## 1 Licence, Requirements

Permission is granted to copy, distribute and/or modify this software under the terms of the LaTeX Project Public License, version 1.3 or later (<http://www.latex-project.org/lppl.txt>). This package has the status “maintained.”

**MODIAGRAM** needs and loads the packages `expl3`,<sup>1</sup> `xparse`,<sup>2</sup> `l3keys2e`,<sup>3</sup> `TikZ`<sup>4</sup> and `textgreek`.<sup>5</sup> Additionally the `TikZ` libraries `calc` and `arrows` are loaded. Knowledge of `pgf` or `TikZ` are helpful.

## 2 Motivation

This package has been written as a reaction to a question on <http://tex.stackexchange.com/>. To be more precise: as a reaction to the question “Molecular orbital diagrams in LaTeX.” There it says

I’m wondering if anyone has seen a package for drawing (qualitative) molecular orbital splitting diagrams in LATEX? Or if there exist any packages that can be easily re-purposed to this task?

Otherwise, I think I’ll have a go at it in `TikZ`.

The problem was solved using `TikZ`, since no package existed for that purpose. For one thing **MODIAGRAM** is intended to fill this gap. I also found it very tedious, to make all this copying and pasting when I needed a second, third, . . . diagram. **MODIAGRAM** took care of that.

## 3 Main Commands

All molecular orbital (MO) diagrams are created using the environment `\begin{M0diagram}`  
`\end{M0diagram}`.

---

<sup>1</sup> CTAN: `expl3`    <sup>2</sup> CTAN: `xparse`    <sup>3</sup> CTAN: `l3keys2e`    <sup>4</sup> CTAN: `TikZ`    <sup>5</sup> CTAN: `textgreek`

### 3.1 The `\atom` Command

- `\atom[<name>]{left|right}{<AO-spec>}`  
[`<name>`] caption of the atom;  
`{left|right}` on the left or the right in the diagram;  
`{<AO-spec>}` specifications of the atomic orbitals (AOs).

Let's take a look at an example:

```
1 \begin{M0diagram}
2 \atom[right]{
3   1s = { 0; pair} ,
4   2s = { 1; pair} ,
5   2p = {1.5; up, down }
6 }
7 \end{M0diagram}
```

As you can see, the argument `{<AO-spec>}` is essential to create the actual orbitals and the electrons within. You can use these key/value pairs to specify what you need:

- `1s` = `<rel-energy>; <el-spec>`
- `2s` = `<rel-energy>; <el-spec>`
- `2p` = `<rel-energy>; <x el-spec>, <y el-spec>, <z el-spec>`  
`<el-spec>` can have the values `pair`, `up` and `down` or can be left empty. `<rel-energy>` actually is the `y` coordinate and shifts the AO vertically by `<rel-energy>` cm.

The argument `{left|right}` is important, when p orbitals are used. For instance compare the following example to the one before:

```
1 \begin{M0diagram}
2 \atom[left]{
3   1s = { 0; pair} ,
4   2s = { 1; pair} ,
5   2p = {1.5; up, down }
6 }
7 \end{M0diagram}
```

When both variants are used one can also see, that the right atom is shifted to the right (hence the naming). The right atom is shifted by 4 cm per default and can be adjusted individually, see page 17.

```

1 \begin{M0diagram}
2   \atom{left}{%
3     1s = { 0; pair} ,
4     2s = { 1; pair} ,
5     2p = {1.5; up, down }
6   }
7   \atom{right}{%
8     1s = { 0; pair} ,
9     2s = { 1; pair} ,
10    2p = {1.5; up, down }
11  }
12 \end{M0diagram}

```

With the command `\molecule` (section 3.2) the reason for the shift becomes clear.

Any of the arguments for the AO can be left empty or be omitted.

```

1 Without argument: default height, full:
2 \begin{M0diagram}
3   \atom{left}{1s, 2s, 2p}
4 \end{M0diagram}

```

Without argument: default height, full:

```

1 empty argument: default height, empty:
2 \begin{M0diagram}
3   \atom{left}{1s=, 2s=, 2p=}
4 \end{M0diagram}

```

empty argument: default height, empty:

using some values:

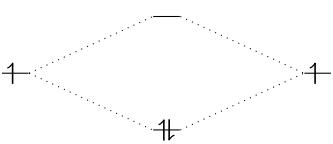

```
1 using some values:\\
2 \begin{M0diagram}
3   \atom{left}{1s, 2s=1, 2p={; ,up} }
4 \end{M0diagram}
```

### 3.2 The `\molecule` Command

- `\molecule[<name>]{<MO-spec>}`  
[<name>] caption of the molecule;  
{<MO-spec>} specifications of the molecular orbitals (MOs);

An example first:

```
1 \begin{M0diagram}
2   \atom{left} { 1s = { 0; up } }
3   \atom{right}{ 1s = { 0; up } }
4   \molecule { 1sMO = {.75; pair } }
5 \end{M0diagram}
```

The command `\molecule` connects the AOs with the bonding and anti-bonding MOs. `\molecule` can only be used *after* one has set *both* atoms since the orbitals that are to be connected must be known.

The argument {<MO-spec>} accepts a comma separated list of key/value pairs:

- ▶  $1sMO$  = <energy gain>/<energy loss>; <s el-spec>, <s\* el-spec> → connects the AOs specified by  $1s$ .
- ▶  $2sMO$  = <energy gain>/<energy loss>; <s el-spec>, <s\* el-spec> → connects the AOs specified by  $2s$ .
- ▶  $2pMO$  = <s energy gain>/<s energy loss>, <p energy gain>/<p energy loss>; <s el-spec>, <py el-spec>, <pz el-spec>, <py\* el-spec>, <pz\* el-spec>, <s\* el-spec> → connects the AOs specified by  $2p$ .

Obviously the regarding AOs must have been set in order to connect them. This for example won't work:

```

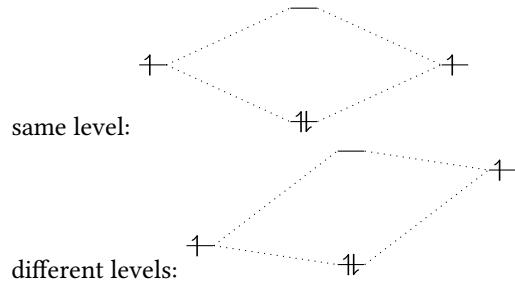

1 \begin{M0diagram}
2 \atom{left} { 1s = 0 }
3 \atom{right}{ 1s = 0 }
4 \molecule { 2sMO = .75 }
5 \end{M0diagram}
```

The value used in <energy gain> determines how many cm the bonding MO lies below the lower AO or how many cm the anti-bonding MO lies above the higher AO.

```

1 same level:
2 \begin{M0diagram}
3 \atom{left} { 1s = { 0; up } }
4 \atom{right}{ 1s = { 0; up } }
5 \molecule { 1sMO = {.75; pair } }
6 \end{M0diagram}

7
8 different levels:
9 \begin{M0diagram}
10 \atom{left} { 1s = { 0; up } }
11 \atom{right}{ 1s = { 1; up } }
12 \molecule { 1sMO = {.25; pair } }
13 \end{M0diagram}
```

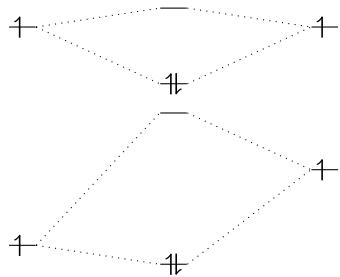

If you specify <energy loss> you can create non-symmetrical splittings. Then, the first value (<energy gain>) is used for the bonding MO and the second value (<energy loss>) is used for the anti-bonding MO.

```

1 \begin{MOdiagram}
2   \atom{left} { 1s = { 0; up } }
3   \atom{right}{ 1s = { 0; up } }
4   \molecule { 1sMO = {.75/.25; pair } }
5 \end{MOdiagram}
6
7 \begin{MOdiagram}
8   \atom{left} { 1s = { 0; up } }
9   \atom{right}{ 1s = { 1; up } }
10  \molecule { 1sMO = {.25/.75; pair } }
11 \end{MOdiagram}

```

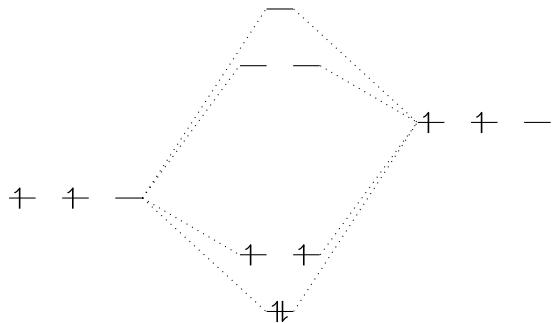

Please be aware, that you have to specify *two* such values or pairs with **2pMO**: the splitting of the  $\sigma$  orbitals and the splitting of the  $\pi$  orbitals.

```

1 \begin{MOdiagram}
2   \atom{left} { 2p = { 0; up, up } }
3   \atom{right}{ 2p = { 1; up, up } }
4   \molecule { 2pMO = { 1.5, .75; pair, up, up } }
5 \end{MOdiagram}

```

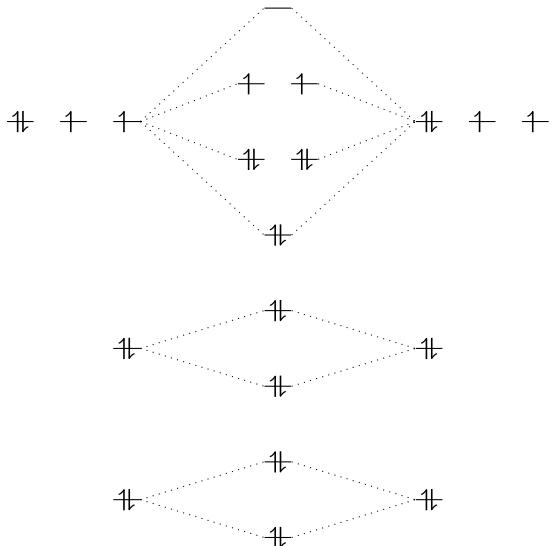

The complete MO diagram for triplet dioxygen now could look something like that:

```

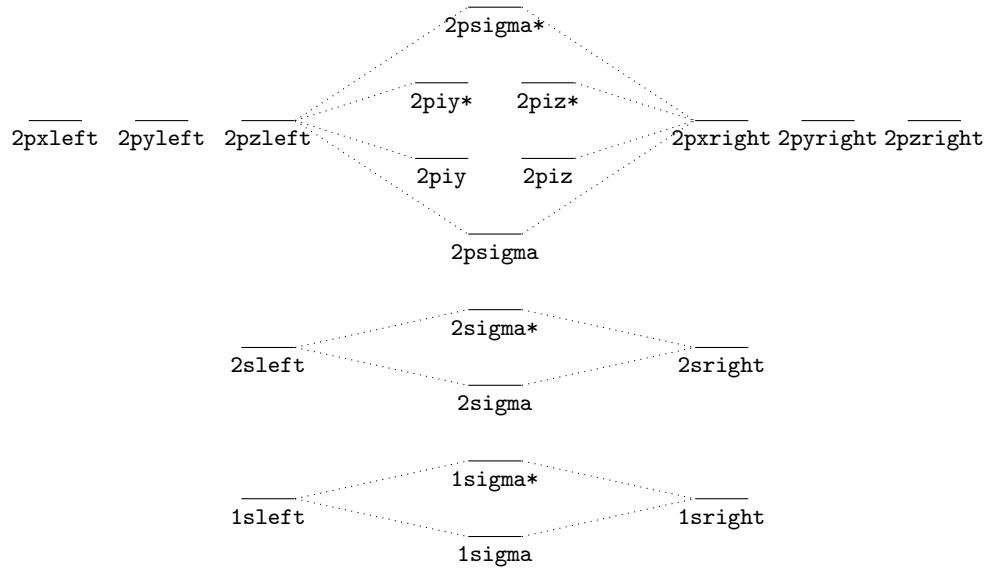

1 \begin{M0diagram}
2   \atom{left}[
3     1s, 2s, 2p = {;pair,up,up}
4   ]
5   \atom{right}[
6     1s, 2s, 2p = {;pair,up,up}
7   ]
8   \molecule{
9     1sMO, 2sMO, 2pMO = {;pair,pair,pair,up,up}
10  }
11 \end{M0diagram}

```

### 3.3 The Naming Scheme

Since one wants to be able to put labels to the orbitals and since they are nodes in a `tikzpicture`, the internal naming scheme is important. It closely follows the function:

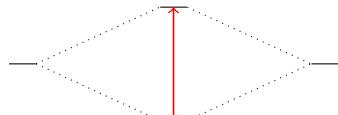

With these names it is possible to reference the orbitals with the known *TikZ* commands:

```

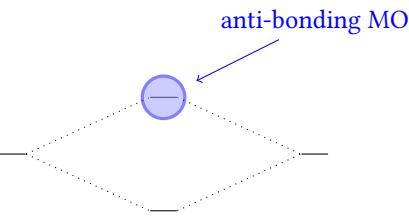

1 \begin{M0diagram}
2   \atom{left}{ 1s = 0 }
3   \atom{right}{ 1s = 0 }
4   \molecule{ 1sMO = .75 }
5   \draw[<->,red,semithick] (1sigma.center) -- (1sigma*.center) ;
6   \draw[red] (1sigma*) ++ (2cm,.5cm) node {splitting} ;
7 \end{M0diagram}
```

splitting

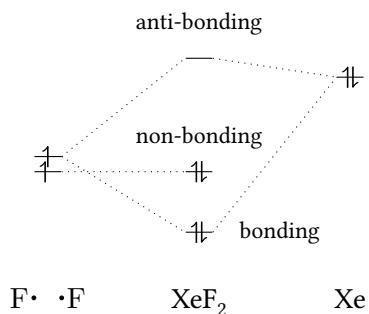

```

1 \begin{M0diagram}
2   \atom{left}{ 1s = 0 }
3   \atom{right}{ 1s = 0 }
4   \molecule{ 1sMO = .75 }
5   \draw[draw=blue,very thick,fill=blue!40,opacity=.5] (1sigma*) circle
6     (8pt);
7   \draw[<-,shorten <=8pt,shorten >=15pt,blue] (1sigma*) --+(2,1) node
      {anti-bonding MO};
\end{M0diagram}
```

### 3.4 Placing AOs and MOs Arbitrarily

The standard orbitals are not always sufficient in order to draw a correct MO diagram. For example in the MO diagram of  $\text{XeF}_2$  one would need the part that illustrates the interaction between the bonding and anti-bonding combination of two p orbitals of Flourine with one p orbital of Xenon:

To create diagrams like this there is the following command, which draws a single AO:

- ▶ **\AO** [<name>] (<xshift>) {<type>} [<key = val>] {<energy>; <el-spec>}
- [<name>] (optional) name of the node; if not specified, AO# is used where # is a consecutive number.
- [<xshift>] vertical position of the orbitals, a TeX dimension.
- {<type>} s or p.
- [<key = val>] key/value pairs with which the AO can be customized, see section 4.3.
- {<AO-spec>} specification of the AO.

Depending on the <type> one s or three p orbitals are drawn.

```

1  \begin{M0diagram}          + + +
2  \AO{s}{0;}                |
3  \AO(-20pt){p}{1;pair,up,down} |
4  \end{M0diagram}           —

```

If one wants to place such an AO at the position of an atom, one has to know their <xshift>. They have predefined values (also see section 3.5):

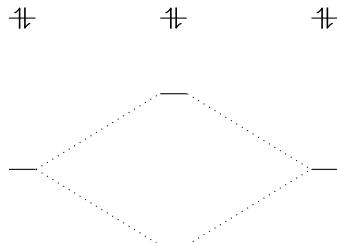

- atom left: 1 cm

- molecule: 3 cm
- atom right: 5 cm

```

1 \begin{M0diagram}
2   \atom{left} {1s=0}
3   \atom{right}{1s=0}
4   \molecule {1sM0=1}
5   \AO(1cm){s}{2}
6   \AO(3cm){s}{2}
7   \AO(5cm){s}{2}
8 \end{M0diagram}

```

Within the p orbitals there is an additional shift by 20 pt per orbital. This is equivalent to a double shift by the length A0-width (see section 4.1.3):

```

1 \begin{M0diagram}
2   \atom{left} {2p=0}
3   \atom{right}{2p=0}
4   % above the left atom:
5   \AO(1cm)    {s}{.5}
6   \AO(1cm-20pt){s}{1;up}
7   \AO(1cm-40pt){s}{1.5;down}
8   % above the right atom:
9   \AO(5cm)    {s}{.5}
10  \AO(5cm+20pt){s}{1;up}
11  \AO(5cm+40pt){s}{1.5;down}
12 \end{M0diagram}

```

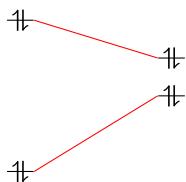

The AOs created with \AO also can be connected. For this you can use the *TikZ* command \draw, of course. You can use the predefined node names...

```

1 \begin{M0diagram}
2   \AO{s}{0} \AO(2cm){s}{1}
3   \AO{s}{2} \AO(2cm){s}{1.5}
4   \draw[red] (A01.0) -- (A02.180) (A03.0) -- (A04.180);
5 \end{M0diagram}

```

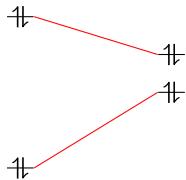

... or use own node names

```

1 \begin{M0diagram}
2   \AO[a]{s}{0} \AO[b]{s}{1}
3   \AO[c]{s}{2} \AO[d]{s}{1.5}
4   \draw[red] (a.0) -- (b.180) (c.0) -- (d.180);
5 \end{M0diagram}

```

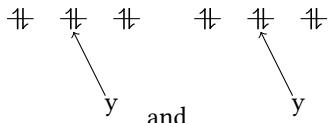

The predefined names are A01, A02 etc. for the type s and A01x, A01y, A01z, A02x etc. for the type p. Nodes of the type p get an x, y or z if you specify your own name, too.

```

1 \begin{M0diagram}
2   \AO[p]{0}
3   \draw[<-,shorten >=5pt] (A01y.-90) -- ++ (.5,-1) node {y};
4 \end{M0diagram}
and
6 \begin{M0diagram}
7   \AO[A]{p}{0}
8   \draw[<-,shorten >=5pt] (Ay.-90) -- ++ (.5,-1) node {y};
9 \end{M0diagram}

```

However, if you want the lines to be drawn in the same style as the ones created by `\molecule`,<sup>6</sup> you should use the command `\connect`.

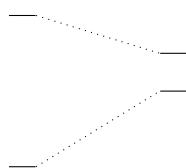

► `\connect{<AO-connect>}`  
`{<AO-connect>}` comma separated list of node name pairs connected with &.

This command expects a comma separated list of node name pairs that are to be connected. The names have to be connected with a &:

```

1 \begin{M0diagram}
2   \AO[s]{0;} \AO(2cm){s}{1;}
3   \AO[s]{2;} \AO(2cm){s}{1.5;}
4   \connect{ A01 & A02, A03 & A04 }
5 \end{M0diagram}

```

---

<sup>6</sup> which can be customized, see page 20

Some things still need to be said: `\connect` adds the anchor `east` to the first name and the anchor `west` to the second one. This means a connection only makes sense from the left to the right. However, you can add own anchors using the usual TikZ way:

```

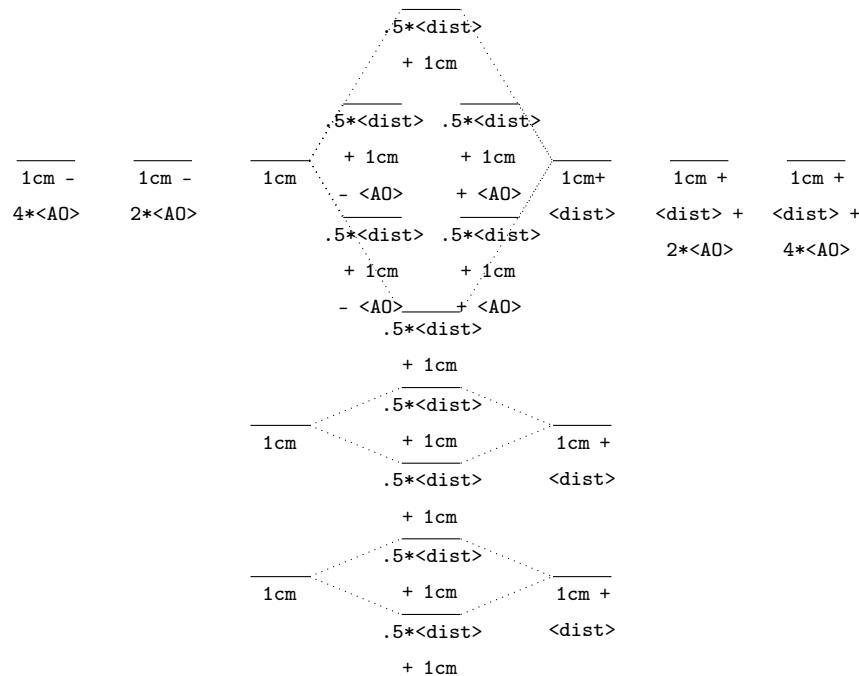

1 \begin{tikzpicture}
2   \draw (0,0) node (a) {a} ++ (1,0) node (b) {b}
3     ++ (0,1) node (c) {c} ++ (-1,0) node (d) {d} ;
4   \connect{ a.90 & d.-90, c.180 & d.0 }
5 \end{tikzpicture}

```

d ..... c  
.....  
a b

### 3.5 The Positioning Scheme

The figure below shows the values of the  $x$  coordinates of the orbitals depending on the values of `<distance>` (`<dist>`) and `<AO-width>` (`<AO>`). In sections 4.1.2 and 4.1.3 these lengths and how they can be changed are discussed.

### 3.6 Default Values

If you leave the arguments (or better: values) for the specification of the AO or MO empty or omit them, default values are used. The table below shows you, which ones.

AO/MO	omitted	empty
syntax:	1s	1s=
1s	{0;pair}	{0;}
2s	{2;pair}	{2;}
2p	{5;pair,pair,pair}	{5;,,}
1sMO	{.5;pair,pair}	{.5;,}
2sMO	{.5;pair,pair}	{.5;,}
2pMO	{1.5,.5;pair,pair,pair,pair,pair}	{1.5,.5;,,,,,}

This is similar for the \AO command (page 10); it needs a value for <energy>, though.

<type>	<el-spec>
s	pair
p	pair,pair,pair

Compare these examples:

```

1  \begin{M0diagram}
2    \atom{left}{ 1s={0;pair} }
3    \atom{right}{ 1s }
4  \end{M0diagram}                                ¶
5
6  \hrulefill
7
8  \begin{M0diagram}
9    \atom{left}{ 1s=1 }
10   \atom{right}{ 1s= }
11  \end{M0diagram}                                —

```

## 4 Customization

The options of the section 4.1 can be set global as package option, i.e. with \usepackage[<key = val>]{modiagram}, or via the setup command \M0setup{<key = val>}.

### 4.1 Environment Options

There are some options with which the layout of the MO diagrams can be changed:

- ▶ **style** = <type> → change the style of the orbitals and the connecting lines, section 4.1.1.
- ▶ **distance** = <dim> → distance between left and right atom, section 4.1.2.
- ▶ **AO-width** = <dim> → change the width of orbitals, section 4.1.3.
- ▶ **el-sep** = <num> → distance between the electron pair arrows, section 4.1.4.
- ▶ **up-el-pos** = <num> → position of the spin-up arrow, section 4.1.4.

- ▶ `down-el-pos` = <num> → position of the spin-down arrow, section 4.1.4.
- ▶ `lines` = <tikz> → change the *TikZ* style of the connecting lines, section 4.1.5.
- ▶ `names` = <bool> → add captions to the atoms and the molecule, section 4.1.6.
- ▶ `names-style` = <tikz> → change the *TikZ* style of the captions, section 4.1.7.
- ▶ `names-style-add` = <tikz> → change the *TikZ* style of the captions, section 4.1.7.
- ▶ `labels` = <bool> → add default labels to the orbitals, section 4.1.8.
- ▶ `labels-fs` = <cs> → change the font size of the labels, section 4.1.9.
- ▶ `labels-style` = <tikz> → change the *TikZ* style of the labels, section 4.1.10.

They all are discussed in the following sections. If they're used as options for the environment, they're set locally and only change that environment.

```

1  \begin{MOdiagram}[<key = value>]
2  ...
3  \end{MOdiagram}
```

#### 4.1.1 Option `style`

There are five different styles which can be chosen.

- `style` = `plain`
- `style` = `square`
- `style` = `circle`
- `style` = `round`
- `style` = `fancy`

Let's take the MO diagram of H<sub>2</sub> to illustrate the different styles:

```

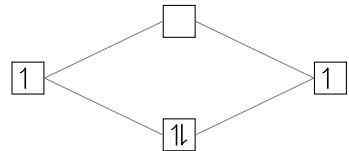

1  % use package 'chemmacros'
2  \begin{MOdiagram}[style=plain] % default
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{MOdiagram}
```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[style=square]
3 \atom[H]{left} { 1s = {;up} }
4 \atom[H]{right}{ 1s = {;up} }
5 \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

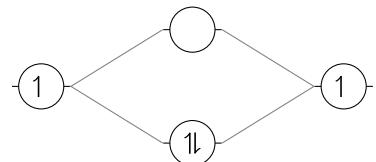

```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[style=circle]
3 \atom[H]{left} { 1s = {;up} }
4 \atom[H]{right}{ 1s = {;up} }
5 \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

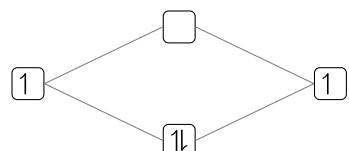

```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[style=round]
3 \atom[H]{left} { 1s = {;up} }
4 \atom[H]{right}{ 1s = {;up} }
5 \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

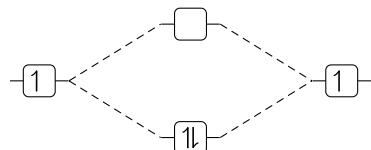

```

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[style=fancy]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

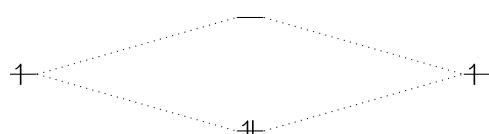

#### 4.1.2 Option *distance*

Depending on labels and captions the 4cm by which the right and left atom are separated can be too small. With *distance* = <dim> the length can be adjusted. This will change the position of the right atom to 1cm + <dim> and the position of the molecule is changed to 0.5\*(1cm + <dim>), also see page 10 and section 3.5.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[distance=6cm]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

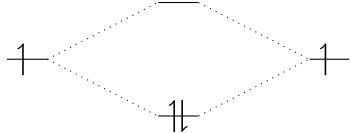

#### 4.1.3 Option *AO-width*

The length *AO-width* sets the length of the horizontal line in a orbital displayed with the plain style. It's default value is 10 pt.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[AO-width=15pt]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

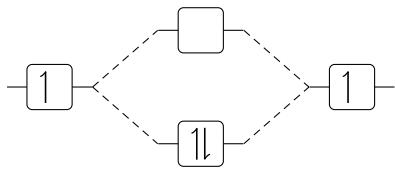

```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[style=fancy,A0-width=15pt]
3   \atom[H]{left} { 1s = {;up} }
4   \atom[H]{right}{ 1s = {;up} }
5   \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

```

By changing the value of `A0-width` the positions of the p and the  $\pi$  orbitals also change, see section 3.5.

#### 4.1.4 Optionen `el-sep`, `up-el-pos` und `down-el-pos`

These three options change the horizontal positions of the arrows representing the electrons in an AO/MO. The option `el-sep` = <num> needs a value between 0 and 1. 0 means *no* distance between the arrows and 1 *full* distance (with respect to the length `A0-width`, see section 4.1.3).

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[el-sep=.2] % default
3   \atom[H]{left} { 1s = {;up} }
4   \atom[H]{right}{ 1s = {;up} }
5   \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

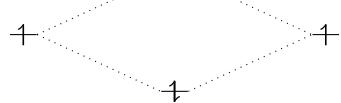

```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[el-sep=0]
3   \atom[H]{left} { 1s = {;up} }
4   \atom[H]{right}{ 1s = {;up} }
5   \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

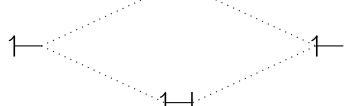

```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[el-sep=1]
3   \atom[H]{left}{ 1s = {;up} }
4   \atom[H]{right}{ 1s = {;up} }
5   \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

```

The options `up-el-pos = <num>` and `down-el-pos = <num>` can be used alternatively to place the spin-up and spin-down electron, respectively. Again they need values between 0 and 1. This time 0 means *on the left* and 1 means *on the right*.

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[up-el-pos=.4,down-el-pos=.6] % default
3   \atom[H]{left}{ 1s = {;up} }
4   \atom[H]{right}{ 1s = {;up} }
5   \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

```

```

1 % use package 'chemmacros'
2 \begin{MOdiagram}[up-el-pos=.333,down-el-pos=.667]
3   \atom[H]{left}{ 1s = {;up} }
4   \atom[H]{right}{ 1s = {;up} }
5   \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6 \end{MOdiagram}

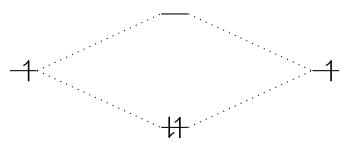

```

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[up-el-pos=.7,down-el-pos=.3]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

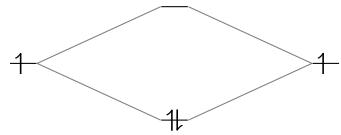

#### 4.1.5 Option `lines`

The option `lines` can be used to modify the `TikZ` style of the connecting lines:

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[lines={gray,thin}]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

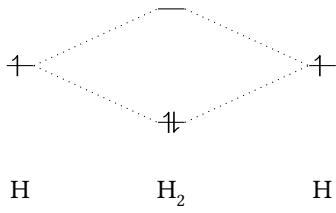

#### 4.1.6 Option `names`

If you use the option `names` the atoms and the molecule get captions provided you have used the optional `<name>` argument of `\atom` and/or `\molecule`.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[names]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

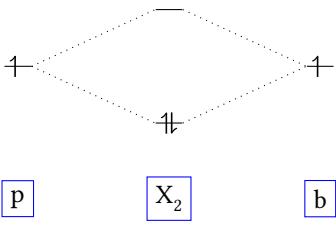

#### 4.1.7 Options `names-style` and `names-style-add`

These options enable to customize the style of the captions of the atoms and of the molecule. By default this setting is used: `names-style = {anchor=base}`.<sup>7</sup>

```

1 % use package 'chemmacros'
2 \begin{M0diagram}[names,names-style={draw=blue}]
3   \atom[p]{left} { 1s = {;up} }
4   \atom[b]{right}{ 1s = {;up} }
5   \molecule[\ch{X2}]{ 1sMO = {.75;pair} }
6 \end{M0diagram}

```

With this the default setting is overwritten. As you can see it destroys the vertical alignment of the nodes. In order to avoid that you can for example specify `text height` and `text depth` yourself ...

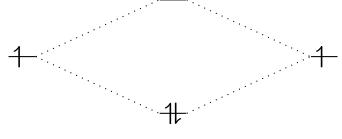

```

1 % use package 'chemmacros'
2 \begin{M0diagram}[names,names-style={text height=1.5ex, text depth
3   =.25ex, draw=blue}]
4   \atom[p]{left} { 1s = {;up} }
5   \atom[b]{right}{ 1s = {;up} }
6   \molecule[\ch{X2}]{ 1sMO = {.75;pair} }
7 \end{M0diagram}

```

---

<sup>7</sup> Please see “*TikZ and PGF – Manual for Version 2.10*” p. 183 section 16.4.4 (pgfmanual.pdf) for the meaning

..., add the anchor again ...

```

1  % use package 'chemm macros'
2  \begin{M0diagram}[names,names-style={anchor=base, draw=blue}]
3  \atom[p]{left} { 1s = {;up} }
4  \atom[b]{right}{ 1s = {;up} }
5  \molecule[\ch{X2}]{ 1sMO = {.75;pair} }
6  \end{M0diagram}

```

... or use the option `names-style-add`. It doesn't overwrite the current setting but appends the new declaration:

```

1  % use package 'chemm macros'
2  \begin{M0diagram}[names,names-style-add={draw=blue}]
3  \atom[p]{left} { 1s = {;up} }
4  \atom[b]{right}{ 1s = {;up} }
5  \molecule[\ch{X2}]{ 1sMO = {.75;pair} }
6  \end{M0diagram}

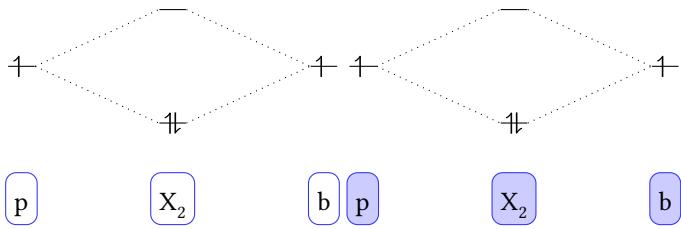

```

```

1  % use package 'chemmacros'
2  \MOsetup{names,names-style={text height=2.5ex,text depth=.5ex,draw=
3    blue!80,rounded corners}}
4  \begin{MOdiagram}
5    \atom[p]{left}{ 1s = {;up} }
6    \atom[b]{right}{ 1s = {;up} }
7    \molecule[\ch{X2}]{ 1sMO = {.75;pair} }
8  \end{MOdiagram}
9  \begin{MOdiagram}[names-style-add={fill=blue!20}]
10   \atom[p]{left}{ 1s = {;up} }
11   \atom[b]{right}{ 1s = {;up} }
12   \molecule[\ch{X2}]{ 1sMO = {.75;pair} }
\end{MOdiagram}

```

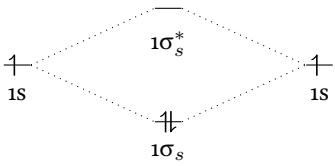

#### 4.1.8 Option `labels`

If you use the option `labels` predefined labels are written below the orbitals. These labels can be changed, see section 4.2.1.

```

1  % use package 'chemmacros'
2  \begin{MOdiagram}[labels]
3    \atom[H]{left}{ 1s = {;up} }
4    \atom[H]{right}{ 1s = {;up} }
5    \molecule[\ch{H2}]{ 1sMO = {.75;pair} }
6  \end{MOdiagram}

```

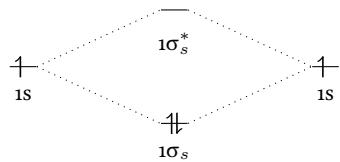

#### 4.1.9 Option `labels-fs`

Labels are set with the font size `\small`. If you want to change that you can use the option `labels-fs`.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[labels,labels-fs=\footnotesize]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

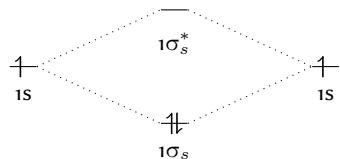

This also allows you to change the font style or font shape of the labels.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[labels,labels-fs=\sffamily\footnotesize]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

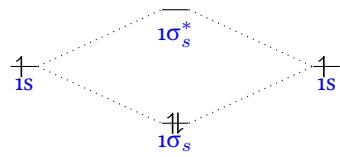

#### 4.1.10 Option `labels-style`

The option `labels-style` changes the *TikZ* style of the nodes within which the labels are written.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[labels,labels-style={blue,yshift=4pt}]
3  \atom[H]{left}{1s = {;up}}
4  \atom[H]{right}{1s = {;up}}
5  \molecule[\ch{H2}]{1sMO = {.75;pair}}
6  \end{M0diagram}

```

## 4.2 \atom and \molecule Specific Customizations

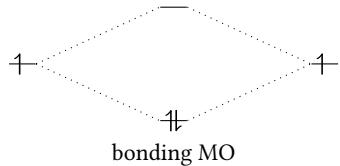

### 4.2.1 The `label` Key

If you don't want to use the predefined labels, change single labels or use only one or two labels, you can use the key `label`. This key is used in the `\atom` and `\molecule` commands in the `<AO-spec>` or `<MO-spec>` argument, respectively. The key awaits a comma separated key/value list. The names mentioned in section 3.3 are used as keys to specify the AO that you want to label.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}[labels-fs=\footnotesize]
3  \atom[H]{left} { 1s = {;up} }
4  \atom[H]{right}{ 1s = {;up} }
5  \molecule[\ch{H2}]{ 
6    1sMO = {.75;pair},
7    label = { 1sigma = {bonding MO} }
8  }
9  \end{M0diagram}

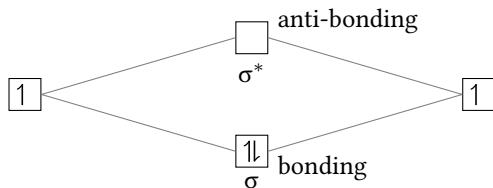

```

```

1  \begin{M0diagram}[style=square,distance=6cm]
2  \atom{left} { 1s = {;up} }
3  \atom{right}{ 1s = {;up} }
4  \molecule{ 
5    1sMO = {.75;pair} ,
6    label = {
7      1sigma = \text{\textsigma},
8      1sigma* = \text{\textsigma}^*
9    }
10  }
11  \node[right] at (1sigma.-45) {bonding};
12  \node[right] at (1sigma*.45) {anti-bonding};
13  \end{M0diagram}

```

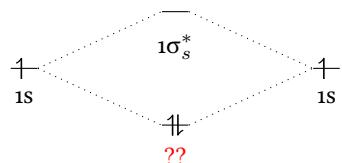

If the key is used together with the `labels` option (page 23) single labels are overwritten:

```

1  % use package 'chemm macros'
2  \begin{M0diagram}[labels]
3  \atom[H]{left}{ 1s = {;up} }
4  \atom[H]{right}{ 1s = {;up} }
5  \molecule[\ch{H2}]{}
6    1sMO = {.75;pair},
7    label = { 1sigma = \textcolor{red}{??} }
8  }
9  \end{M0diagram}

```

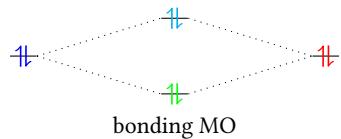

#### 4.2.2 The color Key

Analogous to the `label` key the `color` key can be used to display coloured electrons:

```

1  % use package 'chemm macros'
2  \begin{M0diagram}[labels-fs=\footnotesize]
3  \atom[H]{left}{ 1s, color = { 1sleft = blue } }
4  }
5  \atom[H]{right}{ 1s, color = { 1sright = red } }
6  }
7  \molecule[\ch{H2}]{}
8    1sMO,
9    label = { 1sigma = {bonding MO} },
10   color = { 1sigma = green, 1sigma* = cyan }
11 }
12 \end{M0diagram}

```

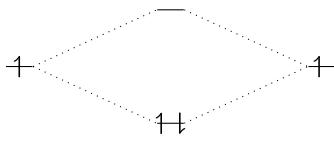

#### 4.2.3 The up-el-pos and down-el-pos keys

The keys `up-el-pos` and `down-el-pos` allow it to shift the arrows representing the electrons in a single AO or MO individually. You need to use values between 0 and 1, also see section 4.1.4.

```

1  % use package 'chemmacros'
2  \begin{M0diagram}
3  \atom[H]{left}{%
4    1s      = {;up},
5    up-el-pos = { 1sleft=.5 }
6  }
7  \atom[H]{right}{ 1s = {;up} }
8  \molecule[\ch{H2}]{%
9    1sMO      = {.75;pair} ,
10   up-el-pos = { 1sigma=.15 } ,
11   down-el-pos = { 1sigma=.85 }
12 }
13 \end{M0diagram}

```

## 4.3 \AO Specific Customizations

These keys enable to customize orbitals created with \AO.

### 4.3.1 The `label` Key

The key `label[x/y/z]` allows you to put a label to the AO/MO. If you use the type p you can specify the orbital you want to label in square brackets:

```

1  \begin{M0diagram}[style=square]
2  \AO{s}[label={s orbital}]{0}
3  \AO{p}[label[y]=py,label[z]=pz]{1.5}
4  \end{M0diagram}

\begin{array}{ccc}
\boxed{1l} & \boxed{1l} & \boxed{1l} \\
py & & pz
\end{array}

```

s orbital

### 4.3.2 The `color` Key

Analogous to the `label` key there is the key `color[x/y/z]` which enables you to choose a color for the electrons. If you use the type p you can specify the orbital in square brackets:

```

1  \begin{M0diagram}[style=square]
2  \AO{s}[color=red]{0}
3  \AO{p}[color[y]=green,color[z]=cyan]{1.5}
4  \end{M0diagram}

```

### 4.3.3 The up-el-pos and down-el-pos Keys

Then there are the keys `up-el-pos[x/y/z]` and `down-el-pos[x/y/z]` with which the electrons can be shifted horizontally. You can use values between 0 and 1, also see section 4.1.4. If you use the type p you can specify the orbital in square brackets:

```
1 \begin{M0diagram}[style=square]
2   \AO{s}[up-el-pos=.15]{0}
3   \AO{p}[up-el-pos[y]=.15,down-el-pos[z]=.15]{1.5}
4 \end{M0diagram}
```

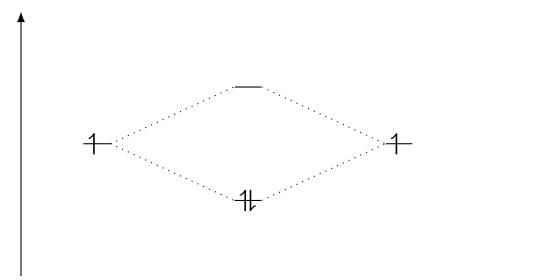

## 4.4 Energy Axis

Last but not least one might want to add an energy axis to the diagram. For this there is the command `\EnergyAxis`.

- ▶ `\EnergyAxis[<key = val>]`  
[`<key = val>`] key/value pairs to modify the axis.

```
1 \begin{M0diagram}
2   \atom{left}{ 1s = {;up} }
3   \atom{right}{ 1s = {;up} }
4   \molecule{ 1sMO = {.75;pair} }
5   \EnergyAxis
6 \end{M0diagram}
```

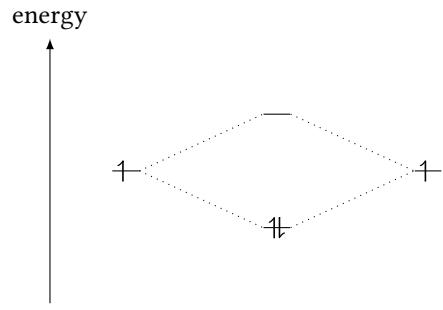

For the time being there are two keys to modify the axis.

- ▶ `title` = `<title>` → axis label (default: `energy`).
- ▶ `head` = `<tikz-arrow-head>` → arrow head; you can use the arrow heads specified in the `TikZ` library `arrows` (pgfmanual v2.10 pages 256ff.) (default: `>`).

```

1 \begin{M0diagram}
2 \atom{left}{ 1s = {;up} }
3 \atom{right}{ 1s = {;up} }
4 \molecule{ 1sMO = {.75;pair} }
5 \EnergyAxis[title]
6 \end{M0diagram}

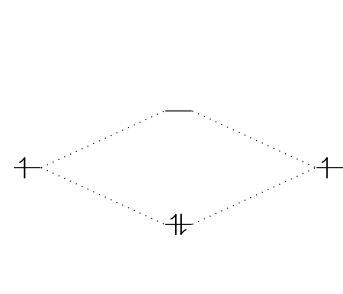

```

```

1 \begin{M0diagram}
2 \atom{left}{ 1s = {;up} }
3 \atom{right}{ 1s = {;up} }
4 \molecule{ 1sMO = {.75;pair} }
5 \EnergyAxis[title=E,head=stealth]
6 \end{M0diagram}

```

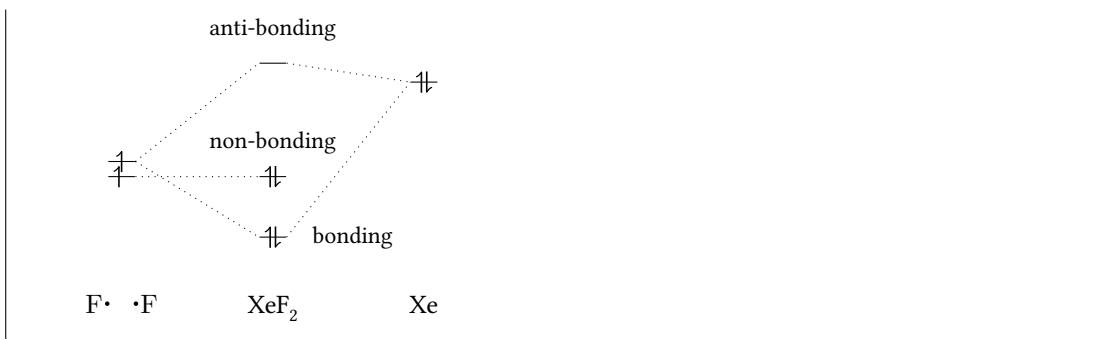

## 5 Examples

The example from the beginning of section 3.4.

```

1 % use packages 'chemmacros' and 'chemfig'
2 \begin{M0diagram}[names]
3 \atom[\lewis{0.,F}\hspace*{5mm}\lewis{4.,F}]{left}{1s=.2;up,up-el-
4 pos={1sleft=.5}}
5 \atom[Xe]{right}{1s=1.25;pair}
6 \molecule[\ch{XeF2}]{1sMO={1/.25;pair}}
7 \AO(1cm){s}{0;up}
8 \AO(3cm){s}{0;pair}
9 \connect{AO1 & AO2}
10 \node[right,xshift=4mm] at (1sigma) {\footnotesize bonding};
11 \node[above] at (AO2.90) {\footnotesize non-bonding};
12 \node[above] at (1sigma*.90) {\footnotesize anti-bonding};
13 \end{M0diagram}

```

```

1  % use packages 'chemmacros' (and 'textgreek' loaded by 'modiagram')
2  \begin{figure}
3  \centering
4  \begin{MOdiagram}[style=square,labels,names,A0-width=8pt,
5    labels-fs=\footnotesize]
6    \atom[\ch{O_a}]{left}{1s, 2s, 2p = {;pair,up,up}}
7  }
8    \atom[\ch{O_b}]{right}{1s, 2s, 2p = {;pair,up,up}}
9  }
10   \molecule[\ch{O2}]{}
11     1sMO, 2sMO, 2pMO = {;pair,pair,pair,up,up},
12     color = { 2piy*=red, 2piz*=red }
13   }
14   \EnergyAxis
15 \end{MOdiagram}
16 \caption{MO diagram of \ch{^3 "textSigma-"} O2.}
17 \end{figure}
18

```

```

1  % use package 'chemfig'
2  \begin{figure}
3  \centering\MOsetup{style = fancy, distance = 7cm, A0-width
4    = 15pt, labels}
5  \begin{MOdiagram}
6    \atom[N]{left}{2p = {0;up,up,up}}
7  }
8    \atom[O]{right}{2p = {2;pair,up,up}}
9  }
10   \molecule[NO]{}
11     2pMO = {1.8,.4;pair,pair,pair,up},
12     color = { 2piy*=red }
13   }
14

```
