREAMBLE
{\microtypecontext{expansion=sloppy}}
This paragraph contains an `unnecessary' widow.
```

This method of employing contexts to temporarily apply different expansion parameters only works with pdfTeX version 1.40.4 or later (for older versions, a dirty trick is laid out in section 14.2 on page 54). Also note that pdfTeX prohibits the use of fonts with different expansion limits or steps (even of different fonts) within one paragraph, hence the sloppy context has to be applied to complete paragraphs.

factor This option provides a different method to alter expansion settings for certain fonts, working around the restriction just mentioned. The factor option influences the expansion factors of all characters (in contrast to the overall stretchability) of the font. For instance, if you want the italic shape to be expanded less, you could declare:

```
\SetExpansion
  [ factor = 500 ]
  { encoding = *,
    shape    = it }
  { }
```

The `factor` option can only be used to *decrease* the stretchability of the characters, that is, it may only receive values smaller than 1000. Also, it can only be used for single fonts or font sets; setting it globally in the package options wouldn't make much sense – to this end, you use the package's `stretch` and `shrink` options.

5.3 Tracking

`\SetTracking` [`<options>`] {`<set of fonts>`} {`<tracking amount>`}

An important typographic technique – which was missing in TeX for a long time – is the adjustment of tracking, i. e., the uniform addition or subtraction of letter space to/from all the characters in a font. For example, it is good typographic practice to slightly space out text set in all capitals or small capitals (as in this document). Legibility may also be improved by minimally increasing the tracking of smaller and decreasing that of larger type.⁷ The `\SetTracking` command allows to specify the tracking amount for different fonts or font sets. It will also be evaluated by the `\textls` command, which may be used for letterspacing shorter pieces of text (see section 7).

The tracking amount is specified in thousandths of 1 em (or the given unit); negative values are allowed, too.

Options:

name, unit, context These options serve the same functions as in the previous configuration commands. The unit may be any dimension, default is 1 em.

spacing When the inter-letter spacing is altered, the inter-word spacing probably also needs to be adjusted. This option expects three numbers for interword space, stretch and shrink respectively, which are given in thousandths of 1 em (or of the current unit). If a value is followed by an asterisk, it denotes thousandths of the respective font dimension which will be added to it. For instance, with

```
\SetTracking[ spacing = {25*,166, } ]{ encoding = *, shape = sc }{ 25 }
```

the interword space will be increased by 2.5%, the stretch amount will be set to 0.166 em, while the shrink amount will be left untouched. If you don't specify the `spacing` option, the interword space will be scaled by the current letterspace amount (as in the above example), while stretch and shrink will not be changed.

outer spacing If an interword space immediately precedes or follows letter-spaced text, it will by default be equal to that within the text. With this option, which accepts the same values as `spacing`, it may be adjusted independently.

outer kerning If, on the other hand, no interword space precedes or follows, you may still want to slightly set off the first and last letter from adjoining letters. This option expects the kerning amounts for left and right hand side, separated by a comma, in thousandths of 1 em (or the current unit). If a value is followed by an asterisk, it denotes thousandths of the current letterspacing amount. A single asterisk means '500*'; this is also the default, i. e., the sum of the outer kerns is by

⁷ With full-featured fonts like Computer Modern, this is usually not necessary, though, since they come in optical sizes, and the tracking of the small-caps font is already adjusted.

default equal to the current letterspace amount. To remove kerning on both sides, you would write ‘outer kerning={0,0}’.

no ligatures As far as pdfTeX is concerned, ligatures in letterspaced fonts would be constructed as usual, which may be advisable when changing the tracking by only a small amount. For larger letterspacing amounts, on the other hand, the normal letter space within ligatures would have displeasing effects. This key expects a comma-separated list of characters for which ligatures should be disabled; only the character that begins a ligature must be specified. If the key is given without a value, *all* ligatures of the font will be disabled. This is not recommended, however, since it also entails that kerning will be switched off.⁸ The default settings disable ligatures for the character ‘f’ only, i. e., ‘ff’, ‘fi’, ‘ffi’, etc.⁹ In exceptional situations, you can manually break up a ligature by inserting ‘{\kern0pt}’ resp. babel’s ‘|’ shortcut, or protect it by enclosing it in ‘\lslig’ (see section 7).

Since a picture is worth a thousand words, probably even more if, in our case, it depicts a couple of letterspaced words, let’s bring one to sum up these somewhat confusing options. Suppose you had the following settings (which I would in no way recommend; they are only for illustrative purposes):

```
\SetTracking
[ no ligatures = {f},
  spacing      = {600*, -100*, },
  outer spacing = {450, 250, 150},
  outer kerning = {*, *} ]
{ encoding = * }
{ 160 }
```

and then write:

```
Stop \textls{stealing sheep}!
```

this is the (typographically dubious) outcome:

Click on the image to show the kerns and spacings involved.
Click on emphasised words in the text below to reveal the relation of image and code.

While the word ‘Stop’ is not letterspaced, the space between the letters in the other two words is expanded by the *tracking amount* of $160/1000 \text{em} = 0.16 \text{em}$. The *inner space* within the letterspaced text is increased by 60%, while its *stretch* amount is decreased by 10% and the *shrink* amount is left untouched. The *outer space* (of 0.45 em) immediately before the piece of text may *stretch* by 0.25 em and *shrink* by 0.15 em. Note that there is no outer space after the text, since the exclamation mark immediately follows; instead, the default *outer kern* of half the letterspace amount (0.08 em) is added. Furthermore, one *ligature* wasn’t broken up, because we neglected to specify the ‘s’ in the *no ligatures* key.

⁸ The inseparable connexion of ligatures and kerns is a limitation of TeX that will not be lifted before the advent of luaTeX.

⁹ With pdfTeX versions older than 1.40.4, *all* ligatures, and hence all kerning, will be disabled. It is therefore recommended to use at least version 1.40.4.

As another, more realistic example, suppose you want to space out all small capitals by 50/1000 em, fonts smaller than `\small` by 0.02 em, and to decrease the tracking of large type by 0.02 em. You can achieve this with the following settings:

```
\usepackage[tracking=true]{microtype}
\DeclareMicrotypeSet*[tracking]{my}
{ encoding = *,
  size    = {-small,Large-},
  font    = *//*/*sc/* }
\SetTracking[ no ligatures = f ]{ encoding = *, shape = sc}{ 50 }
\SetTracking{ encoding = *, size = -small }{ 20 }
\SetTracking{ encoding = *, size = Large- }{ -20 }
```

Latterspaced fonts for which settings don't exist will be spaced out by the default of 0.1 em (adjustable with the package option `letterspace`, see section 3.5). Suppose your editor wants you to shorten your 1000 pages chef-d'œuvre by a handful of pages, you could load `microtype` with (fingers crossed):

```
\usepackage[tracking=alltext,letterspace=-40]{microtype}
```

5.4 Interword spacing

`\SetExtraSpacing` [`<options>`] {`<set of fonts>`} {`<spacing settings>`}

This command allows you to fine tune the interword spacing (also known as glue). A preliminary remark on what a 'space' is may be in order: between two words, `TEX` will insert a so called glue, which is characterised by three parameters – the normal distance between two words, the maximum amount of space that may be added to it, and the maximum amount that may be subtracted. The latter two parameters come into effect whenever `TEX` tries to break a paragraph into lines and does not succeed; it can then stretch or shrink the spaces between words. These three parameters are specific to each font.

On top of these glue dimensions, `TEX` has the concept of 'space factors'. They may be used to increase the space after certain characters, most prominently the punctuation characters. If `pdfTEX`'s additional spacing adjustment is in effect, space factors are ignored, since it may be considered an extension to space factors with much finer control.

The `spacing settings` are declared as pairs of `<character>` = `<spacing factors>`, where the latter consist of three numbers: first, the additional kern inserted after this character if it appears before an interword space, second, the additional stretch amount, and third, the additional shrink amount. All values may also be negative, in which case the dimensions will be decreased. Not all values have to be specified, however, the settings must contain the two separating commas.

Options:

`name, load, factor, preset, inputenc, context` These options serve the same function as in the previous configuration commands.

unit You can specify the unit by which the specified numbers are measured. Possible values are: character, a *dimension* and, additionally, space. The latter will measure the values in thousandths of the respective space dimension set by the font. By default, the unit is measured by the space dimensions. For example, with these (nonsensical) settings:

```
\SetExtraSpacing
[ unit = space ] % default
{ font = *//*/*/* }
{
    . = {1000,1000,1000},
}
```

the space inserted after a full stop would be doubled (technically speaking: $2 \times \text{\fontdimen} 2$), as would the maximum stretch and shrink amounts of the interword space ($\text{\fontdimen} 3$ and 4). Conversely, setting all three values to -1000 would completely cancel a space after the respective character.

5.5 Additional kerning

\SetExtraKerning [*options*] {*set of fonts*} {*kerning settings*}

With this command, you can fine tune the extra kerning. In contrast to standard kerning, which is always associated with a *pair* of characters, and to tracking, which specifies the space between *all* characters of a font, the extra kerning relates to single characters, that is, whenever a particular character appears in the text, the specified kerning will be inserted, regardless of which character precedes resp. follows it.

I should not neglect to mention a limitation of this additional kerning: words *immediately following* such a kern (not separated by a space) will not be hyphenated, unless you insert the breakpoints manually, e. g., for kerning after the apostrophe, ‘l ‘apos\-\trophe’. This restriction of pdfTeX will hopefully be lifted soon.

The *kerning settings* are specified as pairs of *character* = *kerning values*, where the latter consist of two values: the kerning added before the character, and the kerning appended after the respective character. Once again, either value may be omitted, but not the separating comma.

Options:

name, load, factor, preset, inputenc These options serve the same function as in the previous configuration commands.

unit Admissible values are: space, character and a *dimension*. By default, the values denote thousandths of 1 em.

context When it comes to kerning settings, this option is especially useful, since it allows to apply settings depending on the current language.

For example, you can find the following settings, intended to be used for documents written in French, in the main configuration file:

```
\SetExtraKerning
[ name      = french-default,
  context   = french,
  unit      = space   ]
{ encoding = {OT1,T1,LY1} }
{
  : = {1000,}, % = \fontdimen2
  ; = {500, }, % ~ \thinspace
  ! = {500, },
  ? = {500, }
}
```

What is the result of these settings? If they are active, like in the current paragraph, a thin space will be inserted in front of each question mark, exclamation mark and semicolon; a normal space in front of the colon. Read section 6 to learn how to activate these settings! This paragraph was input like this :

```
\begin{microtypecontext}{kerning=french}
What is the result of these settings? If they are active, like in the
current paragraph, a thin space will be inserted in front of each
question mark, exclamation mark and semicolon; a normal space in front
of the colon. Read section-\ref{sec:context} to learn how to activate
these settings! This paragraph was input like this:
\end{microtypecontext}
```

5.6 Character inheritance

`\DeclareCharacterInheritance [⟨features⟩] {⟨set of fonts⟩} {⟨inheritance lists⟩}`

In most cases, accented characters should inherit the settings from the respective base character. For example, all of the characters À, Á, Â, Ã, Ä, Å and Ä should probably be protruded by the same (absolute) amount as the character A. Using the command `\DeclareCharacterInheritance`, you may declare such classes of characters, so that you then only have to set up the respective base character. With the optional argument, which may contain a comma-separated list of features, you can confine the scope of the list. Additionally, it accepts the `inputenc` key to set the input encoding for this list. The font set can be declared in the usual way, with the only exception that exactly one encoding must be specified. The inheritance lists are declared as pairs of `⟨base character⟩ = ⟨list of inheriting characters⟩`. Unless you are using a different encoding or a very peculiarly shaped font, there should be no need to change the default character inheritance settings.

In the main configuration file `microtype.cfg` and the other font-specific configuration files, you can find examples of all these commands.

5.7 Configuration files

The default configuration, consisting of inheritance settings, declarations of font sets and alias fonts, and generic protrusion, expansion, spacing and kerning settings, will

Table 3: Fonts with tailored protrusion settings

Font family (NFSS code)	Features	
	Encodings	Shapes
Generic	OT1, T1, LY1, QX, (TS1) ^a	n, (it, sl, sc) ^a
Computer Modern Roman (cmr) ^b	OT1, OT4, T1, T5, LY1, TS1	n, it, sl, sc

be loaded from the file `microtype.cfg`. You may extend this file with custom settings (or load a different configuration file with the ‘config’ option, see section 3.5).

If you are embarking on creating new settings for a font family, you should put them into a separate file, whose name must be: ‘`mt-⟨font family⟩.cfg`’ (e. g., ‘`mt-cmr.cfg`’), and may contain all commands described in the current section 5. These files will be loaded automatically if you are actually using the respective fonts. This package ships with configuration files for a number of font families. Table 3 lists them all.

`\DeclareMicrotypeVariants {⟨list of suffixes⟩}`

On its search for a configuration file, the package will also try to remove from the font name a suffix of one or more letters that denotes a ‘variant’ of the base font (cf. Karl Berry’s [Fontname](#)). This allows it to put settings for, e. g., the fonts padx (expert set), padj (oldstyle numerals) and pad (plain) into one and the same file `mt-pad.cfg`. This command expects a comma-separated list of variant suffixes. The starred version appends the suffix(es) to the existing list. The default declaration in `microtype.cfg` is:

```
\DeclareMicrotypeVariants{x,j,w,a,d,0,1}
```

\DeclareMicrotypeAlias {*font name*} {*alias font*}

This command may be used for fonts that are very similar, or actually the same (for instance if you did not stick to the Berry naming scheme when installing a font). An example would be the Latin Modern fonts, which are derived from Computer Modern, so that it is not necessary to create new settings for them – you could say:

```
\DeclareMicrotypeAlias{lmr}{cmr}
```

which would make the package, whenever it encounters the font `lmr` and does not find settings for it, also try the font `cmr`. In fact, you will find this very line, along with some others, in the default configuration file.

\LoadMicrotypeFile {*font name*}

In rare cases, it might be necessary to load a font configuration file manually, for instance, from within another configuration file, or to be able to extend settings defined in a file that would otherwise not be loaded automatically, or would be loaded too late.¹⁰ This command will load the file ‘`mt-font name.cfg`’.

6 Context-sensitive setup

The `microtype` package also allows to apply different micro-typographic settings to the fonts depending on the context in which they occur. This opens up the space for infinite possibilities of tweaking the document’s appearance.

\microtypecontext {*context assignments*}

This command may be used anywhere in the document (also in the preamble) to change the micro-typographic context in the current group. To each feature (`protrusion`, `expansion`, `tracking`, `spacing` and `kerning`), one context may be assigned. Consequently, only settings with the corresponding ‘`context`’ keyword will be applied.

\begin{microtypecontext} {*context assignments*}

\end{microtypecontext} Like many L^AT_EX commands, it is also available in the form of an environment.

\textmicrotypecontext {*context assignments*} {*general text*}

As another possibility, the command `\textmicrotypecontext` sets the context(s) for the text given in the second argument.

Suppose you want the footnote markers in the text to be protruded by a larger amount. You could define settings for the numbers:

```
\SetProtrusion
[ context = footnote ]
{ font   = *//*/*/*/scriptsize } % adapt if necessary
{ 1 = { ,650}, 2 = { ,400}, 3 = { ,400}, 4 = { ,400}, 5 = { ,400},
  6 = { ,400}, 7 = { ,500}, 8 = { ,400}, 9 = { ,400}, 0 = { ,400} }
```

¹⁰ Font package authors might also want to have a look at the hook `\Microtype@Hook`, described in the implementation part, section 14.4.3.

and have the context changed in the footnote marker command. This command differs among the various classes; for the base classes, e.g., `article`, it would be:

```
\newcommand*\new@makefnmark{\hbox{\@textsuperscript{\normalfont
  \microtypecontext{protrusion=footnote}\@thefnmark}}}
\renewcommand*\@footnotemark{%
  \leavevmode \ifhmode\edef\x@sf{\the\spacefactor}\nobreak\fi
  \new@makefnmark \ifhmode\spacefactor\x@sf\fi \relax}
```

For the `memoir` class, you would additionally have to disable auto-detection of multiple footnotes, which prevents protrusion:

```
\renewcommand*\@makefnmark{\hbox{\@textsuperscript{\normalfont
  \microtypecontext{protrusion=footnote}\@thefnmark}}}
\let\m@mmf@prepare\relax
\let\m@mmf@check\relax
```

Another possibility would be to employ contexts for a language-dependent setup. For instance, if you are writing a text in French, you could add:

```
\microtypecontext{kerning=french}
```

to the preamble. This would have the effect that kerning settings for the French context would be applied to the document. Should parts of the document be in English, you could write:

```
\textmicrotypecontext{kerning=}{English text!}
```

to reset the context, so that the punctuation characters in these parts will not receive any extra kerning.

Instead of adding these commands manually to your document, you may also load `microtype` with the `babel` option (see section 3.5). The current language will then be automatically detected and the contexts set accordingly.

`\DeclareMicrotypeBabelHook {⟨list of babel languages⟩} {⟨context list⟩}`

Naturally, `microtype` does not know about the typographic specialties of every language. This command is a means of teaching it how to adjust the context when a particular language is selected. The main configuration file contains among others the following declaration:

```
\DeclareMicrotypeBabelHook
{french,francais,acadian,canadien}
{kerning=french, spacing=}
```

Consequently, whenever you switch to the French language, the kerning context will be changed to ‘french’ and the spacing context will be reset. This hook only has an effect if the package was loaded with the `babel` option. Currently, `microtype` supports French and Turkish kerning and English spacing (aka. `\nonfrenchspacing`). For unknown languages, all contexts will be reset.

7 Letterspacing revisited

`\textls` [*amount*] {*general text*}

`\textls*` While the tracking feature, described in section 5.3, will apply to sets of fonts, you may also want to letterspace shorter pieces of text, regardless of the font in which they are typeset.¹¹ For such ad-hoc letterspacing, `microtype` introduces two commands that can be used in the same way as L^AT_EX's text commands (independently of whether the tracking option is enabled): `\textls` – which also works in math mode – expects the text in the mandatory argument, while `\lsstyle` will switch on letterspacing for all subsequent fonts until the end of the current group. The starred version of `\textls` does not add any extra kerning before or after the text, which may be useful, e. g., for section titles. By default, each character will be spaced out by $100/1000 \text{em} = 0.1 \text{em}$; this amount may be altered in the optional argument to `\textls`, using the `\SetTracking` command, or globally with the `letterspace` package option, with decreasing significance in this order.

`\lslig` {*ligature*}

Since the commands `\textls` and `\lsstyle` will also evaluate the ‘no ligatures’ key for the respective font, you need not worry about protecting or breaking ligatures with most fonts. However, in certain situations, there may be a conflict of ligatures beginning with the same letter, where some of them should be inhibited, while others should not. When letterspacing text typeset in Fraktur fonts, for example, the ligatures ‘ch’, ‘ck’, ‘tz’ and ‘sz’ (‘ß’) should never be broken up; you also usually see the ‘st’ (‘ſt’) ligature in letterspaced text. Furthermore, at least the `yfonts` package realises the short s (‘ſ’) as the ligature ‘ſ:’. On the other hand, the ‘ct’ ligature and the other ‘long s’ ligatures often found in Fraktur fonts should be suppressed. There are two ways to solve this problem: either don't disable the ‘s’ and/or ‘c’ ligatures and break those that need to be broken up by inserting ‘{\kern0pt}’ or `babel`'s “|” shortcut; or disable them and protect those ligatures that need to be protected by enclosing them in the `\lslig` command. So, the following two solutions have the same result (namely, ‘Müsſichtſloſigkeiten’).

```
\SetTracking[no ligatures={f}]{encoding = LY, family = yfrak}{}
\textfrak{\lsstyle Aus:s{\kern0pt}ichts:los{\kern0pt}igkeit}
```

```
\SetTracking[no ligatures={f,s,c}]{encoding = LY, family = yfrak}{}
\textfrak{\lsstyle Au\lslig{s:}si\lslig{ch:t}\lslig{s:}losigkeit}
```

letterspace.sty These three commands (plus the `letterspace` option, described in section 3.4) are also available with the alternative `letterspace` package, which is in fact a much stripped-down version of `microtype`, omitting support for all the other extensions (and also omitting the possibilities of the `\SetTracking` command – all ‘f’ ligatures will be disabled, inner and outer spacing and outer kerning will be set to the default values described in section 5.3). If you prefer to forgo `microtype`'s specialties, you

¹¹ Letterspacing should be used cautiously; in particular, letterspacing lower-case text is held in abhorrence by honourable typographers. Unless you know what you are doing, you should probably only letterspace small-caps or all-caps. Another just cause may be emphasis in texts typeset in Fraktur fonts.

may load the `letterspace` package instead. Both packages should not be used at the same time.

In contrast to `microtype`, which requires L^AT_EX, the `letterspace` package also works with `eplain` or even only `miniltx`: for use with `eplain`, load the package with `\usepackage` inside the `\begin{packages} ... \end{packages}` environment; with `miniltx` (which does not support package options) simply `\input letterspace.sty`.

8 Disabling ligatures

`\DisableLigatures` [`{characters}`] [`{set of fonts}`]

While completely disabling all ligatures of a font (which will also switch off kerning for this font), purposely *lowers* the micro-typographic quality instead of raising it, it is especially useful for typewriter fonts, so that, e.g., in a T1 encoded font, ‘\texttt{--}’ will indeed be printed as ‘--’, not as ‘-’. `\DisableLigatures` may be used to specify, in the usual way, a set of fonts for which ligatures should be disabled, for example, of the typewriter font in T1 encoding:

```
\DisableLigatures{encoding = T1, family = tt* }
```

It is also possible to disable selected ligatures only. The optional argument may contain a comma-separated list of characters for which the ligature mechanism should be inhibited:

```
\DisableLigatures[?,!]{encoding = T1} % inhibit ?` and !` but not fi, -, », etc.
```

The character that begins the ligature(s) is what matters. This command may only be used in the preamble, and only once. It requires pdfT_EX 1.30 or newer.

9 Hints and caveats

Use settings that match your font. Although the default settings should give reasonable results for most fonts, the particular font you happen to be using may have different character shapes that necessitate more or less protrusion or expansion. In particular, italic letter shapes may differ wildly in different fonts, hence I have decided against providing default protrusion settings for them.

The file `test-microtype.tex` might be of some help when adjusting the protrusion settings for a font.

Don't use too large a value for expansion. Font expansion is a feature that is supposed to enhance the typographic quality of your document by producing a more uniform greyness of the text block (and potentially reducing the number of necessary hyphenations). When expanding or shrinking a font too much, the effect will be turned into the opposite. Expanding the fonts by more than 2%, i.e., setting a stretch limit of more than 20, should be justified by a typographically trained eye. If you are so lucky as to be in the possession of multiple instances of a Multiple Master font, you may set expansion limits to up to 4%.

Don't use font expansion for web documents (with older pdfTeX versions). With pdfTeX versions older than 1.40, each expanded instance of the font will be embedded in the PDF file, hence the file size may increase by quite large a factor (depending on expansion limits and step). Therefore, courtesy and thriftiness of bandwidth command it not to enable font expansion when creating files to be distributed electronically. With pdfTeX 1.40, which uses a different technique of expansion, the file size increase can be neglected.

Settings for Cyrillic/Greek/Thai etc. encodings are not yet included. The default sets of fonts for which the micro-typographic features will be enabled (see table 2) only contain those encodings for which configurations exist. Therefore, if you are using any other encoding (e.g., T2A, LGR etc.), microtype will not apply to these fonts. You have to define and activate a new font set including the encoding(s) you are using (for details, see section 4). For protrusion at least, you would also have to create settings for the fonts in question (see section 5.1). It goes without saying that contributions for these encodings are more than welcome.

Adjustment of interword spacing is still experimental. The implementation of this feature in pdfTeX is not complete, and may not yield the positive effects on the typographical quality you might expect – in certain situations, there may even be undesired side effects. Therefore, the spacing option should not be chosen blindly; it is also recommended to experiment with the settings in order to understand the workings of this feature.

Only employ kerning adjustment if it is customary in the language's typographic tradition. In contrast to protrusion and expansion, additional kerning does not unconditionally improve the micro-typographical quality of your document. You should only switch it on if you are writing a document in a language whose typographic tradition warrants such kerning. If you are, for example, writing an English text, your readers would probably be rather confused by additional spaces before the punctuation characters.

You might want to disable protrusion in the Table of Contents. In unfortunate situations, enabled protrusion might internally alter the line length in the TOC and similar lists in such a way that an excess leader dot will fit in. The solution is to temporarily disable protrusion for the TOC:

```
\microtypesetup{protrusion=false}
\tableofcontents
\microtypesetup{protrusion=true}
```

You might want to disable protrusion in verbatim environments. As you know by now, microtype will by default activate character protrusion for all fonts contained in the font set ‘alltext’. This also includes the typewriter font. Although it does make sense to protrude the typewriter font if it appears in running text (like, for example, in this manual), this is probably not desirable inside the `verbatim` environment. However, microtype has no knowledge about the context that a font appears in but will solely decide by examining its attributes. Therefore, you have to take care of disabling protrusion in `verbatim` environments for yourself (that

is, if you don't want to disable protrusion for the typewriter font altogether, by choosing a different font set). While the `\microtypesetup` command has of course been designed for cases like this, you might find it tiring to repeat it every time if you are using the `verbatim` environment frequently. The following line, added to the document's preamble, would serve the same purpose:

```
\g@addto@macro\verbatim{\microtypesetup{activate=false}}
```

If you are using the `fancyvrb` or the `listings` package, this is not necessary, since their implementation of the corresponding environments will inhibit protrusion anyway.

Compatibility and interaction with other packages: The `microtype` package is supposed to work happily together with all other L^AT_EX packages (except for `pdfcprot`). However, life isn't perfect, so problems are to be expected. Currently, I am aware of the following issues:

- If you want to use 8-bit characters in the configuration, you have to load the `inputenc` package first. Unicode input is also supported (when loading `inputenc` with the `utf8` or the `utf8x` option). When using multiple input encodings in a document, 8-bit characters in the settings will only work reliably if you specify the `inputenc` key.
- When loading the package with the `babel` option, you must load the `babel` package before `microtype`.
- It is currently not possible to create character-specific settings for Chinese/Japanese/Korean fonts. Therefore, the only micro-typographic extension that can be made to work with the `CJK` package is font expansion.

Possible error messages and how to get rid of them:

- ! Font csnameendcsname=cmr10+20 at 10.0pt not loadable: Metric (TFM) file not found.
This error message will occur if you are trying to employ font expansion while creating DVI output. Remember, that *automatic* font expansion only works when running pd^FT_EX in PDF mode. Although expansion is also possible in DVI mode, it requires that all instances of the expanded fonts exist on your T_EX system.
- ! pd^FT_EX error (font expansion): auto expansion is only possible with scalable fonts.
Automatic font expansion has been improved in pd^FT_EX 1.40, in that it now not only works with Type 1 fonts but also with TrueType, OpenType and even non-embedded fonts. The above error message indicates either that you are trying to apply expansion to a bitmap (pk) font, which is still not possible, or that the font isn't found at all, e. g., because of missing map entries.
- Warning: pdflatex: font ptmr8r cannot be expanded (not an included Type1 font)
and the PDF viewer complains about a missing font, e. g., Adobe Reader thusly:
Could not find a font in the Resources dictionary - using Helvetica instead.
With pd^FT_EX versions older than 1.40, font expansion can only be applied if the font is actually embedded in the PDF file. If you get the above error message, your T_EX system is not set up to embed (or 'download') the base PostScript fonts (e. g., Times, Helvetica, Courier). In most T_EX distributions, this can be changed in the file `updmap.cfg` by setting `pdftexDownloadBase14` to true.

- Warning: pdflatex (file ecrm1000+20): Font ecrm1000+20 at 1200 not found
 Furthermore, pdfTeX versions older than 1.40 require Type 1 fonts for automatic font expansion. When you receive a message like the above, you are probably trying to apply font expansion to a bitmap or TrueType font. With older pdfTeX versions, this is only possible if you manually create expanded instances of the fonts.
- ! Font T1/cmr/m/n/10=ecrm1000 at 10.0pt not loaded: Not enough room left.
 Memory parameter ‘font_mem_size’ too small.
- ! TeX capacity exceeded, sorry [maximum internal font number (font_max)=2000].
 Memory parameter ‘font_max’ too small.
- ! TeX capacity exceeded, sorry [PDF memory size (pdf_mem_size)=65536].
 Memory parameter ‘pdf_mem_size’ too small (pdfTeX versions older than 1.30).
 When applying micro-typographic enhancement to a large document with a lot of fonts, pdfTeX may be running out of some kind of memory. It can be increased by setting the respective parameter to a larger value. For web2c-based systems, e.g., TeX Live, change the settings in `texmf.cnf`, for MiKTeX, in the file `miktex.ini` (2.4 or older) resp. `pdflatex.ini` (2.5 or newer).
- pdfTeX warning (font expansion): font should be expanded before its first use
 This warning will occur with pdfTeX versions older than 1.40.4, if tracking and expansion is applied to a font. It is harmless and can be ignored.

10 Contributions

I would be glad to include configuration files for more fonts. Preparing such configurations is quite a time-consuming task and requires a lot of patience. To alleviate this process, this package also includes a test file that can be used to check at least the protrusion settings (`test-microtype.tex`).

If you have created a configuration file for another font, or if you have any suggestions for enhancements in the default configuration files, I would gratefully accept them: w.m.l@gmx.net.

11 Acknowledgments

This package would be pointless if *Hàn Thé Thành* hadn't created the pdfTeX programme in the first place, which introduced the micro-typographic extensions and made them available to the TeX world. Furthermore, I thank him for helping me to improve this package, and not least for promoting it in [Thành 2004](#) and [Thành 2008](#) and elsewhere. I also thank him and the rest of the pdfTeX team for refuting the idea that TeX is dead, and for fixing the bugs I find.

Harald Harders has contributed protrusion settings for Adobe Minion. I would also like to thank him for a number of bug reports and suggestions he had to make. *Andreas Bühmann* has suggested the possibility to specify ranges of font sizes, and resourcefully assisted in implementing this. He also came up with some good ideas for the management of complex configurations. *Ulrich Dirr* has

made numerous suggestions, especially concerning the new extensions of interword spacing adjustment and additional character kerning. My thanks also go to *Maciej Eder* for contributing settings for the QX encoding.

I thank *Philipp Lehman* for adding to his *csquotes* package the possibility to restore the original meanings of all activated characters, thus allowing for these characters to be used in the configuration files. *Peter Wilson* kindly provided a hook in his *ledmac*/*ledpar* packages, so that critical editions can finally also benefit from character protrusion.

Additionally, the following people have reported bugs, made suggestions or helped otherwise (in chronological order): *Tom Kink*, *Herb Schulz*, *Michael Hoppe*, *Gary L. Gray*, *Georg Verwegen*, *Christoph Bier*, *Peter Muthesius*, *Bernard Gaulle* †, *Adam Kucharczyk*, *Mark Rossi*, *Stephan Hennig*, *Michael Zedler*, *Herbert Voß*, *Ralf Stubner*, *Holger Uhr*, *Peter Dyballa*, *Morten Høgholm*, *Steven Bath*, *Daniel Flipo*, *Michalis Miatidis*, *Sven Naumann*, *Ross Hetherington*, *Geoff Vallis*, *Steven E. Harris*, *Karl Berry*, *Peter Meier*, *Nathan Rosenblum*, *Wolfram Schaalo*, *Vasile Gaburici*, *Sveinung Heggen*, *Colin Rourke*, *Maverick Woo* and *Silas S. Brown*.

13 Short history

The comprehensive list of changes can be found in appendix A. The following is a list of all changes relevant in the user land; bug and compatibility fixes are swept under the rug.

2.3d (2009/03/27)

- New default for expansion option ‘step’: 1, if $\text{pdfTeX} \geq 1.40$ [section 3.3]

2.3c (2008/11/11)

- Support for luatex enabled by default

2.3 (2007/12/23)

- New key ‘outer kerning’ for \SetTracking to customise outer kerning [section 5.3]
- Adjust protrusion settings for tracking even if protrusion is not enabled
- New option ‘verbose=silent’ to turn all warnings into mere messages [section 3.5]
- The letterspace package also works with eplain or miniltx [section 7]

2.2 (2007/07/14)

- Improvements to tracking/letterspacing: retain kerning (with $\text{pdfTeX} 1.40.4$); automatically adjust protrusion settings
- New key ‘no ligatures’ for \SetTracking to disable selected or all ligatures (with $\text{pdfTeX} 1.40.4$) [section 5.3]
- New keys ‘spacing’ and ‘outer spacing’ for \SetTracking to customise interword spacing [section 5.3]
- Possibility to expand a font with different parameters (with $\text{pdfTeX} 1.40.4$) [section 5.2]
- New optional argument for \DisableLigatures to disable selected ligatures only [section 8]
- New command $\text{\DeclareMicrotypeVariants}$ to specify variant suffixes [section 5.7]
- New command $\text{\textmicrotypecontext}$ as a wrapper for \microtypecontext [section 6]
- Protrusion settings for Bitstream Letter Gothic

2.1 (2007/01/21)

- New command \lslig to protect ligatures in letterspaced text [section 7]

2.0 (2007/01/14)

- Support for the new extensions of pdfTeX version 1.40: tracking/letterspacing, adjustment of interword spacing (glue), and additional kerning (new commands \SetTracking , \SetExtraSpacing , \SetExtraKerning ; new options ‘tracking’, ‘spacing’, ‘kerning’) [sections 5.3, 5.4, 5.5]
- New commands \textls and \lsstyle for letterspacing, new option ‘letterspace’ [sections 3.4, 7]
- New option ‘babel’ for automatic micro-typographic adjustment to the selected language [sections 3.5, 6]
- New font sets: ‘smallcaps’, ‘footnotesize’, ‘scriptsize’ [section 4; table 2]
- New package ‘letterspace’ providing the commands for robust and hyphenatable letterspacing [section 7]

1.9e (2006/07/28)

- New key ‘`inputenc`’ to specify the lists’ input encodings [section 5]
- Protrusion settings for Euler math fonts

1.9d (2006/05/05)

- Support for the Central European QX encoding (inheritance, generic protrusion settings, contributed by Maciej Eder; protrusion settings for Times)
- Protrusion settings for various Euro symbol fonts (Adobe, ITC, marvosym)
- Support for Unicode input in the configuration (`inputenc/utf8`)

1.9c (2006/02/02)

- Protrusion settings for URW Garamond

1.9a (2005/12/05)

- Defer setup until the end of the preamble; consequently, no need to change font defaults before loading `microtype`, or to put it the other way round, `microtype` may now be loaded at any time
- Inside the preamble, `\microtypesetup` accepts all package options [section 3.6]
- Protrusion settings for T5 encoded Charter

1.9 (2005/10/28)

- New command `\DisableLigatures` to disable ligatures of fonts (requires pdfTeX version 1.30 or later) [section 8]
- New command `\microtypecontext` to change the configuration context; new key ‘`context`’ for the configuration commands [section 6]
- New key ‘`font`’ to add single fonts to the font sets [section 4]
- New key ‘`preset`’ to set all characters to the specified value before loading the lists
- Value ‘`relative`’ renamed to ‘`character`’ for ‘`unit`’ keys
- Support for the Polish OT4 encoding (protrusion, expansion, inheritance)
- Support for the Vietnamese T5 encoding (protrusion, expansion, inheritance)

1.8 (2005/06/23)

- New command `\DeclareMicrotypeSetDefault` to declare the default font sets [section 4]
- New option ‘`config`’ to load a different configuration file [section 3.5]
- New option ‘`unit`’ to measure protrusion factors relative to a dimension instead of the character width [section 5.1]
- Renamed commands from `\..MicroType..` to `\..Microtype..`
- Protrusion settings for AMS math fonts
- Protrusion settings for Times in LY1 encoding completed
- The ‘`allmath`’ font set also includes U encoding
- When using the `ledmac` package, character protrusion will work for the first time ever (requires pdfTeX version 1.30 or later)

1.7 (2005/03/23)

- Possibility to specify ranges of font sizes in the set declarations and protrusion and expansion settings [sections 4, 5]
- New command `\LoadMicrotypeFile` to load a font configuration file manually [section 5.7]

- Hook `\Microtype@Hook` for font package authors [section 14.4.3]
- New option ‘verbose=errors’ to turn all warnings into errors
- Warning when running in draft mode

1.6 (2005/01/24)

- New option ‘factor’ to influence protrusion resp. expansion of all characters of a font or font set [sections 3.2, 5]
- When pdf_TE_X is too old to expand fonts automatically, expansion has to be enabled explicitly, automatic expansion will be disabled [section 3.1]
- Use e-_TE_X extensions, if available

1.5 (2004/12/15)

- When output mode is DVI, font expansion has to be enabled explicitly, automatic expansion will be disabled [section 3.1]
- New option ‘selected’ to enable selected expansion, default: `false` [sections 3.3, 5.2]
- New default for expansion option ‘step’: $4(\min(\text{stretch}, \text{shrink})/5)$ [section 3.3]
- Protrusion settings for Bitstream Charter

1.4 (2004/11/12)

- Set up fonts independently from L_AT_EX font loading
- New option: ‘final’ [section 3.5]

1.2 (2004/10/03)

- New font sets: ‘allmath’ and ‘basicmath’ [section 4; table 2]
- Protrusion settings for Computer Modern Roman math symbols
- Protrusion settings for TS1 encoding completed for Computer Modern Roman and Adobe Garamond

1.1 (2004/09/21)

- Protrusion settings for Adobe Minion, contributed by Harald Harders
- New command: `\DeclareCharacterInheritance` [section 5.6]
- Characters may also be specified as octal or hexadecimal numbers [section 5]

1.0 (2004/09/11)

- First CTAN release

14 Implementation

The `docstrip` modules in this file are:

`driver`: The documentation driver, only visible in the `dtx` file.

`package`: The code for the `microtype` package (`microtype.sty`).

`letterspace`: The code for the `letterspace` package (`letterspace.sty`).

`lua`: Code for `luatEX` (`microtype` only).

`plain`: Code for `eplain`, `miniltx` (`letterspace` only).

`debug`: Code for additional output in the log file.

Used for – surprise! – debugging purposes.

`config`: Surrounds all configuration modules.

`cfg-t`: Surrounds (Latin) text configurations.

`mt`: The main configuration file (`microtype.cfg`).

`bch`: Settings for Bitstream Charter (`mt-bch.cfg`).

`blg`: Settings for Bitstream Letter Gothic (`mt-blg.cfg`).

`cmr`: Settings for Computer Modern Roman (`mt-cmr.cfg`).

`pad`: Settings for Adobe Garamond (`mt-pad.cfg`).

`ppl`: Settings for Palatino (`mt-ppl.cfg`).

`ptm`: Settings for Times (`mt-ptm.cfg`).

`pmn`: Settings for Adobe Minion (`mt-pmn.cfg`).

Contributed by *Harald Harders*.

`ugm`: Settings for URW Garamond (`mt-ugm.cfg`).

`cfg-u`: Surrounds non-text configurations (U encoding).

`msa`: Settings for AMS ‘a’ symbol font (`mt-msa.cfg`).

`msb`: Settings for AMS ‘b’ symbol font (`mt-msb.cfg`).

`euf`: Settings for Euler Fraktur font (`mt-euf.cfg`).

`eur`: Settings for Euler Roman font (`mt-eur.cfg`).

`eus`: Settings for Euler Script font (`mt-eus.cfg`).

`cfg-e`: Surrounds Euro symbol configurations.

`zpeu`: Settings for Adobe Euro symbol fonts (`mt-zpeu.cfg`).

`euroitc`: Settings for ITC Euro symbol fonts (`mt-euroitc.cfg`).

`mvs`: Settings for `marvosym` Euro symbol (`mt-mvs.cfg`).

`test`: A helper file that may be used to create and test protrusion settings (`test-microtype.tex`).

And now for something completely different.

¹ `(*package|letterspace)`

14.1 Preliminaries

\MT@MT This is us.

```

2 \def\MT@MT
3 <package> {microtype}
4 <letterspace> {letterspace}
```

\MT@fix@catcode We have to make sure that the category codes of some characters are correct (the german package, for instance, makes " active). Probably overly cautious. Ceterum censeo: it should be forbidden for packages to change catcodes within the preamble. Polite as we are, we'll restore them afterwards.

```

5 \let\MT@restore@catcodes\@empty
6 \def\MT@fix@catcode#1#2{%
7   \edef\MT@restore@catcodes{%
8     \MT@restore@catcodes
9     \catcode#1 \the\catcode#1\relax
10  }%
11  \catcode#1 #2\relax
12 }
13 <package>\MT@fix@catcode{17}{14}% ^^Q (comment)
14 \MT@fix@catcode{24} {9}% ^^X (ignore)
15 <package>\MT@fix@catcode{33}{12}% !
16 <package>\MT@fix@catcode{34}{12}% "
17 \MT@fix@catcode{36} {3}% $ (math shift)
18 \MT@fix@catcode{39}{12}% '
19 \MT@fix@catcode{42}{12}% *
20 \MT@fix@catcode{43}{12}% +
21 \MT@fix@catcode{44}{12}% ,
22 \MT@fix@catcode{45}{12}% -
23 \MT@fix@catcode{58}{12}% :
24 \MT@fix@catcode{60}{12}% <
25 \MT@fix@catcode{61}{12}% =
26 \MT@fix@catcode{62}{12}% >
27 <package>\MT@fix@catcode{63}{12}% ?
28 \MT@fix@catcode{94} {7}% ^ (superscript)
29 \MT@fix@catcode{96}{12}% ^
30 <package>\MT@fix@catcode{124}{12}% |
```

These are all commands for the outside world. We define them here as blank commands, so that they won't generate an error if we are not running pdfTeX.

```

84   package with the option `verbose=errors'. Consult the documentation\MessageBreak
85   in \'MT@MT.pdf to find out what went wrong.{}}

```

14.1.1 Debugging

\tracingmicrotype Cases for \tracingmicrotype:

```

\MT@dinfo
\MT@dinfo@n1
0: almost none
1: + sets & lists
2: + heirs
3: + slots
4: + factors

```

```

86 (*debug)
87 \MT@warning@n{This is the debug version}
88 \newcount\tracingmicrotype
89 \tracingmicrotype=2
90 \def\MT@info#1{\PackageInfo{\MT@MT{#1}}{\MT@addto@annot{#1}}}
91 \def\MT@info@n#1{\PackageInfo{\MT@MT{#1}\gobble}{\MT@addto@annot{#1}}}
92 \let\MT@vinfo\MT@info@n
93 \def\MT@warning#1{\PackageWarning{\MT@MT{#1}}{\MT@addto@annot{Warning: #1}}}
94 \def\MT@warning@n#1{\PackageWarning{\MT@MT{#1}\gobble}{\MT@addto@annot{Warning: #1}}}
95 \def\MT@dinfo#1#2{\ifnum\tracingmicrotype<#1 \else\MT@info{#2}\fi}
96 \def\MT@dinfo@n#1#2{\ifnum\tracingmicrotype<#1 \else\MT@info@n{#2}\fi}

```

\tracingmicrotypeinpdf Another debug method: font switches can be marked in the PDF file with a small caret, an accompanying popup text box displaying all debug messages.

Cases for \tracingmicrotypeinpdf:

1: show new fonts

2: + show known fonts

```
97 \newcount\tracingmicrotypeinpdf
```

Let's see how it works ...

```
\tracingmicrotypeinpdf=2
```

\MT@pdf@annot \MT@addto@annot \ifMT@inannot During font setup, we save the text for the popup in \MT@pdf@annot. (This requires $\text{pdfTeX} \geq 1.30$.) The pdftexcmds package provides pdfTeX's utility commands in luaTeX, too.

```

98 \RequirePackage{pdftexcmds}
99 \newif\ifMT@inannot \MT@inannottrue
100 \let\MT@pdf@annot@\empty
101 \def\MT@addto@annot#1{\ifnum\tracingmicrotypeinpdf>\z@ \ifMT@inannot
102   {\def\MessageBreak{^J}@spaces%
103    \MT@xadd\MT@pdf@annot{\pdf@escapestring{#1^J}}}\fi\fi}

```

\iftracingmicrotypeinpdffalse With \tracingmicrotypeinpdffalse, the PDF output is (hopefully) identical, but some font switches will not be displayed; otherwise the output is affected, but *all* font switches are visible. In the latter case, we also insert a small kern so that multiple font switches are discernable.

```
104 \newif\iftracingmicrotypeinpdffalse
```

\MT@show@pdfannot A red caret is shown for fonts which are actually set up by *Microtype*, a green one marks fonts that we have already seen. The /Caret annotation requires a viewer for PDF version 1.5 (you could use /Text if you're using an older PDF viewer).

```

105 \def\MT@show@pdfannot#1{%
106   \ifnum\tracingmicrotypeinpdf<#1 \else
107     \iftracingmicrotypeinpdffalse\leavevmode\fi
108     \pdfannot height 4pt width 4pt depth 2pt {%
109       /Subtype/Caret
110       /T(\expandafter\string\font@name)
111       \ifcase#1\or
112         /Subj(New font)/C[1 0 0]
113       \else
114         /Subj(Known font)/C[0 1 0]
115       \fi
116       /Contents(\MT@pdf@annot)
117     }%
118     \iftracingmicrotypeinpdffalse\kern1pt\fi
119     \global\MT@inannotfalse
120   \fi

```

```

121 }
122 (/debug)
123 (/package)

```

14.1.2 Requirements

\MT@plain The letterspace package works with:

- 0: miniltx
- 1: eplain
- 2: L^AT_EX

For plain usage, we have to copy some commands from `latex.ltx`.

```

124 (*plain)
125 \def\MT@plain{2}
126 \ifx\documentclass\undefined
127   \def\MT@plain{1}
128   \def\hmode@bgroup{\leavevmode\bgroup}
129   \def\nfss@text#1{{\mbox{#1}}}
130   \let\@typeset@protect\relax
131   \ifx\epplain\undefined
132     \def\MT@plain{0}
133     \def\PackageWarning#1#2{%
134       \begingroup
135         \newlinechar=10 %
136         \def\MessageBreak{^J(#1)@spaces@spaces@spaces@spaces}%
137         \immediate\write16{^JPackage #1 Warning: #2\on@line.^J}%
138       \endgroup
139     }
140     \def\on@line{ on input line \the\inputlineno}
141     \def@spaces{\space\space\space\space}
142   \fi
143 \fi

```

\MT@requires@latex Better use groups than plain ifs.

```

144 \def\MT@requires@latex#1{%
145   \ifnum\MT@plain<#1 \expandafter\@secondoftwo\else\expandafter\@firstoftwo\fi
146 }
147 (/plain)

```

\MT@pdftex@no pdfT_EX's features for which we provide an interface here haven't always been available, and some specifics have changed over time. Therefore, we have to test which pdfT_EX we're using, if any. \MT@pdftex@no will be used throughout the package to respectively do the right thing.

Currently, we have to distinguish seven cases for pdfT_EX:

- 0: not running pdfT_EX
- 1: pdfT_EX (< 0.14f)
- 2: + micro-typographic extensions (0.14f,g)
- 3: + protrusion relative to 1 em ($\geq 0.14h$)
- 4: + automatic font expansion; protrusion no longer has to be set up first; scale factor fixed to 1000; default \efcode = 1000 (≥ 1.20)
- 5: + \left, right, marginkern, \pdfnoligatures, \pdfstrcmp, \pdfescapestring (≥ 1.30)

- 6: + adjustment of interword spacing; extra kerning; `\letterspacefont`; `\pdfmatch12`; `\pdftracingfonts`; always e-TeX (≥ 1.40)
 7: + `\letterspacefont` doesn't disable ligatures and kerns; `\pdfcopyfont` ($\geq 1.40.4$)

```
148 \def\MT@pdftex@no{0}
```

A hack circumventing the TeX Live 2004 hack which undefines the pdfTeX primitives in the format in order to hide the fact that pdfTeX is being run from the user. This has been *fixed* in TeX Live 2005.

```
149 \ifx\normalpdftexversion\@undefined \else
150   \let\pdftexversion \normalpdftexversion
151   \let\pdftexrevision\normalpdftexrevision
152   \let\pdfoutput \normalpdfoutput
153 \fi
```

Old packages might have let `\pdftexversion` to `\relax`.

```

```

14.1.5 Compatibility

For the record, the following L^AT_EX kernel commands will be modified by `microtype`:

- \pickup@font
- \do@subst@correction
- \add@accent (all in section 14.2.9)
- \showhyphens (in section 14.4.5)

The `wordcount` package redefines the font-switching commands, which will break `microtype`. Since `microtype` doesn’t have an effect on the number of words in the document anyway, we will simply disable ourselves.

```
646 \if@eaded{tex}{wordcount}{%
```

```

647 \MT@warning@n{\Detected the `wordcount' utility.\MessageBreak
648   Disabling `\\MT@MT', since it wouldn't work}%
649 \MT@clear@options\MT@restore@catcodes\endinput}\relax

\MT@setup@ The setup is deferred until the end of the preamble. This has a couple of advantages:
\microtypesetup can be used to change options later on in the preamble, and fonts
don't have to be set up before microtype.

650 (/package)

The ledmac package first saves each paragraph in a box, from which it then splits
off the lines one by one. This will destroy character protrusion. (There aren't any
problems with the lineno package, since it takes a different approach.) — ... —
After much to and fro, the situation has finally settled and there is a fix. Beginning
with pdfTEX version 1.21b together with ledpatch.sty as of 2005/06/02 (v0.4),
character protrusion will work at last.

Peter Wilson was so kind to provide the \l@unhbox@line hook in ledmac to
allow for protrusion. \leftmarginkern and \rightmarginkern are new primitives
of pdfTEX 1.21b (aka. 1.30.0).

\MT@setupfont@hook This hook will be executed every time a font is set up (inside a group).

In the preamble, we check for the packages each time a font is set up. Thus, it will work regardless when the packages are loaded.

Even for packages that don't activate any characters in the preamble (like babel and csquotes), we have to check here, too, in case they were loaded before microtype, and a font is loaded \AtBeginDocument, before microtype. (This is no longer needed, since the complete setup is now deferred until the end of the preamble. However, it is still necessary for defersetup=false.)

```
699 \def\MT@setupfont@hook{%

749     \let\microtypecontext@\gobble
750   (/package)
751     \def\lsstyle{\pdfstringdefWarn\lsstyle}%
752     \def\textls#1{\pdfstringdefWarn\textls}%
753   }%
754 (package) \MT@if@true
755 }
756 (plain) }\relax
757 (*package)
758 \MT@with@package@T{tex4ht}\MT@if@true
759 \ifMT@if@\g@addto@macro\MT@setupfont@hook\MT@restore@p@h\fi

```

The `listings` package makes numbers and letters active,

```

760 \MT@with@package@T{listings}{%
761   \g@addto@macro\MT@cfg@catcodes{%
762     \MT@while@num{"30}{"3A}{\catcode@\tempcnta 12\relax}%
763     \MT@while@num{"41}{"5B}{\catcode@\tempcnta 11\relax}%
764     \MT@while@num{"61}{"7B}{\catcode@\tempcnta 11\relax}%
765   }%

```

... and the backslash (which would lead to problems in `\MT@get@slot`).

```

766 \g@addto@macro\MT@setupfont@hook{%

```

```
767     \catcode`\\\z@
```

When loaded with the `extendedchar` option, `listings` will also redefine 8-bit active characters (`inputenc`). Luckily, this simple redefinition will make them expand to their original definition, so that they could be used in the configuration.

```
768     \let\lst@ProcessLetter\empty
769   }%
770 }
```

Of course, using both `soul`'s and `microtype`'s letterspacing mechanisms at the same time doesn't make much sense. But `soul` can do more, e.g., underlining. The optional argument to `\textls` may not be used.

```
771 (/package)
772 (plain) \MT@requires@latex2{
773   \MT@with@package@T{soul}{%
774     \soulregister{\lsstyle} 0%
775     \soulregister{\textls} 1%
776   }
```

Under plain `TEX`, `soul` doesn't register itself the `LATEX` way, hence we have to use a different test in this case.

```
777 (*plain)
778 }{\ifx\SOUL@\undefined\else
779   \soulregister{\lsstyle} 0%
780   \soulregister{\textls} 1%
781 \fi}
782 (/plain)
783 (*package)
```

Compatibility with the `pinyin` package (from CJK): disable `microtype` in `\py@macron`, which loads a different font for the accent. In older versions of `pinyin` (pre-4.6.0), `\py@macron` had only one argument.

```
784 \MT@with@package@T{pinyin}{%
785   \let\MT@orig@py@macron\py@macron
786   \ifpackagelater{pinyin}{2005/08/11}{%
787     \def\py@macron#1#2{%
788       \let\pickup@font\MT@orig@pickupfont
789       \MT@orig@py@macron{#1}{#2}%
790       \let\pickup@font\MT@pickupfont}%
791   }{%
792     \def\py@macron#1{%
793       \let\pickup@font\MT@orig@pickupfont
794       \MT@orig@py@macron{#1}%
795       \let\pickup@font\MT@pickupfont}%
796   }%
797 }
798 (/package)
799 }
800 (*package)
```

We need a font (the `minimal` class doesn't load one).

```
801 \expandafter\ifx\the\font\nullfont\normalfont\fi
```

14.2 Font Setup

<code>\MT@setupfont</code>	Setting up a font entails checking for each feature whether it should be applied to the current font (<code>\MT@font</code>). But first, We might have to disable stuff when used together with adventurous packages.
----------------------------	---

```
802 \def\MT@setupfont{\MT@setupfont@hook}
```

This will use a copy of the font (allowing for expansion parameter variation and the use of more than one set of protrusion factors for a font within one paragraph).

```
803 \MT@requires@pdftex7
804   {\g@addto@macro{\MT@setupfont{\MT@copy@font}}\relax
```

The font properties must be extracted from `\MT@font`, since the current value of `\f@encoding` and friends may be wrong!

```
805 \g@addto@macro{\MT@setupfont{%
806   \MT@exp@two@c{\MT@split@name\string\MT@font}\@nil
```

Try to find a configuration file for the current font family.

```
807 \MT@exp@one@n{\MT@find@file{\MT@family
808 \ifx{\MT@family}{\empty} \else
809   \MT@exp@one@n{\MT@find@file{\MT@family\fi
```

We have to make sure that `\cf@encoding` expands to the correct value (for later, in `\MT@get@slot`), which isn't the case when `\selectfont` chooses a new encoding (this would be done a second later in `\selectfont`, anyway – three lines, to be exact). (I think, I do not need this anymore – however, I'm too afraid to remove it. ... Oops, I did it. Let's see whether anybody complains.)

```
810 % \ifx{\f@encoding}{\cf@encoding} \else \@@enc@update \fi
811 }
```

Tracking has to come first, since it means actually loading a different font.

```
812 \MT@requires@pdftex6
813   {\g@addto@macro{\MT@setupfont{\MT@tracking}}\relax
814 \g@addto@macro{\MT@setupfont{%
815   \MT@check@font
816   \ifMT@inlist@
817   \debug{\MT@show@pdfannot2}
818   \else
819     \MT@vinfo{Setting up font `{\MT@font}' on@line}%
```

Now we can begin setting up the font for all features that the current pd^FT_EX provides. The following commands are `\let` to `\relax` if the respective feature is disabled via package options.

For versions older than 1.20, protrusion has to be set up first, beginning with 1.20, the order doesn't matter.

```
820 \MT@protrusion
821 \MT@expansion
822 }
```

Interword spacing and kerning (pd^FT_EX 1.40).

```
823 \MT@requires@pdftex6
824   {\g@addto@macro{\MT@setupfont{\MT@spacing\MT@kerning}}\relax
```

Disable ligatures (pd^FT_EX 1.30).

```
825 \MT@requires@pdftex5
826   {\g@addto@macro{\MT@setupfont{\MT@noligatures}}\relax
827 \g@addto@macro{\MT@setupfont{%
```

Debugging.

```
828 \debug{\MT@show@pdfannot1}
```

Finally, register the font so that we don't set it up anew each time.

```
829 \MT@register@font
830 \fi
```

```

831 }

\MT@copy@font   The new \pdfcopyfont command allows to expand a font with different parameters,
\MT@copy@font@  or to use more than one set of protrusion factors for a given font within one para-
                graph. It will be used when we find a context for \SetProtrusion or \SetExpansion
                in the preamble, or when the package has been loaded with the copyfonts option.

832 \let\MT@copy@font\relax
833 \MT@requires@pdftex7{
834 \def\MT@copy@font@{%
\MT@font@copy    For every new protrusion and expansion contexts, we create a new copy.

835 \xdef\MT@font@copy{\csname\MT@font\MT@pr@context\MT@ex@context\endcsname}%

\MT@font@orig   pdfTeX doesn't allow to copy a font that has already been copied and expanded/
                letterspaced. Hence, we have to get the original.

836 \expandafter\ifx\MT@font@copy\relax

859 \MT@font \csname\MT@\@tempa @#1font@list\endcsname
860 \fi
861 }
862 }\relax

```

Here's the promised dirty trick for users of older pdfTeX versions, which works around the problem that the use of the same font with different expansion parameters is prohibited. If you do not want to create a clone of the font setup (this would require duplicating the *tfm/vf* files under a new name, and writing new *fd* files and *map* entries), you can load a minimally larger font for the paragraph in question. E.g., for a document typeset in 10 pt:

\SetExpansion

```
[ stretch = 30,
  shrink = 60,
  step   = 5 ]
{ encoding = *,
  size = 10.001 }
{
\newcommand{\expandpar}[1]{%
  \fontsize{10.001}{\baselineskip}\selectfont #1\par}
%
\expandpar{This paragraph contains an `unnecessary' widow.}
```

Note that the `\expandpar` command can only be applied to complete paragraphs. If you are using Computer Modern Roman, you have to load the `fix-cm` package to be able to select fonts in arbitrary sizes. Finally, the reason I suggest to use a larger font, and not a smaller one, is to prevent a different design size being selected.

```
\MT@split@name      Split up the font name (#6) may be a protrusion/expansion context and/or a
\MT@encoding        letterspacing amount).

1049     \MT@set@pr@heirs
1050   }%
1051 }%
1052 }

```

\MT@scale@to@em Since pdfTeX version 0.14h, we have to adjust the protrusion factors (i. e., convert numbers from thousandths of character width to thousandths of an em of the font). We have to do this *before* setting the inheriting characters, so that the latter inherit the absolute value, not the relative one if they have a differing width (e. g., the ‘ff’ ligature). Unlike `protcode.tex` and `pdfcprot`, we do not calculate with `\lpcode` resp. `\rpcode`, since this would disallow protrusion factors larger than the character width (since `\[1r]pcode`’s limit is 1000). Now, the maximum protrusion is 1 em of the font.

The unit is in `\MT@count`, the desired factor in `\@tempb`, and the result will be returned in `\@tempcntb`.

```

1053 \MT@requires@pdftex3{%
1054   \def\MT@scale@to@em{%
1055     \@tempcntb=\MT@count\relax

```

For really huge fonts (100 pt or so), an arithmetic overflow could occur with vanilla TeX. Using e-Tex, this can’t happen, since the intermediate value is 64 bit, which could only be reached with a character width larger than `\maxdimen`.

```

1056   \MT@scale\@tempcntb \@tempb \MT@dimen@six
1057   \ifnum\@tempcntb=\z@ \else
1058     \MT@scale@factor
1059   \fi
1060 }

```

\MT@get@charwd Get the width of the character. When using e-TeX, we can employ \fontcharwd instead of building scratch boxes.

```

\MT@cfg@catcodes We have to make sure that all characters have the correct category code. Especially, new lines and spaces should be ignored, since files might be loaded in the middle of the document. This is basically \nfss@catcodes (from the L^AT_EX kernel). I've added: & (in tabulars), !, ?, ;, : (french), ,, \$, _, ~, and = (Turkish babel).

OK, now all printable characters up to 127 are 'other'. We hope that letters are always letters and numbers other. (`listings` makes them active, see section 14.1.5.)

We leave ^ at catcode 7, so that stuff like '^ff' remains possible.

```

14.2.8 Translating characters into slots

Get the slot number of the character in the current encoding.

`\MT@get@slot` There are lots of possibilities how a character may be specified in the configuration files, which makes translating them into slot numbers quite expensive. Also, we want to have this as robust as possible, so that the user does not have to solve a sphinx's riddle if anything goes wrong.

`\MT@char` The character is in `\@tempa`, we want its slot number in `\MT@char`.

```
\MT@char@ 2139 \def\MT@get@slot{%
2140   \escapechar`\\
```

```
2141 \let\MT@char@\m@ne
2142 \MT@noresttrue
```

Save unexpanded string in case we need to issue a warning message.

```
2143 \MT@toks=\expandafter{\@tempa}%
```

Now, let's walk through (hopefully) all possible cases.

- It's a letter, a character or a number.

```
2144 \expandafter\MT@is@letter\@tempa\relax\relax
2145 \ifnum\MT@char@ < \z@
```

- It might be an active character, i. e., an 8-bit character defined by `inputenc`. If so, we will expand it here to its L^IC_R form.

```
2146 \MT@exp@two@c\MT@is@active\string\@tempa\@nil
```

- OK, so it must be a macro. We do not allow random commands but only those defined in L^AT_EX's idiosyncratic font encoding scheme:

If $\langle encoding \rangle \langle command \rangle$ (that's *one* command) is defined, we try to extract the slot number.

We must be cautious not to stumble over accented characters consisting of two commands, like `'\i` or `\U\CYRI`, hence, `\string` wouldn't be safe enough.

```
2147 \MT@ifdefed@nTF{\MT@encoding\MT@detokenize@c\@tempa}%
2148 \MT@is@symbol
```

- Now, we'll catch the rest, which hopefully is an accented character (e. g. `\"a`).

```
2149 \expandafter\MT@is@composite\@tempa\relax\relax}%
2150 \ifnum\MT@char@ < \z@
```

- It could also be a `\chardef` command (e. g., the percent character). This seems the least likely case, so it's last.

```
2151 \expandafter\MT@exp@two@c\expandafter\MT@is@char\expandafter
2152 \meaning\expandafter\@tempa\MT@charstring\relax\relax\relax
2153 \fi
2154 \fi

2155 \let\MT@char\MT@char@
2156 \ifnum\MT@char < \z@
2157 \MT@warn@unknown
2158 \else
```

If the user has specified something like `'fi`, or wanted to define a number but forgot to use three digits, we'll have something left of the string. In this case, we issue a warning and forget the complete string.

```
2159 \ifMT@norest \else
2160 \MT@warn@rest
2161 \let\MT@char\m@ne
2162 \fi
2163 \fi
2164 \escapechar\m@ne
2165 }
```

```
\ifMT@norest Test whether all of the string has been used up.
```

```

\MT@is@active Expand an active character. (This was completely broken in v1.7, and only worked by chance before.) We \set@display@protect to translate, e.g., Ä into \"A, that is to whatever it is defined in the inputenc encoding file.

Unfortunately, the (older) inputenc definitions prefer the protected/generic variants (e.g., \copyright instead of \textcopyright), which our parser won't be able to understand. (I'm fed up now, so you have to complain if you really,

really want to be able to write ‘©’ instead of `\textcopyright`, thus rendering your configuration files unportable.)

Unicode characters (`inputenc/utf8,utf8x`) are also supported.

```

2258 }%
2259 }
2260 /x

```

\MT@is@composite Here, we are dealing with accented characters, specified as two tokens.

```

2261 \def\MT@is@composite#1#2\relax{%
2262   \ifx\#2\\ \else

```

Again, we construct a control sequence, this time of the form: $\backslash\backslash\langle encoding\rangle\langle accent\rangle-\langle character\rangle$, e.g., $\backslash\backslash T1"-a$, which we then expand once to see if it is a letter (if it has been defined by \DeclareTextComposite). This should be robust, finally, especially, since we also \detokenize the input instead of only \stringifying it. Thus, we will die gracefully even on wrong Unicode input without utf8.

```

2263   \expandafter\def\expandafter\MT@char\expandafter{\csname\expandafter
2264     \string\csname\MT@encoding\endcsname
2265     \MT@detokenize@n{#1}-\MT@detokenize@n{#2}\endcsname}%
2266   \expandafter\expandafter\expandafter\MT@is@letter\MT@char\relax\relax
2267 \fi
2268 }

```

[What about math? Well, for a moment the following looked like a solution, with \mt@is@mathchar defined accordingly, analogous to \MT@is@char above, to pick up the last two tokens (the \meaning of a \mathchardef-ed command expands to its hexadecimal notation):

```

\def\MT@is@mathchar#1{%
  \if\relax\noexpand#1% it's a macro
    \let\x#1%
  \else % it's a character
    \mathchardef\x=\mathcode`#1\relax
  \fi
  \expandafter\MT@exp@two@c\expandafter\mt@is@mathchar\expandafter
    \meaning\expandafter\x\mt@mathcharstring\relax\relax\relax
}

```

However, the problem is that \mathcodes and \mathchardefs have global scope. Therefore, if they are changed by a package that loads different math fonts, there is no guarantee whatsoever that things will still be correct (e.g., the minus in cmsy when the euler package is loaded). So, no way to go, unfortunately.]

Some warning messages, for performance reasons separated here.

\MT@curr@list@name The type and name of the current list, defined at various places.

```

\MT@set@listname 2269 \def\MT@set@listname{%
  2270   \edef\MT@curr@list@name{\@nameuse{MT@abbr@\MT@feat} list\noexpand\MessageBreak

2303 }

```

14.2.9 Hook into L^AT_EX's font selection

We append `\MT@setupfont` to `\pickup@font`, which is called by L^AT_EX every time a font is selected. We then check whether we've already seen this font, and if not, set it up for micro-typography. This ensures that we will catch all fonts, and that we will not set up fonts more than once. The whole package really hangs on this command.

In contrast to the `pdfcprot` package, it is not necessary to declare in advance which fonts should benefit from micro-typographic treatment. Also, only those fonts that are actually being used will be set up.

For my reference:

- `\pickup@font` is called by `\selectfont`, `\wrong@fontshape`, or `\getanddefine@fonts` (for math).
- `\pickup@font` calls `\define@newfont`.
- `\define@newfont` may call (inside a group!)
 - `\wrong@fontshape`, which in turn will call `\pickup@font`, and thus `\define@newfont` again, or

– `\extract@font`.

- `\get@external@font` is called by `\extract@font`, by itself, and by the substitution macros.

Up to version 1.3 of this package, we were using `\define@newfont` as the hook, which is only called for *new* fonts, and therefore seemed the natural choice. However, this meant that we had to take special care to catch all fonts: we additionally had to set up the default font, the error font (if it wasn't the default font), we had to check for some packages that might have been loaded before `microtype` and were loading fonts, e.g., `jurabib`, `ledmac`, `pifont` (loaded by `hyperref`), `tipa`, and probably many more. Furthermore, we had to include a hack for the `IEEEtran` class which loads all fonts in the class file itself (to fine tune inter-word spacing), and the `memoir` class, too. To cut this short: it seemed to get out of hand, and I decided that it would be better to use `\pickup@font` and decide for ourselves whether we've already seen that font. I hope the overhead isn't too large.

`\MT@font@list` We use a comma separated list.

```
2304 \let\MT@font@list\empty
2305 \let\MT@font\empty
```

All this is done at the beginning of the document. It doesn't work for plain, of course, which doesn't have `\pickup@font`.

```
2306 (/package)
2307 (plain)\MT@requires@lateX2{
2308 \MT@addto@setup{%
```

`\MT@orig@pickupfont` `microtype` also works with CJK in the sense that nothing will break when both packages are used at the same time. However, since CJK has its own way of encoding, it is currently not possible to create character-specific settings. That is, the only feature available with CJK fonts is expansion. (Tracking doesn't really work for other reasons.) Like us, CJK redefines `\pickup@font`.

```
2309 \@ifpackageloaded{CJK} {
2310   \@ifpackagelater{CJK}{2006/10/17} % 4.7.0
2311   { \def\MT@orig@pickupfont{\CJK@ifundefined{\CJK@plane}}
2312     {\def\MT@orig@pickupfont{\@ifundefined{\CJK@plane}}}
2313     \g@addto@macro\MT@orig@pickupfont
2314       {{\expandafter\ifx\font@name\relax\define@newfont\fi}}}
```

`CJKutf8` redefines `\pickup@font` once more (recent versions, in PDF mode, as determined by `ifpdf`, which `CJKutf8` loads).

```
2315 \@ifpackageloaded{CJKutf8} {
2316   {\@ifpackagelater{CJKutf8}{2008/05/22} % 4.8.0
2317     {\ifpdf{\expandafter\@secondoftwo\else\expandafter\@firstoftwo\fi}
2318      {\@firstoftwo}
2319      {\@firstoftwo}
2320      {\g@addto@macro\MT@orig@pickupfont{%
2321        {\expandafter\ifx\csname\curr@fontshape/\f@size/\CJK@plane\endcsname\relax
2322          \define@newfont\else\xdef\font@name{%
2323            \csname\curr@fontshape/\f@size/\CJK@plane\endcsname\fi}}}
2324      {\g@addto@macro\MT@orig@pickupfont{%
2325        {\expandafter\ifx\csname\curr@fontshape/\f@size/\CJK@plane\endcsname\relax
2326          \define@newfont\def\JK@temp{v}%
2327          \ifx\JK@temp\JK@plane
2328            \expandafter\ifx\csname\JK@cmap@\f@family\JK@plane\endcsname\relax
2329              \else\csname\JK@cmap@\f@family\JK@plane\endcsname\fi
2330            \else\JK@addcmap\JK@plane\fi
2331      }}}}}
```

```

2331     \else\xdef\font@name{%
2332         \csname \curr@fontshape\lf@size\endcsname\fi}}
2333     }{
2334     \def\MT@orig@pickupfont{\expandafter\ifx\font@name\relax\define@newfont\fi}
2335     }

```

Check whether `\pickup@font` is defined as expected. The warning issued by `\CheckCommand*` would be a bit too generic.

```

2336     \ifx\pickup@font\MT@orig@pickupfont \else
2337         \MT@warning@n{%
2338             Command \string\pickup@font\space is not defined as expected.%
2339             \MessageBreak Patching it anyway. Some things may break%
2340             (*package)
2341             .\MessageBreak Double-check whether micro-typography is indeed%
2342             \MessageBreak applied to the document.%
2343             \MessageBreak (Hint: Turn on `verbose' mode)%
2344             (/package)
2345         }
2346     \fi

```

`\pickup@font` Then we append our stuff. Everything is done inside a group.

```
2347     \g@addto@macro\pickup@font{\begingroup}
```

If the trace package is loaded, we turn off tracing of microtype's setup, which is extremely noisy.

```

2348     \MT@with@package@T{trace}{\g@addto@macro\pickup@font{\conditionally@traceoff}}
2349     \g@addto@macro\pickup@font{%

2354         (debug)    \MT@addto@annot{(\line \number\inputlineno)}%

```

If `\MT@font` is empty, no substitution has taken place, hence `\font@name` is correct. Otherwise, if they are different, `\font@name` does not describe the font actually used. This test will catch first order substitutions, like `bx` to `b`, but it will still fail if the substituting font is itself substituted.

```

2355     \MT@let@cn\MT@font\MT@subst@\expandafter\string\font@name}%
2356     \ifx\MT@font\relax
2357         \let\MT@font\font@name
2358     \else
2359         \ifx\MT@font\font@name \else
2360         (debug) \MT@addto@annot{= substituted with \MT@font}%
2361             \MT@register@subst@font
2362         \fi
2363     \fi
2364     \MT@setupfont
2365     (/package)
2366     (letterspace) \MT@tracking
2367     \endgroup
2368   }
2369   (*package)

```

`\MT@pickupfont` Remember the patched command for later.

```
2370     \let\MT@pickupfont\pickup@font
```

`\do@subst@correction` Additionally, we hook into `\do@subst@correction`, which is called if a substitution has taken place, to record the name of the ersatz font. Unfortunately, this will only work for one-level substitutions. We have to remember the substitute for the rest of the document, not just for the first time it is called, since we need it every time a

font is letterspaced.

```
2371 \g@addto@macro\do@subst@correction
2372   {\edef\MT@font{\csname curr@fontshape/\f@size\endcsname}%
2373    \MT@glet@nc{\MT@subst@\expandafter\string\font@name}\MT@font}
```

\add@accent
\MT@orig@add@accent Inside \add@accent, we have to disable microtype's setup, since the grouping in the patched \pickup@font would break the accent if different fonts are used for the base character and the accent. Fortunately, L^AT_EX takes care that the fonts used for the \accent are already set up, so that we cannot be overlooking them.

```
2374 \let\MT@orig@add@accent\add@accent
2375 \def\add@accent#1#2{%
2376   \let\pickup@font\MT@orig@pickupfont
2377   \MT@orig@add@accent{#1}{#2}%

2379 }
2380 (/package)
2381 }
2382 (plain)\relax
2383 (*package)
```

Consequently (if all goes well), we are the last ones to change these commands, therefore there is no need to check whether our definition has survived.

\MT@check@font Check whether we've already seen the current font.

```
2384 \def\MT@check@font{\MT@exp@one@n\MT@in@clist\MT@font\MT@font@list}
```

\MT@register@subst@font Register the substituted font.

```
2385 \def\MT@register@subst@font{\xdef\MT@font@list{\MT@font@list\font@name,}}
```

\MT@register@font Register the current font.

```
2386 \def\MT@register@font{\xdef\MT@font@list{\MT@font@list\MT@font,}}
```

14.2.10 Context-sensitive setup

Here are the variants for context-sensitive setup.

\MT@active@features The activated features are stored in this command.

```
2387 \let\MT@active@features\empty
```

\MT@check@font@cx Every feature has its own list of fonts that have already been dealt with. If the font needn't be set up for a feature, we temporarily disable the corresponding setup command. This should be more efficient than book-keeping the fonts in lists associated with the combination of contexts, as we've done it before.

```
2388 \def\MT@check@font@cx{%
2389   \MT@if@true
2390   \MT@map@clist@c\MT@active@features{%
2391     \expandafter\MT@exp@one@n\expandafter\MT@in@clist\expandafter\MT@font
2392     \csname MT@##1\endcsname\context\endcsname\font@list\endcsname
2393     \ifMT@in@list@c
2394       \MT@let@nc{\MT@nameuse{MT@abbr@##1}}\relax
2395     \else
2396       \MT@if@false
2397     \fi
2398   }%
2399   \ifMT@if@ \MT@in@list@true \else \MT@in@list@false \fi
2400 }
```

\MT@register@subst@font@cx Add the substituted font to each feature list.

```
2401 \def\MT@register@subst@font@cx{%
```

```

2402 \MT@map@clist@c\MT@active@features{%
2403   \MT@exp@cs\MT@xadd
2404   {MT@##10\csname MT@##1@context\endcsname font@list}%
2405   {\font@name,}%
2406 }%
2407 }

```

\MT@register@font@cx For each feature, add the current font to the list, unless we didn't set it up.

```

2408 \def\MT@register@font@cx{%
2409   \MT@map@clist@c\MT@active@features{%
2410     \MT@exp@cs\ifx{MT@\@nameuse{MT@abbr@##1}}\relax\else
2411       \MT@exp@cs\MT@xadd
2412       {MT@##10\csname MT@##1@context\endcsname font@list}%
2413       {\MT@font,}%
2414     \def@\tempa{##1}%
2415     \MT@exp@cs\MT@map@tlist@c{MT@##1@doc@contexts}\MT@maybe@rem@from@list
2416   \fi
2417 }%
2418 }

```

\MT@maybe@rem@from@list Recurse through all context font lists of the document and remove the font, unless it's the current context.

```

2419 \def\MT@maybe@rem@from@list#1{%
2420   \MT@ifstreq{\@tempa/#1}{\@tempa\csname MT@\@tempa @context\endcsname}\relax{%
2421     \expandafter\MT@exp@one@n\expandafter\MT@rem@from@c@list\expandafter
2422       \MT@font \csname MT@\@tempa #1font@list\endcsname
2423   }%
2424 }

```

\microtypecontext The user may change the context, so that different setups are possible. This is especially useful for multi-lingual documents.

Inside the preamble, it shouldn't actually do anything but remember it for later.

```

2425 \def\microtypecontext#1{\MT@addto@setup{\microtypecontext{#1}}}
2426 \MT@addto@setup{%
2427   \DeclareRobustCommand\microtypecontext[1]{%
2428     \MT@setup@contexts
2429     \let\MT@reset@context\relax

Font sizes may also be specified as ranges. This has been requested by Andreas
 Bühmann, who has also offered valuable help in implementing this. Now, it is
 for instance possible to set up different lists for fonts with optical sizes. (The
 MinionPro project is trying to do this for the OpenType version of Adobe’s Minion.
 See <http://developer.berlios.de/projects/minionpro/>.)

\MT@get@range Ranges will be stored as triplets of {*lower bound*} {*upper bound*} {*list name*}.

\MT@upper For simple sizes, the upper boundary is –1.

2807   }%
2808 }

```

14.3.5 Fine tuning

The commands `\SetExpansion` and `\SetProtrusion` provide an interface for setting the character protrusion resp. expansion factors for a set of fonts.

`\SetProtrusion` This macro accepts three arguments: [options,] set of font attributes and list of character protrusion factors.

A new macro called `\MT@pr@c@<name>` will be defined to be `\#3` (i. e., the list of characters, not expanded).

```

2809 \def\SetProtrusion{%
2810   \MT@begin@catcodes
2811   \MT@SetProtrusion
2812 }

```

`\MT@SetProtrusion` We want the catcodes to be correct even if this is called in the preamble.

```

\MT@pr@c@name 2813 \newcommand*\MT@SetProtrusion[3] [] {%
\MT@extra@context 2814   \let\MT@extra@context\empty

```

`\MT@permute@list` Parse the optional first argument. We first have to know the name before we can deal with the extra options.

```

2815   \MT@set@named@keys{\MT@pr@c}{\#1}%
2816   (debug)\MT@dinfo{1}{creating protrusion list `"\MT@pr@c@name'`}%
2817   \def\MT@permute@list{\pr@c}%
2818   \setkeys{\MT@cfg}{\#2}%

```

We have parsed the second argument, and can now define macros for all permutations of the font attributes to point to `\MT@pr@c@<name>`, ...

```
2819 \MT@permute
```

... which we can now define to be `\#3`. Here, as elsewhere, we have to make the definitions global, since they will occur inside a group.

```

2820   \MT@gdef@n{\MT@pr@c@{\MT@pr@c@name}}{\#3}%
2821   \MT@end@catcodes
2822 }

```

`\SetExpansion` `\SetExpansion` only differs in that it allows some extra options (stretch, shrink, step, auto).

```

2823 \def\SetExpansion{%
2824   \MT@begin@catcodes
2825   \MT@SetExpansion

```

Protrusion contexts *may* also work without copying the font, so we don't issue an error but only a warning. The problem is that pdfTeX only allows one set of protrusion factors for a given font within one paragraph (those that are in effect at the end of the paragraph will be in effect for the whole paragraph). When different fonts are loaded – like in the example with the footnote markers – we don't need to copy the fonts.

```

14.3.6 Character inheritance

`\DeclareCharacterInheritance`

This macro may be used in the configuration files to declare characters that should inherit protrusion resp. expansion values from other characters. Thus, there is no need to define all accented characters (e.g., `\'a`, `\^a`, `\~a`, `\"a`, `\r{a}`, `\k{a}`, `\u{a}`), which will make the configuration files look much nicer and easier to maintain. If a single character of an inheritance list should have a different value, one can simply override it.

`\MT@inh@feat`

The optional argument may be used to restrict the list to some features, and to specify an input encoding.

```

3093 \renewcommand*\DeclareCharacterInheritance[1][]{%
3094   \let\MT@extra@context\empty
3095   \let\MT@extra@inputenc\undefined
3096   \let\MT@inh@feat\empty
3097   \setkeys{MT@inh@}{#1}%
3098   \MT@begin@catcodes
3099   \MT@set@inh@list
3100 }

```

`\MT@set@inh@list` Safe category codes.

```

3101 \def\MT@set@inh@list#1#2{%
3102   \MT@ifempty{\MT@inh@feat}{%
3103     \MT@map@clist@c\MT@features{{\MT@declare@char@inh##1##2}}%
3104   }{%
3105     \MT@map@clist@c\MT@inh@feat{%

3107       \MT@ifempty@tempa\relax{%
3108         \MT@exp@one@n\MT@declare@char@inh
3109         {\csname MT@rbba@@tempa\endcsname}{##1##2}%
3110       }%
3111     }%
3112   }%
3113   \MT@end@catcodes
3114 }

```

The keys for the optional argument.

```

3115 \MT@map@clist@c\MT@features@long{%
3116   \define@key{MT@inh@}{#1}[]{\edef\MT@inh@feat{\MT@inh@feat#1,}}}
3117 \define@key{MT@inh@}{inputenc}{\def\MT@extra@inputenc{#1}}

```

\MT@declare@char@inh The lists cannot be given a name by the user.

```

3118 \def\MT@declare@char@inh#1#2#3{%
3119   \MT@edef@n{MT@#1@inh@name}%
3120   {(\MT@curr@file/\the\inputlineno (\@nameuse{MT@abbr@#1}))}%
3121   \MT@let@cn\MT@curr@set@name{MT@#1@inh@name}%
3122   \MT@ifdefined@c@T\MT@extra@inputenc{%
3123     \MT@xdef@n{MT@#1@inh@\MT@curr@set@name @inputenc}{\MT@extra@inputenc}}%
3124 debug\MT@dinfo{1}{creating inheritance list `@\nameuse{MT@#1@inh@name}'}%
3125   \MT@edef@n{MT@#1@inh@\csname MT@#1@inh@name\endcsname}{}{#3}%
3126   \def\MT@permute@list{#1@inh}%
3127   \setkeys{MT@inh}{#2}%
3128   \MT@permute
3129 }
```

Parse the second argument. \DeclareCharacterInheritance may also be set up for various combinations.

```

3130 \define@key{MT@inh}{encoding}[]{%
3131   \def\MT@val{#1}%
3132   \expandafter\MT@encoding@check\MT@val,\@nil
3133   \MT@get@highlevel{encoding}%
3134   \MT@edef@n{MT@tempencoding}{\MT@val}%
3135 }
```

\MT@encoding@check But we only allow *one* encoding.

```

3136 \def\MT@encoding@check#1,#2\@nil{%
3137   \MT@ifempty{#2}\relax{%
3138     \edef\MT@val{#1}%
3139     \MT@warning{You may only specify one encoding for character\MessageBreak
3140                 inheritance lists. Ignoring encoding(s) #2}%
3141   }%
3142 }
```

For the rest, we can reuse the key setup from the configuration lists (\Set...).

```

3143 \MT@define@code@key{family}{inh}
3144 \MT@define@code@key{series}{inh}
3145 \MT@define@code@key{shape}{inh}
3146 \MT@define@code@key@size{inh}
3147 \MT@define@code@key@font{inh}
```

\MT@inh@do Now parse the third argument, the inheritance lists. We define the commands \MT@inh@<name>@<slot>, containing the inheriting characters. They will also be translated to slot numbers here, to save some time. The following will be executed only once, namely the first time this inheritance list is encountered (in \MT@set@<feature>@codes).

```

3148 \def\MT@inh@do#1{%
3149   \ifx\relax#1\empty\else
3150     \MT@inh@split #1=\relax
3151     \expandafter\MT@inh@do
3152   \fi
3153 }
```

\MT@inh@split Only gather the inheriting characters here. Their codes will actually be set in \MT@set@<feature>@codes.

```

14.4.2 Reading the configuration file

The package should just work if called without any options. Therefore, expansion will be switched off by default if output is DVI, since it isn't likely that expanded fonts are available. (This grows more important as modern TeX systems have switched to the pdfTeX engine even for DVI output, so that the user might not even be aware of the fact that she's running pdfTeX.)

```

3509 \MT@protrusiontrue
3510 \ifnum\pdfoutput<\@ne \else

```

Also, we only enable expansion by default if pdfTeX can expand the fonts automatically.

```

3511 \MT@requires@pdftex4{

3549 }%
3550 }

```

14.4.3 Hook for other packages

\Microtype@Hook This hook may be used by font package authors, e. g., to declare alias fonts. If it is defined, it will be executed here, i. e., after the main configuration file has been loaded, and before the package options are evaluated.

This hook was needed in versions prior to 1.9a to overcome the situation that (1) the microtype package should be loaded after all font defaults have been set up (hence, using \@ifpackageloaded in the font package was not viable), and (2) checking \AtBeginDocument could be too late, since fonts might already have been loaded, and consequently set up, in the preamble. With the new deferred setup, one could live without this command, however, it remains here since it's simpler than testing whether the package was loaded both in the preamble as well as at the beginning of the document (which is what one would have to do).

Package authors should check whether the command is already defined so that existing definitions by other packages aren't overwritten. Example:

```

\def\MinionPro@MT@Hook{\DeclareMicrotypeAlias{MinionPro-LF}{MinionPro}}
\@ifpackageloaded{microtype}
  \MinionPro@MT@Hook
  {\@ifundefined{Microtype@Hook}
    {\let\Microtype@Hook\MinionPro@MT@Hook}
    {\g@addto@macro\Microtype@Hook{\MinionPro@MT@Hook}}}

```

\MicroType@Hook with a capital T (which only existed in version 1.7) is provided for compatibility reasons. At some point in the future, it will no longer be available, hence it should not be used.

```
3551 \MT@ifdefined@c@T\MicroType@Hook{\MT@warning{%
3552   Command \string\MicroType@Hook\space is deprecated.\MessageBreak
3553   Use \string\Microtype@Hook\space instead}\MicroType@Hook}
3554 \MT@ifdefined@c@T\Microtype@Hook\Microtype@Hook
```

14.4.4 Changing options later

\microtypesetup
\MT@define@optionX Inside the preamble, \microtypesetup accepts the same options as the package (unless `defersetup=false`). In the document body, it accepts the options: protrusion, expansion, activate, tracking, spacing and kerning. Specifying font sets is not allowed.

```
3555 \def\microtypesetup{\setkeys{MT}}
3556 \MT@addto@setup{\def\microtypesetup#1{\setkeys{MTX}{#1}\selectfont}}
3557 \def\MT@define@optionX#1#2{%

```

For DVI output, the user must have explicitly passed the `expansion` option to the package.

```
3704 \ifnum\pdfoutput<\@ne  
3705   \ifMT@opt@expansion \else  
3706     \MT@expansionfalse  
3707   \fi  
3708 \fi
```

`pdfTeX` can create DVI output, too. However, both the DVI viewer and `dvips` need to find actual fonts. Therefore, expansion will only work if the fonts for different degrees of expansion are readily available.

Some packages depend on the value of `\pdfoutput` and will get confused if it is changed after they have been loaded. These packages are, among others: `color`, `graphics`, `hyperref`, `crop`, `contour`, `pstricks` and, as a matter of course, `ifpdf`. Instead of testing for each package (that's not our job), we only say that it was `microtype` that changed it. This must be sufficient!

```
3709 \MT@info@nl{Generating \ifnum\pdfoutput<\@ne DVI \else PDF \fi output%

3981     \ifMT@if@\MT@shorthandoff{Turkish}{:=}\fi
3982     \fi
```

In case babel was loaded before microtype:

```
3983     \MT@set@babel@context\languagename
3984     }{%
3985     \MT@warning@n{You did not load the babel package.\MessageBreak
3986     The `babel' option won't have any effect}
3987     }
3988     \fi
3989 }
```

Now we close the \fi from \ifMT@draft.

```
3990 \MT@addto@setup{\fi}
```

Set up the current font, most likely the normal font. This has to come after all of the setup (including anything from the preamble) has been dealt with.

```
3991 \selectfont
```

\MT@curr@file This is the current file (hopefully with the correct extension).

```
3992 \edef\MT@curr@file{\jobname.tex}
```

Finally, execute the setup macro at the end of the preamble, and empty it (the combine class calls it repeatedly).

```
3993 (/package)
3994 (plain)\MT@requires@lateX{%
3995 \AtBeginDocument{\MT@setup@ \MT@glet\MT@setup@{}@empty}
3996 (plain)} \relax
```

Warning if \nonfrenchspacing is active, since space factors will be ignored with \pdfadjustinterwordglue>0. Why 1500? Because some packages redefine \frenchspacing.¹³ This has to be checked after the setup has taken place. There still will be a false warning if babel is loaded after microtype (without the babel option).

```
3997 (*package)
3998 \MT@requires@pdftex{%

```

¹³ Cf. the c.t.t. thread '\frenchspacing with AMS packages and babel', started by Philipp Lehman on 16 August 2005, MID: ddtbj\$rob\$1@online.de

```

Restore catcodes.
4016 \MT@restore@catcodes

That was that.
4017 (/package|letterspace)

```

15 Configuration files

Let's now write the font configuration files.

```

4018 (*config)
4019

```

15.1 Font sets

We first declare some sets in the main configuration file.

```

4020 (*m-t)
4021 %% -----
4022 %% FONT SETS
4023
4024 \DeclareMicrotypeSet{all}
4025   {}
4026
4027 \DeclareMicrotypeSet{allmath}
4028   { encoding = {OT1,T1,LY1,OT4,QX,T5,TS1,OML,OMS,U} }
4029
4030 \DeclareMicrotypeSet{alltext}
4031   { encoding = {OT1,T1,LY1,OT4,QX,T5,TS1} }
4032
4033 \DeclareMicrotypeSet{basicmath}
4034   { encoding = {OT1,T1,LY1,OT4,QX,T5,OML,OMS},
4035     family   = {rm*,sf*},
4036     series   = {md*},
4037     size     = {normalsize,footnotesize,small,large}
4038   }
4039
4040 \DeclareMicrotypeSet{basictext}
4041   { encoding = {OT1,T1,LY1,OT4,QX,T5},
4042     family   = {rm*,sf*},
4043     series   = {md*},
4044     size     = {normalsize,footnotesize,small,large}
4045   }
4046
4047 \DeclareMicrotypeSet{smallcaps}
4048   { encoding = {OT1,T1,LY1,OT4,QX,T5,TS1},
4049     shape    = {sc}
4050   }
4051
4052 \DeclareMicrotypeSet{footnotesize}
4053   { encoding = {OT1,T1,LY1,OT4,QX,T5,TS1},
4054     size    = {-small}
4055   }
4056
4057 \DeclareMicrotypeSet{scriptsize}
4058   { encoding = {OT1,T1,LY1,OT4,QX,T5,TS1},

```

```

4059     size      = {-footnotefont}
4060   }
4061
4062 \DeclareMicrotypeSet{normal font}
4063   { font = *//*/*/* }
4064

```

The default sets.

```

4065 %% -----
4066 %% DEFAULT SETS
4067
4068 \DeclareMicrotypeSetDefault[protrusion]{alltext}
4069 \DeclareMicrotypeSetDefault[expansion] {basictext}
4070 \DeclareMicrotypeSetDefault[spacing]    {basictext}
4071 \DeclareMicrotypeSetDefault[kerning]   {alltext}
4072 \DeclareMicrotypeSetDefault[tracking]  {smallcaps}
4073

```

15.2 Font variants and aliases

```

4074 %% -----
4075 %% FONT VARIANTS AND ALIASES
4076

```

These are the variants I happen to be using (expert encoding, oldstyle numerals, swashes, alternative, display, inferior and superior numerals):

```

4077 \DeclareMicrotypeVariants{x,j,w,a,d,0,1}
4078

```

Other candidates: 2 (proportional digits), e (engraved), f (Fraktur), g (small text), h (shadow), l (outline), n (informal), p (ornaments), r (roman), s (sans serif), t (typewriter). I've omitted them since they seem hardly be used and/or they are actually more than a variant, i. e., they shouldn't share a file.

Fonts that are ‘the same’: The Latin Modern fonts, the virtual fonts from the ae and zefonts, and the eco and hfoldsty packages (oldstyle numerals) all inherit the (basic) settings from Computer Modern Roman. Some of them are in part overwritten later.

```

4079 \DeclareMicrotypeAlias{lmr} {cmr} % lmodern
4080 \DeclareMicrotypeAlias{aer} {cmr} % ae
4081 \DeclareMicrotypeAlias{zer} {cmr} % zefonts
4082 \DeclareMicrotypeAlias{cmor}{cmr} % eco
4083 \DeclareMicrotypeAlias{hfor}{cmr} % hfoldsty

```

The packages pxfonts and txfonts fonts inherit Palatino and Times settings respectively, also the TeX Gyre fonts Pagella and Termes (formerly: qfonts).

```

4084 \DeclareMicrotypeAlias{pxr} {ppl} % pxfonts
4085 \DeclareMicrotypeAlias{qpl} {ppl} % TeX Gyre Pagella (formerly: qfonts/QuasiPalatino)

```

The ‘FPL Neu’ fonts, a ‘re-implementation’ of Palatino.

```

4086 \DeclareMicrotypeAlias{fp9x}{pplx} % FPL Neu
4087 \DeclareMicrotypeAlias{fp9j}{pplj} % "
4088 \DeclareMicrotypeAlias{txr} {ptm} % txfonts
4089 \DeclareMicrotypeAlias{qtm} {ptm} % TeX Gyre Termes (formerly: qfonts/QuasiTimes)

```

More Times variants, to be checked: pns, mns (TimesNewRomanPS); mnt (TimesNewRomanMT, TimesNRSevenMT), mtm (TimesSmallTextMT); pte (TimesEuropa); ptt (TimesTen); TimesEighteen; TimesModernEF.

The eulervm package virtually extends the Euler fonts.

```
4090 \DeclareMicrotypeAlias{zeur}{eur} % Euler VM
4091 \DeclareMicrotypeAlias{zeus}{eus} % "
```

MicroPress's Charter version (`chmath`).

```
4092 \DeclareMicrotypeAlias{chr}{bch} % CH Math
```

The `mathdesign` package provides math fonts matching Bitstream Charter and URW Garamond.

```
4093 \DeclareMicrotypeAlias{mdbch}{bch} % mathdesign/Charter
4094 \DeclareMicrotypeAlias{mdugm}{ugm} % mathdesign/URW Garamond
```

URW Letter Gothic is similar enough to Bitstream Letter Gothic to share the configuration.

```
4095 \DeclareMicrotypeAlias{ulg}{blg} % URW LetterGothic -> Bitstream LetterGothic12Pitch
```

Euro symbol fonts, to save some files.

```
4096 \DeclareMicrotypeAlias{zpeus}{zpeu} % Adobe Euro sans -> serif
4097 \DeclareMicrotypeAlias{eurosans}{zpeu} % Adobe Euro sans -> serif
4098 \DeclareMicrotypeAlias{euroitcs}{euroitc} % ITC Euro sans -> serif
4099
```

15.3 Interaction with `babel`

Contexts that are to be set when switching to a language.

```
4100 %% -----
4101 %% INTERACTION WITH THE `babel' PACKAGE
4102
4103 \DeclareMicrotypeBabelHook
4104   {english,UKEnglish,british,USenglish,american}
4105   {kerning=, spacing=nonfrench}
4106
4107 \DeclareMicrotypeBabelHook
4108   {french,francais,acadian,canadien}
4109   {kerning=french, spacing=}
4110
4111 \DeclareMicrotypeBabelHook
4112   {turkish}
4113   {kerning=turkish, spacing=}
4114
```

15.4 Note on admissible characters

All printable ASCII characters are allowed in the settings, with the following exceptions (on the left hand side, the replacements on the right):

```
\ : \textbackslash
{ : \textbraceleft
} : \textbraceright
^ : \textasciicircum
% : \%
# : \#
```

Comma and equal sign must be guarded with braces ('{,}', '{=}') to keep `keyval` happy.

Character commands are allowed as far as they have been defined in the proper `LATEX` way, that is, when they have been assigned a slot in the font encoding with `\DeclareTextSymbol` or `\DeclareTextComposite`. Characters defined via `\chardef` are also possible.

Ligatures and \mathchardefed symbols have to be specified numerically. Of course, numerical identification is possible in any other case, too.

8-bit characters are also admissible, provided they have been declared in the input encoding file. They should, however, only be used in private configuration files, where the proper input encoding is guaranteed, or else in combination with the ‘inputenc’ key.

15.5 Character inheritance

First the lists of inheriting characters. We only declare those characters that are the same on *both* sides, i. e., not œ for O.

```
4115 </m-t>
4116 <*m-t | zpeu|mvs>
4117 %% -----
4118 %% CHARACTER INHERITANCE
4119
4120 </m-t | zpeu|mvs>
4121 <*m-t>
```

15.5.1 OT1

Glyphs that should possibly inherit settings on one side only: 012 (‘fi’ ligature), 013 (‘fl’), 014 (‘ffi’), 015 (‘ffl’), Æ, æ, œ, œ.

```
4122 \DeclareCharacterInheritance
4123 { encoding = OT1 }
4124 { f = {011}, % ff
4125   i = {\i},
4126   j = {\j},
4127   O = {\O},
4128   o = {\o}
4129 }
4130
```

15.5.2 T1

Candidates here: 028 (‘fi’), 029 (‘fl’), 030 (‘ffi’), 031 (‘ffl’), 156 (‘IJ’ ligature, since L^AT_EX 2005/12/01 accessible as \IJ), 188 (‘ij’, ‘ij’), Æ, æ, œ, œ.

```
4131 \DeclareCharacterInheritance
4132 { encoding = T1 }
4133 { A = {\`A,\^A,\~A,\\"A,\r A,\k A,\u A},
4134   a = {\`a,\^a,\~a,\\"a,\r a,\k a,\u a},
4135   C = {\c C,\c C,\v C},
4136   c = {\c c,\c c,\v c},

4203   e = {\k e},
4204   f = {011}, % ff
4205   i = {\i},
4206   j = {\j},
4207   L = {\L},
4208   l = {\l},
4209   N = {\'N},
4210   n = {\'n},
4211   O = {\O,\'O},
4212   o = {\o,\'o},
4213   S = {\'S},
4214   s = {\'s},
4215   Z = {\'Z,\.Z},
4216   z = {\'z,\.z}
4217 }
4218

```

15.5.5 QX

The Central European QX encoding.¹⁴ Ligatures: 009 ('fk'), 012 ('fi'), 013 ('fl'), 014 ('ffi'), 015 ('ffl'), Æ, æ, œ, œ.

```

4219 \DeclareCharacterInheritance
4220 { encoding = QX }
4221 { A = {\`A,\^A,\~A,\~A,\k A,\AA},
4222   a = {\`a,\^a,\^a,\~a,\~a,\k a,\aa},
4223   C = {\'C,\c C},
4224   c = {\'c,\c c},
4225   D = {\DH},
4226   E = {\`E,\^E,\^E,\k E},
4227   e = {\`e,\^e,\^e,\k e},
4228   f = {011}, % ff
4229   I = {\`I,\^I,\^I,\\"I,\k I},
4230   i = {\`i,\^i,\^i,\\"i,\k i,\i},
4231   j = {\j},
4232   L = {\L},
4233   l = {\l},
4234   N = {\'N,\~N},
4235   n = {\'n,\~n},
4236   O = {\O,\`O,\^O,\~O,\~O,\\"O},
4237   o = {\o,\`o,\^o,\~o,\~o,\\"o},

```

The Rumanian \textcommabelow accents are actually replacements for the \c variants, which had previously (and erroneously¹⁵) been included in QX encoding. They are still kept for backwards compatibility.

```

4238 S = {\'S,\c S,\textcommabelow S,\v S},
4239 s = {\'s,\c s,\textcommabelow s,\v s},
4240 T = {\c T,\textcommabelow T},
4241 t = {\c t,\textcommabelow t},
4242 U = {\`U,\^U,\^U,\\"U,\k U},
4243 u = {\`u,\^u,\^u,\\"u,\k u},
4244 Y = {\'Y,\\"Y},
4245 y = {\`y,\\"y},

```

¹⁴ Thanks to Maciej Eder.

¹⁵ Cf. <http://tug.org/pipermail/tex-live/2008-August/017204.html>

```

4246     Z = {'\Z', '\.Z', '\v Z'},
4247     z = {'\z', '\.z', '\v z},
4248     . = \textellipsis
4249 }
4250

```

15.5.6 T5

The Vietnamese encoding T5. It is so crowded with accented and double-accented characters that there is no room for any ligatures.

```

4251 \DeclareCharacterInheritance
4252   { encoding = T5 }
4253   { A = {'\A', '\A', '\~A', '\h A', '\d A', '\^A', '\u A',

4281 (/m-t)

```

15.5.7 Euro symbols

Make Euro symbols settings simpler.

```

4282 (*zpeu)
4283 \DeclareCharacterInheritance
4284   { encoding = U,
4285     family = {zpeu,zpeus,eurosans} }
4286   { E = 128 }
4287
4288 (/zpeu)
4289 (*mvs)
4290 \DeclareCharacterInheritance
4291   { encoding = OT1,
4292     family = mvs }
4293   { 164 = {099,100,101} } % \EURhv,\EURcr,\EURtm
4294

```

Since 2006/05/11 (that is, one week after I've added these settings, after the package had been dormant for six years), marvosym's encoding is (correctly) U instead of OT1.

```
4295 \DeclareCharacterInheritance
4296   { encoding = U,
4297     family   = mvs }
4298   { 164 = {099,100,101} }
4299
4300 </mvs>
```

15.6 Tracking

By default, we only disable the ‘f*’ ligatures, for those fonts that have any. Thus, ligatures and especially kerning for all other characters will be retained.

```
4301 <*m-t>
4302 %% -----
4303 %% TRACKING/LETTERSPACING

15.8.2 Italics

To find default settings for italic is difficult, since the character shapes and their behaviour at the beginning or end of line may be wildly different for different fonts. Therefore, we leave the letters away, and only set up the punctuation characters.

15.8.6 Computer Modern math

Now to the math symbols for Computer Modern Roman. Definitions have been extracted from `fontmath.ltx`. I did not spend too much time fiddling with these settings, so they can surely be improved.

The math font ‘operators’ (also used for the `\mathrm` and `\mathbf` alphabets) is OT1/cmr, which we’ve already set up above. It’s declared as:

```

\DeclareSymbolFont{operators}  {OT1}{cmr}  {m}{n}
\SetSymbolFont{operators}{bold}{OT1}{cmr}  {bx}{n}

```

`\mathit` (OT1/cmr/m/it) is also already set up.

There are (for the moment) no settings for `\mathsf` and `\mathtt`.

Math font ‘letters’ (also used as `\mathnormal`) is declared as:

```

\DeclareSymbolFont{letters}    {OML}{cmm}  {m}{it}
\SetSymbolFont{letters}{bold}{OML}{cmm}  {b}{it}

```

```

5874 (*cmr)
5875 \SetProtrusion
5876   [ name      = cmr-math-letters ]

```

```
5877 { encoding = OML,

```

These settings are only a first approximation. The following reasoning is from a mail from *Ulrich Dirr*, who also provided the sample in figure 1. I do not claim to have coped with the task.

'The idea is – analog to the tables for expansion and protrusion – to have tables for optical reduction/expansion of spaces in dependence of the actual character so that the distance between words is optically equal.'

When reducing distances the (weighting) order is:

- after commas

```
6595   {,} = { , -500, 500},
```

- in front of capitals which have optical more room on their left side, e.g., 'A', 'J', 'T', 'V', 'W', and 'Y' [this is not yet possible – RS]
- in front of capitals which have circle/oval shapes on their left side, e.g., 'C', 'G', 'O', and 'Q' [ditto – RS]
- after 'r' (because of the bigger optical room on the righthand side)

```
6596   r = { , -300, 300},
```

- [before or] after lowercase characters with ascenders

```

6597   b = { , -200, 200},
6598   d = { , -200, 200},
6599   f = { , -200, 200},
6600   h = { , -200, 200},
6601   k = { , -200, 200},
6602   l = { , -200, 200},
6603   t = { , -200, 200},

```

- [before or] after lowercase characters with x-height plus descender with additional optical space, e. g., ‘v’ or ‘w’

```
6604     c = { , -100, 100},
6605     p = { , -100, 100},
6606     v = { , -100, 100},
6607     w = { , -100, 100},
6608     z = { , -100, 100},
6609     x = { , -100, 100},
6610     y = { , -100, 100},
```

- [before or] after lowercase characters with x-height plus descender without additional optical space

```
6611     i = { , 50, -50},
6612     m = { , 50, -50},
6613     n = { , 50, -50},
6614     u = { , 50, -50},
```

- after colon and semicolon

```
6615     : = { , 200, -200},
6616     ; = { , 200, -200},
```

- after punctuation which ends a sentence, e. g., period, exclamation mark, question mark

```
6617     . = { , 250, -250},
6618     ! = { , 250, -250},
6619     ? = { , 250, -250}
```

The order has to be reversed when enlarging is needed.’

```
6620 }
6621 }
```

Questions are:

- Is the result really better?
- Is it overdone? (Try with a factor < 1000.)
- Should the first parameter also be used? (Probably.)
- What about quotation marks, parentheses etc.?

Furthermore, there seems to be a pdfTeX bug with spacing in combination with a non-zero \spaceskip (reported by Axel Berger):

```
\parfillskip0pt \rightskip0pt plus 1em \spaceskip\fontdimen2\font
  test test\par
\pdfadjustinterwordglue2 \stbscode\font`t=-50
  test test
\bye
```

15.9.1 Nonfrenchspacing

The following settings simulate \nonfrenchspacing (since space factors will be ignored when spacing adjustment is in effect). They may be used for English contexts.

From the TeXbook:

If the space factor f is different from 1000, the interword glue is computed as follows: Take the normal space glue for the current font, and add the extra space if $f \geq 2000$. [...] Then the stretch component is multiplied by $f/1000$, while the shrink component is multiplied by $1000/f$.

The ‘extra space’ (`\fontdimen 7`) for Computer Modern Roman is a third of `\fontdimen 2`, i.e., 333.

```
6622 \SetExtraSpacing
6623   [ name      = nonfrench-cmr,
6624     load      = default,
6625     context   = nonfrench ]
6626   { encoding  = {OT1,T1,LY1,OT4,QX,T5},
6627     family    = cmr }
6628 }
```

`latex.ltx` has:

```
\def\nonfrenchspacing{
  \sfcode`\. 3000
  \sfcode`\? 3000
  \sfcode`\! 3000
```

```
6629   . = {333,2000,-667},
6630   ? = {333,2000,-667},
6631   ! = {333,2000,-667},
```

```
  \sfcode`\: 2000
```

```
6632   : = {333,1000,-500},
```

```
  \sfcode`\; 1500
```

```
6633   ; = { , 500,-333},
  \sfcode`\, 1250
6634   {,}= { , 250,-200}
```

```
}
```

```
6635 }
6636 }
```

`fontinst`, however, which is also used to create the PSNFSS font metrics, sets `\fontdimen 7` to 240 by default. Therefore, the fallback settings use this value for the first component.

```
6637 \SetExtraSpacing
6638   [ name      = nonfrench-default,
6639     load      = default,
6640     context   = nonfrench ]
6641   { encoding  = {OT1,T1,LY1,OT4,QX,T5} }
6642   {
6643     . = {240,2000,-667},
6644     ? = {240,2000,-667},
6645     ! = {240,2000,-667},
6646     : = {240,1000,-500},
6647     ; = { , 500,-333},
6648     {,}= { , 250,-200}
6649 }
```

```
6650 }
```

```

15.10.1 French

The ratio of `\fontdimen 2` to `\fontdimen 6` varies for different fonts, so that either the kerning of the colon (which should be a space, i.e., `\fontdimen 2`) or that of the other punctuation characters (TeX's `\thinspace`, i.e., one sixth of `\fontdimen 6`) may be inaccurate, depending on which unit we choose (space or 1em). For Times, for example, a thin space would be 665. I don't know whether French typography really wants a thin space, or rather (as it happens to turn out with CMR) half a space. (Wikipedia¹⁸ claims it should be a quarter of an em, which seems too much to me; then again, it also says that this *was* a thin space in French typography.)

```
6659 \SetExtraKerning
6660   [ name      = french-default,
6661     context   = french,
6662     unit      = space  ]
6663   { encoding = {OT1,T1,LY1} }
6664   {
6665     : = {1000,}, % = \fontdimen2
6666     ; = {500, }, % ~ \thinspace
6667     ! = {500, },
6668     ? = {500, }
6669   }
6670
```

These settings have the disadvantage that a word following a left guillemet will not be hyphenated. This might be fixed in pdfTeX.

```
6671 \SetExtraKerning
6672   [ name      = french-guillemets,
6673     context   = french-guillemets,

A Change history

Version 1.0 (2004/09/11)

General: Initial version 1

Version 1.1 (2004/09/21)

General: configuration file names in lowercase (suggested by <i>Harald Harders</i>)	79	\MT@get@basefamily: only remove suffix if it is ‘x’ or ‘j’	81
issue an error instead of a warning, when pdfTeX version is too old for autoexpand	123	\MT@get@listname@: don’t check for empty attributes list	81
remove 8-bit characters from the configuration files (suggested by <i>Harald Harders</i>)	131	\MT@ifempty: fix: use category code 12 for the percent character (reported by <i>Tom Kink</i>)	43
Protrusion: add factors for some more characters settings for Adobe Minion (contributed by <i>Harald Harders</i>)	136	\MT@is@number: numbers may also be specified in hexadecimal or octal (suggested by <i>Harald Harders</i>)	85
\DeclareCharacterInheritance: new command: possibility to specify character inheritance	107	\MT@pdftex@no: fix: version check (reported by <i>Harald Harders</i>)	38
\MT@declare@sets: remove spaces around set name	94	\MT@permute: don’t use sets for empty encoding ..	109
\MT@DeclareSet: remove spaces around first argument	94	\MT@split@codes: fix: allow zero and negative values ..	58
\MT@find@file: fix: also check whether the file for the base font family has already been loaded ..	79	\MT@use@set: remove spaces around set name	98
		\UseMicrotypeSet: remove spaces around first argument	98

Version 1.2 (2004/10/03)

Font sets: declare cmor as an alias of cmr	129	changed	95
new: allmath and basicmath	128	\MT@get@inh@list: fix: set inheritance list \globally to \empty	83
Protrusion: add settings for Computer Modern Roman and Adobe Garamond in TS1 encoding	157	\MT@get@listname@: alternatively check for alias font name	81
add settings for Computer Modern Roman math symbols	162	\MT@get@size: additional magic to catch some errors hijack \set@fontsize instead of \setfontsize ..	96
\MT@encoding@check: check whether only one encoding specified	108	\MT@loop: fix: new macro, used instead of \loop ..	47
\MT@familyalias: define alias font name as an alternative, not as a replacement	55	\MT@maybe@do: also check for alias font name	55
\MT@get@basefamily: also remove ‘w’ (swash capitals)	81	\MT@permute@00000: more sanity checks for \SetProtrusion and \SetExpansion	110
\MT@get@highlevel: check whether defaults have		\MT@setupfont: also search for alias font file	53
		fix: call \@enc@update if necessary	53

Version 1.3 (2004/10/27)

General: fix: specifying load option does no longer require to give a name, too	104	\MT@fix@catcode: check some category codes (compatibility with german)	34
Font sets: declare aer, zer and hfor as aliases of cmr	129	\MT@load@list: check whether list exists	79

Version 1.4 (2004/11/12)

General: check for pdfcprot	50	(OT1, T1, lmr)	142
don’t use scratch registers in global definitions ..	83	\microtypesetup: fix: set the correct levels, and remember them; warning when enabling an option disabled in package options	118
use \pickup@font instead of \define@newfont as the hook for \MT@setupfont	89	\SetExpansion: fix: specifying extra options does no longer require to give a name, too	101
use one instead of five counters	47		
Protrusion: tweak quote characters for cmr variants			

Version 1.4a (2004/11/17)

General: new option: <code>final</code>	115	when reading files (reported by <i>Michael Hoppe</i>)	80
<code>\MT@cfg@catcodes</code> : fix: reset some more catcodes			

Version 1.4b (2004/11/26)

General: fix: set catcodes before reading global configuration file (reported by <i>Christoph Bier</i>)	116	name if encoding failed	56
new message if <code>\pdfoutput</code> is changed	121	<code>\MT@get@basefamily</code> : fix: failed for font names of the form abczz (reported by <i>Georg Verwegen</i>)	81
optimisation: use less <code>\expandafters</code> and <code>\csnames</code>	41	<code>\MT@get@slot</code> : don't define <code>\MT@char</code> globally (save stack problem)	83
Protrusion: harmonise dashes in upshape and italic (cmr, pad, ppl)	136	<code>\MT@fdimen</code> : don't set <code>\MT@count</code> globally (save stack problem)	44
slanted like italics	145	<code>\MT@use@set</code> : don't use undeclared font sets	98
<code>\MT@checklist@family</code> : fix: don't try alias family			

Version 1.5 (2004/12/15)

General: defaults: step: 4 (suggested by <i>Hàn Thé Thành</i>)	115	<code>\MT@cfg@catcodes</code> : reset catcode of '=' (compatibility with Turkish babel)	80
defaults: calculate step as <code>min(stretch,shrink)/5</code>	122	<code>\MT@fix@catcode</code> : reset catcode of '^' (compatibility with chemsym)	34
defaults: turn off expansion for DVI output	121	<code>\MT@get@highlevel</code> : don't test defaults if called after begin document	95
disable automatic expansion for DVI output	122	<code>\MT@scale@factor</code> : warning for factors outside limits	60
new option: <code>selected</code> , by default false (suggested by <i>Hàn Thé Thành</i>)	113	<code>\MT@scale@to@em</code> : don't use <code>\lpcode</code> and <code>\rpcode</code> for the calculation	59
Documentation: add 'Short history'	30	<code>\MT@set@ex@codes</code> : allow non-selected font expansion	65
add note about DVIoutput option	9	<code>\MT@set@pr@codes</code> : adjust protrusion factors before setting the inheriting characters	57
Inheritance: remove <code>\ss</code> from T1 list, add <code>\DJ</code>	131		
Protrusion: settings for Bitstream Charter	137		
<code>\DeclareMicrotypeAlias</code> : remove spaces around arguments	99		

Version 1.6 (2005/01/24)

General: defaults: turn off expansion for old pdfTeX versions	116	improve settings for numbers (pointed out by <i>Peter Muthesius</i>)	139
disable automatic expansion for old pdfTeX versions	123	tune CMR math letters (OML encoding)	162
load a font if none is selected	52	<code>\MT@get@charwd</code> : use e-TeX's <code>\fontcharwd</code> , if available	60
new option: <code>factor</code> , by default 1000	115	<code>\MT@get@inh@list</code> : correct message if <code>selected</code> is false	83
restructure dtx file	128	<code>\MT@set@ex@codes</code> : introduce factor option	65
test whether <code>\pickup@font</code> has changed	91	<code>\MT@set@pr@codes</code> : introduce factor option	57
test whether numeric options receive a number	115	<code>\MT@use@set</code> : retain current set if new set is undeclared	98
use e-TeX's <code>\ifcscname</code> and <code>\ifdef</code> if defined	42	<code>\MT@vinfo</code> : new macro instead of <code>\ifMT@verbose</code>	35
Protrusion: add italic uppercase Greek letters	145		

Version 1.6a (2005/02/02)

Documentation: add table of fonts with tailored protrusion settings	21	reported by <i>Bernard Gaulle</i>	83
<code>\MT@get@slot</code> : completely redone, hopefully more robust (compatible with <code>frenchpro</code> ; problem		<code>\MT@pdftex@no</code> : new macro	37

<code>\MT@get@slot</code> : completely redone, hopefully more robust (compatible with <code>frenchpro</code> ; problem		<code>\MT@reset@ef@codes</code> : only reset <code>\efcodes</code> for older pdfTeX versions	65
--	--	--	----

Version 1.7 (2005/03/23)

General: allow specification of size ranges (suggested by <i>Andreas Bühlmann</i>)	95	fix: remove space after <code>autoexpand</code>	106
disallow automatic expansion if pdfTeX too old	106	modify <code>\showhyphens</code>	123

new value for verbose option: <code>errors</code>	115		
---	-----	--	--

shorter command names	47	test whether $\langle encoding \rangle \{ \dots \}$ is defined	84
warning when running in draft mode	121	$\backslash MT@if@list@exists$: don't define $\backslash MT@#1@c@name$	
Documentation: add hint about compatibility	27	globally, here and elsewhere	82
remove table of match order	12	$\backslash MT@ifdimen$: comparison with 1 to allow size smaller	
Protrusion: fix: remove \backslash from OT1, add		than 1 (suggested by <i>Andreas Bühlmann</i>)	44
$\text{\\textbackslash}lash$ to T1 encoding	140	$\backslash MT@increment$: use e- \TeX 's $\backslash numexpr$ if available	47
$\backslash DeclareMicrotypeAlias$: may also be used inside		$\backslash MT@is@composite$: new macro: construct command	
configuration files	99	for composite character; no uncontrolled expansion	87
$\backslash LoadMicrotypeFile$: new command (suggested by		$\backslash MT@scale$: new macro: use e- \TeX 's $\backslash numexpr$ if avail-	
<i>Andreas Bühlmann</i>)	100	able	47
$\backslash Microtype@Hook$: new command for font package		$\backslash MT@set@ex@codes$: two versions of this macro	65
authors	117	$\backslash MT@split@name$: don't define $\backslash MT@encoding$ &c.	
$\backslash microtypesetup$: fix: warning also when setting to		globally	55
(no)compatibility	118	$\backslash MT@test@ast$: make it simpler	95
$\backslash MT@begin@catcodes$: also use inside configuration		$\backslash MT@try@order$: always check for size, too (suggested	
commands	80	by <i>Andreas Bühlmann</i>)	81
$\backslash MT@cfg@catcodes$: reset catcode of ':' (compatibility		fix: also check for $//\langle series \rangle /\langle shape \rangle //$ (reported by	
with french* packages)	80	<i>Andreas Bühlmann</i>)	81
$\backslash MT@get@listname@$: use $\backslash @t$ for (<i>Andreas Bühlmann's</i>		$\backslash MT@warn@code@too@large$: new macro: type out max-	
idea)	81	imum protrusion factor	61
$\backslash MT@get@slot$: remove backslash hack	83	$\backslash MT@warn@err$: new macro: for verbose=errors	35
test for $\backslash chardef$ ed commands	84		

Version 1.8 (2005/06/23)

General: $\backslash SetProtrusion$: new key: unit	105	$\backslash MT@find@file$: no longer wrap names in commands	79
if font substitution has occurred, set up the substi-		$\backslash MT@get@charwd$: warning for missing (resp. zero-	
tute font, not the selected one	89	width) characters	60
new option: config to load a different main config-		$\backslash MT@get@font@dimen@six$: new macro: test whether	
uration file	116	$\backslash fontdimen 6$ is defined	58
new option: unit, by default character	116	$\backslash MT@get@listname@$: made recursive	81
Documentation: add example for factor option	13	$\backslash MT@get@slot$: fix: expand active characters	84
add example of how to get rid of a widow (sugge-		test whether $\langle encoding \rangle \{ \dots \}$ is defined made more	
ted by <i>Adam Kucharczyk</i>)	15	robust	84
add hint about error messages	27	$\backslash MT@get@unit$: new macro: get unit for codes	62
Font sets: add U encoding to allmath	128	$\backslash MT@in@rlist$: made recursive	46
declare pxr and txr as aliases of ppl resp. ptm .	129	$\backslash MT@is@active$: new macro: translate inputenc-	
Inheritance: remove $\backslash DJ$ from T1 list (it's the same as		defined characters	85
$\backslash DH$)	131	$\backslash MT@is@letter$: warning for non-ASCII characters	85
Protrusion: add LV1 characters for Times	144	$\backslash MT@led@kern$: character protrusion with ledmac	49
settings for AMS math fonts	166	$\backslash MT@map@clist@n$: new macro: used instead of $\backslash @for$	45
verified settings for slanted Computer Modern Ro-		$\backslash MT@map@tlist@n$: new macro: used instead of $\backslash @for$	46
man	151	$\backslash MT@old@cmd$: renamed commands from	
$\backslash add@accent$: fix: disable micro-typographic setup in-		$\backslash ..MicroType..$ to $\backslash ..Microtype..$	35
side $\backslash add@accent$ (reported by <i>Stephan Hennig</i>) .	91	$\backslash MT@pdftex@no$: case 5: pdf \TeX 1.30	37
$\backslash DeclareMicrotypeAlias$: warning when overriding		$\backslash MT@permute@00000$: add ranges to the beginning of	
an alias font	99	the lists	110
$\backslash DeclareMicrotypeSetDefault$: new command: set		$\backslash MT@scale$: fix: remove spaces in e- \TeX variant (repor-	
default font set		ted by <i>Mark Rossi</i>)	47
$\backslash MT@cfg@catcodes$: reset catcodes of the remaining		$\backslash MT@setupfont@hook$: restore $\backslash %$ and $\backslash #$ when	
ASCII characters		hyperref is loaded	50
$\backslash MT@check@rlist$: made recursive	111	restore csquotes's active characters	50
$\backslash MT@curr@list@name$: new macro: current list type		restore percent character if Spanish babel is loaded	50
and name	87	$\backslash MT@split@codes$: get character width once only	58
$\backslash MT@declare@sets$: warning when redefining a set .	94	$\backslash MT@use@set$: fix: remove braces in first line	98
$\backslash MT@define@set@key@$: use comma lists instead of		$\backslash MT@xadd$: simplified	45
token lists	94		

Version 1.9 (2005/10/28)

General: $\backslash DeclareMicrotypeSet$: new key: font	97	$\backslash SetProtrusion$: value 'relative' renamed to	
---	----	--	--

‘character’ for key unit	105	settings for T5 encoded Computer Modern Roman	136
allow context-specific font setup	89	\DisableLigatures: new command: disable ligatures (requires pdf \TeX 1.30)	100
disable expansion if both step and shrink are zero	123	\microtypecontext: new command: change setup context in the document	92
disable microtype setup inside hyperref’s \pdfstringdef (reported by <i>Hàn Thé Thành</i>)	51	\MT@checklist@family: fix: add two missing \expandafters	56
fix: use true as the default value	113	\MT@detokenize@c: fix the \TeX version	43
option unit: rename value relative to character	116	\MT@exp@two@n: new macros: less \expandafters	42
warning if user requested zero step	122	\MT@get@opt: new key ‘preset’ to set all characters to the specified value before loading the lists	62
Documentation: add hint about verbatim environ- ment	26	\MT@is@active: redone: use \set@display@protect	85
add remark about Type 1 fonts required for auto- matic font expansion	8	\MT@is@letter: using \catcode should be more effi- cient than inspecting the \meaning	85
Font sets: add OT4 encoding to text sets	128	\MT@maybe@do: redone	55
add T5 encoding to text sets	128	\MT@pdftex@no: compatibility with \TeX Live hack (re- ported by <i>Herbert Voß</i>)	38
declare qpl and qtm (qfonts, \TeX Gyre) as aliases of ppl resp. ptm	129	\MT@rem@from@clist: new macro: remove an item from a comma list	46
Inheritance: add list for OT4	132	\MT@scale@factor: generalised	60
add list for T5 (requested by <i>Hàn Thé Thành</i>)	134	\MT@toks: use instead of \toks@	39
Protrusion: fix: remove uppercase Greek letters from T1 encoded CMR	141	\SetProtrusion: (et al.) new key: font	101
settings for OT4 encoding (Computer Modern Ro- man, Palatino, Times)	136		

Version 1.9a (2005/12/05)

General: ‘ <i>file name</i> ’/‘ <i>line number</i> ’ as default list name	104	diately (requested by <i>Georg Verwegen</i>)	94
new option: defersetup, by default true	114	\MT@get@highlevel: no longer check whether defaults have changed	95
remove superfluous test whether \pickup@font has changed	91	\MT@ifdefined@c@T: new macros: true case only	42
Documentation: add explanation for error message in DVI mode	27	\MT@ifint: use \pdfmatch if available	43
add explanation for error message with non-Type 1 fonts	27	\MT@ifstreq: use \pdfstrcmp if available	44
Font sets: declare mdbch (mathdesign) as an alias of Charter	130	\MT@in@clist: fix	46
Protrusion: fix: remove ‘_’ from OT1 encoding	141	\MT@info@missing@char: info instead of warning (after <i>Michael Hoppe</i> reported that the ‘fl’ ligature is missing in Palatino SC)	60
settings for T5 encoded Charter	136	\MT@is@feature: new macro: check for pdf \TeX fea- ture	48
\microtypesetup: inside the preamble, accepts all package options	118	\MT@map@clist@n: following $\text{\LaTeX}3$	45
\MT@check@font@cx: optimise context-sensitive setup	91	\MT@permute@@@@: don’t define permutations for unused encodings	109
\MT@define@set@key@: don’t expand variables imme- <td></td> <td>\MT@rem@from@clist: fix</td> <td>46</td>		\MT@rem@from@clist: fix	46
		\MT@setup@: defer setup until the end of the preamble	49

Version 1.9b (2006/01/20)

General: compatibility with listings: sanitise more catcodes (reported by <i>Holger Uhr</i>)	51	add samples of micro-typographic features	4
compatibility with the extendedchar option of the listings package	52	\MT@features: use throughout the package to adjust to beta-ness	48
Documentation: activate expansion in the distributed PDF	1	\MT@ifdimen: use \pdfmatch if available	44
		\MT@warn@code@too@large: fix calculation with present factor	61

Version 1.9c (2006/02/02)

Documentation: add example of how to increase pro- trusion of footnote markers (suggested by <i>Georg Verwegen</i>)	22	\MT@define@code@key@font: fix: context was ignored	103
Protrusion: settings for URW Garamond	137	\MT@define@code@key@size: fix: embrace \MT@tempsize in \csname (bug introduced in v1.9b)	103

Version 1.9d (2006/05/05)

Font sets: md* instead of m series in basic sets	128	\MT@get@font@dimen: warning for zero fontdimen	60
add QX encoding to text sets	128	\MT@get@opt: optimise: don't reset when preset option is set	62
Inheritance: add list for QX encoding (contributed by <i>Maciej Eder</i>)	133	set list name before presetting	62
Protrusion: settings for QX encoding (contributed by <i>Maciej Eder</i>)	142	\MT@is@active: support for Unicode (inputenc/utf8)	86
settings for Euro symbols (Adobe, ITC, marvosym)	174	\MT@setupfont@hook: restore \% and \# when tex4ht is loaded (reported by <i>Peter Dyballa</i>)	50
tweak AMS settings	166	\SetProtrusion: (et al.) optimise: unify keys for mandatory argument	101
\DeclareCharacterInheritance: fix: empty context	107	(et al.) split keys of optional and mandatory argument	101
\MT@detokenize@n: new macro: use \detokenize if available	43	\MT@get@ex@opt: fix: evaluate preset	66

Version 1.9e (2006/07/28)

General: fix: default value for activate: true	113	settings for Euler Roman font	170
Documentation: add hint about unknown encodings	26	\DeclareCharacterInheritance: new key 'inputenc' to set the input encoding	107
include LPPL	197	\MT@rem@from@clist: model after \removeelement	46
Font sets: declare zeur and zeus (eulervm) as aliases of eur resp. eus (euler)	129	\MT@setup@: empty \MT@setup@ after use (compatibility with the combine class)	49
Inheritance: adapt to marvosym's changed encoding	135	\pickup@font: no tracing with trace package	90
Protrusion: complete settings for Euler Fraktur and Script fonts	173	\SetExpansion: new key: inputenc	101
fix: forgotten comma in mt-mvs.cfg; adapt to marvosym's changed encoding	174	\SetProtrusion: (et al.) new key: inputenc	101

Version 1.9f (2006/09/09)

Protrusion: fix: euler-vm did not load euler settings	170	\MT@reset@context: only reset context if it has actually been changed	92
\MT@curr@list@name: fix: \MessageBreak must not be expanded	87	\MT@set@inh@list: fix: forgotten comma in the features list	107
\MT@gdef@n: new macros: global variants	41	\MT@set@named@keys: new macro: set name first, simplify parsing of optional argument	103
\MT@get@inh@list: fix: input encoding must be set after the inheritance list has been parsed	83	\SetProtrusion: (et al.) set catcodes before parsing optional argument	101
\MT@glet: new macro	41		

Version 2.0 (2007/01/14)

General: (beta:1) new option: babel, by default false (language-dependent setup suggested by <i>Ulrich Dörr</i>)	113	Documentation: add hint about how to increase font_max and font_mem_size	28
(beta:1) new option: letterspace, by default 100	115	add hint about warning when tracking and expansion is applied to a font	28
(beta:3) compatibility with soul: register \textls and \lsstyle	52	add remark about 'draft' option disabling microtype (noted by <i>Michalis Miatidis</i>)	9
(beta:8) option 'babel': fix: switch off French babel's shorthands properly (reported by <i>Daniel Flipo</i>)	126	qualify hint about web documents with regard to older pdfTeX versions	25
(beta:8) option 'babel': switch off Turkish babel's shorthands	127	qualify hints about expansion error messages with regard to older pdfTeX versions	27
compatibility with listings: set catcode of backslash to zero (reported by <i>Steven Bath</i>)	51	Font sets: add footnotesize and scriptsize sets	128
maybe disable \MT@noligatures after the preamble	125	add smallcaps set	128
new package letterspace: a stripped-down version, containing the letterspacing commands only	1	\DeclareMicrotypeBabelHook: (beta:1) new command: interaction with babel	100
option 'unit', \SetProtrusion: deprecate value 'relative' completely	105	\lsstyle: (beta:1) new command: letterspacing	72
		(beta:8) fix: font switches don't pose a problem anymore	72
		(beta:8) fix: letterspacing commands may be nested	72

totally redone, using the new \letterspacefont	72	\SetExtraKerning: (beta:1) new command: additional kerning	102
\MT@declare@sets: fix: empty size list when redefining set	94	\SetExtraSpacing: (beta:1) new command: adjustment of interword spacing	102
\MT@is@symbol: made even more robust	86	\SetTracking: new command: tracking	102
\MT@load@inputenc: sanitise catcodes before loading input encoding (problem with listings)	63	\textls: (beta:1) new command: letterspacing starred version: remove spaces around text	77
\MT@pdftex@no: (beta:1) case 6: pdfTeX 1.40	37	\tracingmicrotype@pdf: new debug method: mark all fonts with PDF annotations	36
\MT@split@name: adjust to possible letterspacing	55		

Version 2.1 (2007/01/21)

General: compatibility with CJK: also check for its definition	89	\lslig: new command: protect ligatures in letter-spaced text	73
compatibility with pinyin: disable microtype in \py@macron (reported by Sven Naumann)	52	\MT@get@ls@basefont: redone: use \pdfmatch to make it bullet-proof	73
fix: letterspace package forgot to load keyval	39	\textls: fix: use \hmode@bgroup	77

Version 2.2 (2007/07/14)

General: disable microtype if wordcount is loaded (reported by Ross Hetherington)	48	fix: \-TeX version shouldn't use \x and \y (found by Wiebke Petersen)	44
new option: copyfonts	114	\MT@is@composite: more robust: expand exactly once	87
simplify key declarations	104	\MT@is@symbol: expand once more (for frenchpro)	86
warning if stretch or shrink aren't multiples of step	123	\MT@lsfont: use \font@name, not \MT@font	70
Documentation: add hint about error message with pdfTeX 1.40	27	\MT@maybe@etex: use catcode trickery	41
add hint about extra TOC leader dot (first discovered by Morten Høgholm)	26	\MT@pdftex@no: case 7: pdfTeX 1.40.4	38
add overview	6	\MT@preset@aux@space: generalised	63
logo transparency and amusement	1	\MT@requires@luatex: (basic) support for luaTeX	41
Font sets: declare FPL Neu as an alias of Palatino	129	\MT@set@all@pr: (et al.) allow empty values	58
declare chr (chmath) as an alias of Charter (reported by Geoff Vallis)	130	\MT@set@inputenc@: only load inputenc files if necessary	63
default set for tracking: smallcaps	129	\MT@set@tr@codes: disable ligatures in letterspaced fonts manually (due to change in pdfTeX 1.40.4)	71
Inheritance: remove '-' → '127'	132	possibility to customise interword spacing	70
Protrusion: settings for Bitstream Letter Gothic	137	\MT@setupfont: don't call \@@enc@update anymore	53
Spacing: add sample	175	only add features that are available with the respective pdfTeX	53
Tracking: add ligatures that are to be disabled	135	\MT@setupfont@hook: restore percent character if Galician babel is loaded	50
\DeclareMicrotypeVariants: new command	99	\MT@the@pr@code@tr: adjust protrusion of letter-spaced fonts	58
\DisableLigatures: new optional argument: disable selected ligatures only	100	\MT@tracking: remember fonts that shouldn't be letterspaced	69
\lslig: always defined	73	\MT@tracking@: fix: tracking couldn't be re-enabled	69
\MT@checklist@font: fix: construct font name from characteristics	57	\MT@warn@tracking@DVI: warning when letterspacing in DVI mode	125
\MT@copy@font: optionally work on copies of fonts	54	\MT@with@babel@and@T: also inspect class options	49
\MT@get@basefamily: redone, working on font names and suffixes of arbitrary length	81	\pickup@font: letterspace: setup inside group	90
\MT@get@charwd: subtract letterspacing amount from width	60	\SetTracking: new key 'no ligatures' to disable ligatures of letterspaced fonts	102
\MT@get@ls@basefont: fix again: remember base font in a macro	73	new keys 'spacing' and 'outer spacing' to adjust interword spacing (suggested by Steven E. Harris)	102
\MT@ifdimen: employ luaTeX features if available	44	third argument may be empty	102
\MT@ifint: employ luaTeX features if available	43	\textmicrotypecontext: new command: wrapper around \microtypecontext	92
\MT@ifstreq: employ luaTeX features if available	44		

Version 2.3 (2007/12/23)

General: disable \microtypecontext in hyperref's \pdfstringdef 51	\MT@in@clist: fix: don't use \x (reported by Peter Meier) 46
enable protrusion when tracking is enabled 124	\MT@is@active: support for extended Unicode (inputenc/utf8x resp. ucs) – experimental 86
fix: really switch off Turkish shorthands 127	\MT@noligatures: fix: set evaluation didn't work (bug introduced in 2.2) 78
new value for verbose option: silent (suggested by Karl Berry) 115	\MT@plain: letterspace: support for eplain/miniltx 37
turned some warnings into errors 115	\MT@set@curr@os: adjusting spaces made more reli- able 71
Documentation: add kerning sample 20	\MT@set@tr@codes: also adjust tracking if protrusion is not enabled, and even for letterspace (reported by Stephan Hennig) 71
add letterspacing illustration 17	possibility to customise outer kerning (suggested by Stephan Hennig) 70
\do@subst@correction: remember substitute font for all times (reported by Stephan Hennig) 90	\MT@SetTracking: sanity check for value 102
\lslig: redone: extract outer kerns from current letterspacing amount 73	\MT@tr@outer@l: only change pre outer space if it contains shrink 75
\microtypecontext: made robust (reported by Ste- phan Hennig) 92	
\MT@begin@catcodes: fix: don't disable \KV@osp@def 80	
\MT@define@set@key@font: font: single asterisk means normal font 97	

Version 2.3a (2008/02/29)

General: error messages if pdfTeX is too old for exten- sions 125	\MT@fix@catcode: fix catcodes earlier, and also for the letterspace package 34
fix test for soul under plain TeX 52	\MT@getkey: fix: key=val in class options list 120
Documentation: add hint about babel having to be loaded first 27	\MT@maybe@etex: removed 41
add table of available and enabled features 7	\MT@set@codes: generalised 58
mention soulutf8 29	\MT@setupfont@hook: restore percent character if Mexican babel is loaded 50
Protrusion: adjust LMR quotation marks again 142	

Version 2.3b (2008/06/04)

General: compatibility with CJKutf8: also check for its definition 89	known slots 79
\MT@exp@gcs: new macro: reduce save stack size .. 41	\MT@requires@latex: new macro 37
\MT@font@copy: enable font copies also with protru- sion contexts (reported by Nathan Rosenblum) 54	\MT@set@tr@codes: fix: protrusion adjustment only for new fonts (reported by Wolfram Schaalo) ... 71
\MT@get@size: grouping 96	\MT@tr@outer@l: fix: only in horizontal mode 75
\MT@noligatures@: fix: warning messages for un- known slots 79	make \spaceskip-aware (ragged2e) 75
	\MT@tr@outer@r@: additional test for horizontal mode 76

Version 2.3c (2008/11/11)

General: luaTeX supported by default 39	coding (reported by Vasile Gaburici) 133
Documentation: add hint about partial incompatibil- ity with CJK 27	\MT@detokenize@c: fix: remove last space only (repor- ted by Ulrich Dirr) 43
add hint about spacing being experimental 26	\MT@tr@outer@r@: additional test for horizontal mode (reporting by Sveinung Heggen) 76
Inheritance: add \textcommabelow[STst] to QX en-	

Version 2.3d (2009/03/27)

General: default step: 1 for pdfTeX versions ≥ 1.40 122	\microtypesetup: select font after setup 118
fix pinyin compatibility check (reported by Silas S. Brown) 52	\MT@check@active@set: warning for missing default sets 117
move setup to the very end (for Colin Rourke) .. 127	\MT@lua: update for luaTeX 0.36 41
\ifMT@inannot: use pdftexcmds for debugging 36	\MT@set@tr@codes: allow zero tracking 70
\lssstyle: disable for luaTeX 72	\MT@set@tr@zero: fix: allow switching off tracking (reporting by Ulrich Dirr) 73
make invalid in math mode 72	

\MT@tr@outer@r@: don't use \x (reported by <i>Ulrich Dirr</i>)	76	Maverick Woo)	76
fix: don't adjust in math mode (reported by <i>Christopher Bier</i>)	75	\MT@tr@set@okern: allow empty value for outer kerning	78
fix: don't adjust inside discretionary (reported by		\textls: make math mode aware	77

B Index

Links (in blue) refer to the page where the corresponding entry is described (bold face) resp. occurs. Plain numbers (in black) refer to the code line where the corresponding entry is defined (underlined) resp. used.

C The LATEX Project Public License

LPPL Version 1.3c 2006-05-20

Copyright 1999, 2002–2006 LATEX3 Project

Everyone is allowed to distribute verbatim copies of this license document, but modification of it is not allowed.

Preamble

The LATEX Project Public License (LPPL) is the primary license under which the the LATEX kernel and the base LATEX packages are distributed.

You may use this license for any work of which you hold the copyright and which you wish to distribute. This license may be particularly suitable if your work is TeX-related (such as a LATEX package), but it is written in such a way that you can use it even if your work is unrelated to TeX.

The section ‘WHETHER AND HOW TO DISTRIBUTE WORKS UNDER THIS LICENSE’, below, gives instructions, examples, and recommendations for authors who are considering distributing their works under this license.

This license gives conditions under which a work may be distributed and modified, as well as conditions under which modified versions of that work may be distributed.

We, the LATEX3 Project, believe that the conditions below give you the freedom to make and distribute modified versions of your work that conform with whatever technical specifications you wish while maintaining the availability, integrity, and reliability of that work. If you do not see how to achieve your goal while meeting these conditions, then read the document ‘cfgguide.tex’ and ‘modguide.tex’ in the base LATEX distribution for suggestions.

Definitions

In this license document the following terms are used:

Work: Any work being distributed under this License.

Derived Work: Any work that under any applicable law is derived from the Work.

Modification: Any procedure that produces a Derived Work under any applicable law – for example, the production of a file containing an original file associated with the Work or a significant portion of such a file, either verbatim or with modifications and/or translated into another language.

Modify: To apply any procedure that produces a Derived Work under any applicable law.

Distribution: Making copies of the Work available from one person to another, in whole or in part. Distribution includes (but is not limited to) making any electronic components of the Work accessible by file transfer protocols such as FTP or HTTP or by shared file systems such as Sun’s Network File System (NFS).

Compiled Work: A version of the Work that has been processed into a form where it is directly usable on a

computer system. This processing may include using installation facilities provided by the Work, transformations of the Work, copying of components of the Work, or other activities. Note that modification of any installation facilities provided by the Work constitutes modification of the Work.

Current Maintainer: A person or persons nominated as such within the Work. If there is no such explicit nomination then it is the ‘Copyright Holder’ under any applicable law.

Base Interpreter: A program or process that is normally needed for running or interpreting a part or the whole of the Work.

A Base Interpreter may depend on external components but these are not considered part of the Base Interpreter provided that each external component clearly identifies itself whenever it is used interactively. Unless explicitly specified when applying the license to the Work, the only applicable Base Interpreter is a ‘LATEX-Format’ or in the case of files belonging to the ‘LATEX-format’ a program implementing the ‘TeX language’.

Conditions on Distribution and Modification

1. Activities other than distribution and/or modification of the Work are not covered by this license; they are outside its scope. In particular, the act of running the Work is not restricted and no requirements are made concerning any offers of support for the Work.
2. You may distribute a complete, unmodified copy of the Work as you received it. Distribution of only part of the Work is considered modification of the Work, and no right to distribute such a Derived Work may be assumed under the terms of this clause.
3. You may distribute a Compiled Work that has been generated from a complete, unmodified copy of the Work as distributed under Clause 2 above, as long as that Compiled Work is distributed in such a way that the recipients may install the Compiled Work on their system exactly as it would have been installed if they generated a Compiled Work directly from the Work.
4. If you are the Current Maintainer of the Work, you

may, without restriction, modify the Work, thus creating a Derived Work. You may also distribute the Derived Work without restriction, including Compiled Works generated from the Derived Work. Derived Works distributed in this manner by the Current Maintainer are considered to be updated versions of the Work.

5. If you are not the Current Maintainer of the Work, you may modify your copy of the Work, thus creating a Derived Work based on the Work, and compile this Derived Work, thus creating a Compiled Work based on the Derived Work.
6. If you are not the Current Maintainer of the Work, you may distribute a Derived Work provided the following conditions are met for every component of the Work unless that component clearly states in the copyright notice that it is exempt from that condition. Only the Current Maintainer is allowed to add such statements of exemption to a component of the Work.
 - (a) If a component of this Derived Work can be a direct replacement for a component of the Work when that component is used with the Base Interpreter, then, wherever this component of the Work identifies itself to the user when used interactively with that Base Interpreter, the replacement component of this Derived Work clearly and unambiguously identifies itself as a modified version of this component to the user when used interactively with that Base Interpreter.
 - (b) Every component of the Derived Work contains prominent notices detailing the nature of the changes to that component, or a prominent reference to another file that is distributed as part of the Derived Work and that contains a complete and accurate log of the changes.
 - (c) No information in the Derived Work implies that any persons, including (but not limited to) the authors of the original version of the Work, provide any support, including (but not limited to) the reporting and handling of errors, to recipients of the Derived Work unless those persons have stated explicitly that they do provide such support for the Derived Work.
 - (d) You distribute at least one of the following with the Derived Work:
 - i. A complete, unmodified copy of the Work; if your distribution of a modified component is made by offering access to copy the modified component from a designated place, then offering equivalent access to copy the Work from the same or some similar place meets this condition, even though third parties are not compelled to copy the Work along with the modified component;
 - ii. Information that is sufficient to obtain a complete, unmodified copy of the Work.
7. If you are not the Current Maintainer of the Work, you may distribute a Compiled Work generated from a Derived Work, as long as the Derived Work is distributed to all recipients of the Compiled Work, and as long as the conditions of Clause 6, above, are met with regard to the Derived Work.
8. The conditions above are not intended to prohibit, and hence do not apply to, the modification, by any method, of any component so that it becomes identical to an updated version of that component of the Work as it is distributed by the Current Maintainer under Clause 4, above.
9. Distribution of the Work or any Derived Work in an alternative format, where the Work or that Derived Work (in whole or in part) is then produced by applying some process to that format, does not relax or nullify any sections of this license as they pertain to the results of applying that process.
10. (a) A Derived Work may be distributed under a different license provided that license itself honors the conditions listed in Clause 6 above, in regard to the Work, though it does not have to honor the rest of the conditions in this license.
 - (b) If a Derived Work is distributed under a different license, that Derived Work must provide sufficient documentation as part of itself to allow each recipient of that Derived Work to honor the restrictions in Clause 6 above, concerning changes from the Work.
11. This license places no restrictions on works that are unrelated to the Work, nor does this license place any restrictions on aggregating such works with the Work by any means.
12. Nothing in this license is intended to, or may be used to, prevent complete compliance by all parties with all applicable laws.

No Warranty

There is no warranty for the Work. Except when otherwise stated in writing, the Copyright Holder provides the Work ‘as is’, without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the quality and performance of the Work is with you. Should the Work prove defective, you assume the cost of all necessary servicing, repair, or correction.

In no event unless required by applicable law or agreed to in writing will The Copyright Holder, or any author named in the components of the Work, or any other party who may distribute and/or modify the Work as permitted above, be liable to you for damages, including any general, special, incidental or consequential damages arising out of any use of the Work or out of inability to use the Work (including, but not limited to, loss of data, data being rendered inaccurate, or losses sustained by

anyone as a result of any failure of the Work to operate with any other programs), even if the Copyright Holder

or said author or said other party has been advised of the possibility of such damages.

Maintenance of The Work

The Work has the status ‘author-maintained’ if the Copyright Holder explicitly and prominently states near the primary copyright notice in the Work that the Work can only be maintained by the Copyright Holder or simply that it is ‘author-maintained’.

The Work has the status ‘maintained’ if there is a Current Maintainer who has indicated in the Work that they are willing to receive error reports for the Work (for example, by supplying a valid e-mail address). It is not required for the Current Maintainer to acknowledge or act upon these error reports.

The Work changes from status ‘maintained’ to ‘unmaintained’ if there is no Current Maintainer, or the person stated to be Current Maintainer of the work cannot be reached through the indicated means of communication for a period of six months, and there are no other significant signs of active maintenance.

You can become the Current Maintainer of the Work by agreement with any existing Current Maintainer to take over this role.

If the Work is unmaintained, you can become the Current Maintainer of the Work through the following steps:

1. Make a reasonable attempt to trace the Current Maintainer (and the Copyright Holder, if the two differ) through the means of an Internet or similar search.
2. If this search is successful, then enquire whether the Work is still maintained.
 - (a) If it is being maintained, then ask the Current Maintainer to update their communication data within one month.
 - (b) If the search is unsuccessful or no action to resume active maintenance is taken by the Current

Maintainer, then announce within the pertinent community your intention to take over maintenance. (If the Work is a LATEX work, this could be done, for example, by posting to `comp.text.tex`.)

3. (a) If the Current Maintainer is reachable and agrees to pass maintenance of the Work to you, then this takes effect immediately upon announcement.
- (b) If the Current Maintainer is not reachable and the Copyright Holder agrees that maintenance of the Work be passed to you, then this takes effect immediately upon announcement.
4. If you make an ‘intention announcement’ as described in 2b above and after three months your intention is challenged neither by the Current Maintainer nor by the Copyright Holder nor by other people, then you may arrange for the Work to be changed so as to name you as the (new) Current Maintainer.
5. If the previously unreachable Current Maintainer becomes reachable once more within three months of a change completed under the terms of 3b or 4, then that Current Maintainer must become or remain the Current Maintainer upon request provided they then update their communication data within one month.

A change in the Current Maintainer does not, of itself, alter the fact that the Work is distributed under the LPPL license.

If you become the Current Maintainer of the Work, you should immediately provide, within the Work, a prominent and unambiguous statement of your status as Current Maintainer. You should also announce your new status to the same pertinent community as in 2b above.

Whether and How to Distribute Works under This License

This section contains important instructions, examples, and recommendations for authors who are considering distributing their works under this license. These authors are addressed as ‘you’ in this section.

LATEX under the GNU General Public License (GPL) was considered inappropriate. Even if your work is unrelated to LATEX, the discussion in ‘modguide.tex’ may still be relevant, and authors intending to distribute their works under any license are encouraged to read it.

Choosing This License or Another License

If for any part of your work you want or need to use *distribution* conditions that differ significantly from those in this license, then do not refer to this license anywhere in your work but, instead, distribute your work under a different license. You may use the text of this license as a model for your own license, but your license should not refer to the LPPL or otherwise give the impression that your work is distributed under the LPPL.

The document ‘modguide.tex’ in the base LATEX distribution explains the motivation behind the conditions of this license. It explains, for example, why distributing

A Recommendation on Modification Without Distribution

It is wise never to modify a component of the Work, even for your own personal use, without also meeting the above conditions for distributing the modified component. While you might intend that such modifications will never be distributed, often this will happen by accident – you may forget that you have modified that component; or it may not occur to you when allowing others to access the modified version that you are thus distributing it and violating the conditions of this license in ways that could have

legal implications and, worse, cause problems for the community. It is therefore usually in your best interest to keep your copy of the Work identical with the public one. Many works provide ways to control the behavior of that work without altering any of its licensed components.

How to Use This License

To use this license, place in each of the components of your work both an explicit copyright notice including your name and the year the work was authored and/or last substantially modified. Include also a statement that the distribution and/or modification of that component is constrained by the conditions in this license.

Here is an example of such a notice and statement:

```
%% pig.dtx
%% Copyright 2005 M. Y. Name
%
% This work may be distributed and/or modified under the
% conditions of the LaTeX Project Public License, either version 1.3
% of this license or (at your option) any later version.
% The latest version of this license is in
%   http://www.latex-project.org/lppl.txt
% and version 1.3 or later is part of all distributions of LaTeX
% version 2005/12/01 or later.
%
% This work has the LPPL maintenance status `maintained'.
%
% The Current Maintainer of this work is M. Y. Name.
%
% This work consists of the files pig.dtx and pig.ins
% and the derived file pig.sty.
```

Given such a notice and statement in a file, the conditions given in this license document would apply, with the ‘Work’ referring to the three files ‘pig.dtx’, ‘pig.ins’, and ‘pig.sty’ (the last being generated from ‘pig.dtx’ using ‘pig.ins’), the ‘Base Interpreter’ referring to any ‘L^AT_EX-Format’, and both ‘Copyright Holder’ and ‘Current Maintainer’ referring to the person ‘M. Y. Name’.

If you do not want the Maintenance section of LPPL to apply to your Work, change ‘maintained’ above into ‘author-maintained’. However, we recommend that you use ‘maintained’ as the Maintenance section was added in order to ensure that your Work remains useful to the community even when you can no longer maintain and support it yourself.

Derived Works That Are Not Replacements

Several clauses of the LPPL specify means to provide reliability and stability for the user community. They therefore concern themselves with the case that a Derived Work is intended to be used as a (compatible or incompatible) replacement of the original Work. If this is not the case (e.g., if a few lines of code are reused for a completely different task), then clauses 6b and 6d shall not apply.

Important Recommendations

Defining What Constitutes the Work

The LPPL requires that distributions of the Work contain all the files of the Work. It is therefore important that you provide a way for the licensee to determine which files constitute the Work. This could, for example, be achieved by explicitly listing all the files of the Work near the copyright notice of each file or by using a line such as:

```
% This work consists of all files listed in manifest.txt.
```

in that place. In the absence of an unequivocal list it might be impossible for the licensee to determine what is considered by you to comprise the Work and, in such a case, the licensee would be entitled to make reasonable conjectures as to which files comprise the Work.
