## Generating HTML Quickly with T<sub>E</sub>X\*

Uwe Lück<sup>†</sup>

February 10, 2011

### Abstract

blog.sty provides T<sub>E</sub>X macros for generating web pages, based on processing text files using the `fifinddo` package. Some L<sup>A</sup>T<sub>E</sub>X commands are redefined to access their HTML equivalents, other new macro names “quote” the names of HTML elements. The package has evolved in several little steps each aiming at getting pretty-looking “hypertext” **notes** with little effort, where “little effort” also has meant avoiding studying documentation of similar packages already existing. [TODO: list them!] The package “misuses” T<sub>E</sub>X’s macro language for generating HTML code and entirely ignores T<sub>E</sub>X’s typesetting capabilities.

## 1 Installing and Usage

The file `blog.sty` is provided ready, **installation** only requires putting it somewhere where T<sub>E</sub>X finds it (which may need updating the filename data base).<sup>1</sup>

**User commands** are described near their implementation below.

However, we must present an **outline** of the procedure for generating HTML files:

At least one **driver** file and one **source** file are needed.

The **driver** file's name is stored in `\jobname`. It loads `blog.sty` by

```
\RequirePackage{blog}
```

and uses file handling commands from `blog.sty` and `fifinddo` (cf. `mdoccheat.pdf` from the `nicetext` bundle). It chooses **source** files and the name(s) for the resulting HTML file(s). It may also need to load local settings, such as for the language (`lang-de.fdf`, `lang-en.fdf`), and settings for converting the editor's text encoding into the encoding that the head of the resulting HTML file advertises (`atari.fdf`).

The driver file can run a terminal dialogue in order to choose source and target files and settings. So far, I rather have programmed a dialogue just for converting UTF-8 into an encoding that my Atari editor xEDIT can deal with [TODO: present in `nicetext`].

The **source** file(s) should contain user commands defined below to generate the necessary `<head>` section and the `<body>` tags.

---

<sup>1</sup><http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf>

## 2 Example

My “TeX-generated pages”<sup>2</sup> use a **driver** file `makehtml.tex`. To choose a page to generate, I “uncomment” just one of several lines that set the “current conversion job” from a list. I choose the example of a simple “site map:” `texmap.htm` is generated from **source** file `texmap.tex`.

### 2.1 Driver File `makehtml.tex`

17 %%

```

### 3.2 Processing

We are building on the `fifinddo` package:

```
18  \RequirePackage{fifinddo}
```

`\BlogCopyFile[⟨changes⟩]{⟨src-file⟩}` “copies” the TeX source file `⟨src-file⟩` into the file specified by `\ResultFile`. As in TeX an empty line starts a new paragraph, we “interpret” an empty source line as HTML tag `<p>` for starting a new paragraph. Empty source lines following some first empty source line immediately are ignored (“compression” of empty lines).—However, I am not entirely sure that this won’t have unwanted effects, so it must be required explicitly by `\BlogAutoPars`, or by calling the package with option `[autopars]`. In the latter case, it can be turned off by `\noBlogAutoPars`

```

19  \newif\ifBlogAutoPars
20  \newcommand*{\BlogAutoPars}{\BlogAutoParstrue}
21  \newcommand*{\noBlogAutoPars}{\BlogAutoParsfalse}
22  \DeclareOption{autopars}{\BlogAutoPars}
23  \ProcessOptions
24  \MakeOther\<\MakeOther\>          %% TODO ...
25  \newcommand*{\BlogCopyFile}[2][]{%
26      \ProcessFileWith[\BlogCodes #1]{#2}{%
27          \IfFDinputEmpty
28              {\IfFDpreviousInputEmpty
29                  \relax
30                  {\WriteResult{\ifBlogAutoPars<p>\fi}}{}}%
31          \CopyLine
32      }%
33  }

```

For a while, line endings swallowed inter-word spaces, until I found the setting of `\endlinechar` (`fifinddo`’s default is `-1`) in `\BlogCodes`:

```

34  \newcommand*{\BlogCodes}{%
35      \endlinechar`\~\active \BasicNormalCatCodes}

```

The tilde is active as in Plain TeX too, it is so natural to use it for abbreviating HTML's &nbsp;!

### 3.3 General HTML Matters

The following stuff is required for any web page (or hardly evitable).

#### 3.3.1 General Tagging

`\TagSurr{<el-name>}{<attr>}{<content>}`

(I hoped this way code would be more readable than with `\TagSurround ...`) and

`\SimpleTagSurr{<el-name>}{<content>}`

are used to avoid repeating element names `<el-name>` in definitions of TeX macros that refer to “entire” elements—as opposed to elements whose content often spans lines (as readable HTML code). We will handle the latter kind of elements using L<sup>A</sup>T<sub>E</sub>X’s idea of “environments.” `\TagSurr` also inserts specifications of element **attributes**, [TODO: wiki.sty syntax would be so nice here] while `\SimpleTagSurr` is for elements used without specifying attributes. `\STS` is an abbreviation for `\SimpleTagSurr` that is useful as the `\SimpleTagSurr` function occurs so frequently:

```

36  \newcommand*{\SimpleTagSurr}[2]{<#1>#2</#1>}
37  \newcommand*{\STS}{} \let\STS\SimpleTagSurr %% 2010/05/23
38  \newcommand*{\TagSurr}[3]{<#1 #2>#3</#1>}

```

#### 3.3.2 Attributes

Inspired by the common way to use `@` for referring to element attributes—i.e., `@<attr>` refers to attribute `<attr>`—in HTML/XML documentation, we often use

`\@<attr>{<value>}` to “abbreviate” `<attr>=<value>`

within the starting tag of an HTML element. This does not really make typing easier or improve readability, it rather saves TeX’s memory by using a single token for referring to an attribute. This “abbreviation” is declared by `\declareHTMLAttrib{<attr>}`, even with a check whether `\@<attr>` has been defined before:

```

39  \newcommand*{\declareHTMLAttrib}[1]{%
40      \def\reserved@a{\@#1}%
41      \@ifundefined{\@#1}{%
42          % {\@namedef{\@#1}##1{ #1="#1"};}%
43          {\@namedef{\@#1}##1{#1="#1"};}%
44          \@notdefinable}

```

So after `\declareHTMLattrib{attr}`, `\@{attr}` is a TeX macro expecting one parameter for the specification.

A few frequent attributes are declared this way here. `@href` is most important for that “hyper-text.”

```
45  \declareHTMLattrib{href}
```

... and `@name` (among other uses) is needed for hyper-text anchors:

```
46  \declareHTMLattrib{name} %> 2010/11/06
```

```
47  % \expandafter\show\csname @href\endcsname
```

`@bgcolor` and other attributes following are especially used in formatting tables:

```
48  \declareHTMLattrib{bgcolor}
```

Of course, conflicts may occur, as the form `\@{ASCII-chars}` of macro names is used for internal (La)TeX macros. Indeed, `\@width` that we want to have for the `@width` attribute already “abbreviates” TeX’s “keyword” (TeXbook p. 61) `width` in L<sup>A</sup>T<sub>E</sub>X (for specifying the width of a `\hrule` or `\vrule` from TeX; again just saving TeX tokens rather than for readability).

```
49  \PackageWarning{blog}{Redefining \protect\@width}
```

```
50  \let\@width\relax
```

```
51  \declareHTMLattrib{width}
```

Same with `@height`:

```
52  \PackageWarning{blog}{Redefining \protect\@height}
```

```
53  \let\@height\relax
```

```
54  \declareHTMLattrib{height} %> 2010/07/24
```

We can enumerate the specifications allowed for `@align` ... actually it isn’t used/introduced here ... we just abbreviate (indeed!) entire attribute specifications:

```
55  \newcommand*{\@align@c}{align="center"} %> 2010/08/03
```

```
56  \newcommand*{\@align@l}{align="left"} %> 2010/07/17
```

```
57  \newcommand*{\@align@r}{align="right"}
```

Some other uses of `\declareHTMLattrib` essential for tables:

```
58  \declareHTMLattrib{cellpadding} %> 2010/07/18
```

```
59  \declareHTMLattrib{cellspacing} %> 2010/07/18
```

```
60  \declareHTMLattrib{colspan} %> 2010/07/17
```

```
61  \declareHTMLattrib{frame} %> 2010/07/24
```

**Another problem** with this namespace idea is that *either* this reference to attributes cannot be used in “author” source files for generating HTML—or `@` cannot be used for “private” (internal) macros. Cf. `\ContentAtt` for `<meta>` tags ... well, not so bad, as the main purpose of this namespace is saving tokens *in macros*.

### 3.3.3 HTML's Special Symbols

`\#` is needed for numerical specifications in HTML, especially colors and Unicode symbols, while it plays a different (essential) role in our definitions of `TeX` macros here. We redefine `LATeX`'s `\#` for a kind of “quoting” `#` in macro definitions in order to refer to their HTML meaning.—I **wonder** what I had in mind with the `&` things here. I cannot find any use of `\AmpMark` in my code (including my web pages). There is no real problem with calling special HTML symbols, `&` is simply made `other` already here for macros calling those symbols (below), and in processing source files, it is as well `other` by default. The symbols section, however, redefines `\&` for calling HTML's ampersand symbol.

```
62  {\catcode`&=12 \catcode`\#=12
63   \gdef\AmpMark{&} \gdef\#{\#}}
...
... \CompWordMark etc.?
```

### 3.3.4 Head

`\head` produces the first two tags that an HTML file must start with (we sometimes use `^J` for line breaks in the HTML file to get some readability of the generated code):

```
64  \newcommand*{\head}{<html><head>} %% ^J rm 2010/10/10
\MetaTag{\langle inside \rangle} and \ContentAtt{\langle value \rangle} are internal shortcuts:
65  \newcommand*{\MetaTag}[1]{\space\space<meta #1>}
66  \newcommand*{\ContentAtt}[1]{content="#1"}
\charset{\langle code-page \rangle}
67  \newcommand*{\charset}[1]{%
68   \MetaTag{http-equiv="Content-Type" \ContentAtt{text/html; #1}}}
\description{\langle text \rangle} for web searches (I think):
69  \newcommand*{\description}[1]{%
70   \MetaTag{\@name{description} \ContentAtt{#1}}}
```

... an outright **mistake!** The definition is overridden to get the HTML equivalent to `LATeX`'s `description` environment. `\newcommand` did not warn here because we don't load any `LATeX` class for text-processing macros and code generation.—And so some `\MetaDescr` should be defined—and used finally!

```
\robots{\langle instructions \rangle}:
71  \newcommand*{\robots}[1]{% juergenf: index, follow, noarchive
72   \MetaTag{\@name{robots} \ContentAtt{#1}}}
\stylesheet{\langle media \rangle}{\langle css \rangle} !?
73  \newcommand*{\stylesheet}[2]{%
74   \space\space %> 2010/09/10
75   <link rel="stylesheet" media="#1" type="text/css" \@href{#2.css}>}
```

With `\title{<text>}`, `<text>` heads the browser window:

```
76 \renewcommand*{\title}[1]{\space\space<title>#1</title>}
```

### 3.3.5 Body

`\body` separates the `head` element from the `body` element of the page.

```
77 \newcommand*{\body}{</head><body>}
```

`\topofpage` generates an anchor `top-of-page`:

```
78 \newcommand*{\topofpage}{\hanc{top-of-page}{}}
```

`\finish` finishes the page, closing the `body` and `html` elements.

```
79 \newcommand*{\finish}{</body></html>}
```

## 3.4 Fonts

`\heading{<level>}{<text>}` prints `<text>` with size dependent on `<level>`. The latter may be one out of 1, 2, 3, 4 (I think).

```
80 \newcommand*{\heading}[1]{\SimpleTagSurr{h#1}}
```

... I might use `\section` etc. one day, I made `\heading` when I could not control the sizes of the section titles properly and decided first to experiment with the level numbers.

We “re-use” some L<sup>A</sup>T<sub>E</sub>X commands for specifying font attributes, rather than (re)defining macros `\i`, `\b`, `\tt`, ...

`\textit{<text>}` just expands to `<i><text></i>`

```
81 \renewcommand*{\textit}{\SimpleTagSurr i}
```

etc. for `\textbf`, `\texttt` ...:

```
82 \renewcommand*{\textbf}{\SimpleTagSurr b}
```

```
83 \renewcommand*{\texttt}{\SimpleTagSurr{tt}} %% 2010/06/07
```

`\textcolor` is from L<sup>A</sup>T<sub>E</sub>X’s `color` package that we won’t load for generating HTML, so it is “new” here, it is just natural to use it for colored text (2010/05/15):

```
84 \newcommand*{\textcolor}[1]{\TagSurr{font}{color="#1"}}
```

`\code{<text>}` is different than the former font commands, it is *not* a standard L<sup>A</sup>T<sub>E</sub>X macro. It is similar to `\verb`, which however doesn’t work with a pair of curly braces. The macro name rather is derived from the HTML element name `code`:

```
85 \newcommand*{\code}{\SimpleTagSurr{code}} %% 2010/04/27
```

`\emph{⟨text⟩}` is L<sup>A</sup>T<sub>E</sub>X’s command again, but somewhat abused, expanding to ‘`<em>⟨text⟩</em>`’:

```
86 \renewcommand*\{\emph\} {\SimpleTagSurr{em}}
```

... Note that L<sup>A</sup>T<sub>E</sub>X’s `\emph` feature of switching to up when `\emph` appears in an italic context doesn’t work here ...

`\strong{⟨text⟩}` again just calls an HTML element. It may behave like `\textbf{⟨text⟩}`, or ... I don’t know ...

```
87 \newcommand*\{\strong\} {\SimpleTagSurr{strong}}
```

### 3.5 Environments

We reduce L<sup>A</sup>T<sub>E</sub>X’s `\begin` and `\end` to their most primitive core.

`\begin{⟨command⟩}` just executes the macro `\⟨command⟩`, and

`\end{⟨command⟩}` just executes the macro `\end⟨command⟩`.

They don’t constitute a group with local settings. Indeed, the present (2010/11/07) version of `blog.sty` does not allow any assignments while “copying” the T<sub>E</sub>X source into the `.htm`. There even is no check for proper nesting. `\begin` and `\end` just represent HTML elements (their starting/ending tags) that typically have “long” content. (We might “intercept” `\begin` and `\end` before copying for executing some assignments in a future version.)

```
88 \let\begin\@nameuse
89 \def\end#1{\csname end#1\endcsname}
```

`{center}`—TODO cf. `<center>` 2010/07/18:

```
90 \renewenvironment*\{center\}{<p align="center">}{</p>}
```

... moving `{english}` to `xmlprint.cfg` 2010/05/22 ...

As formerly with “fonts,” we have *two* policies for **choosing macro names**: (i) using an *existing* HTML element name, (ii) using a L<sup>A</sup>T<sub>E</sub>X command name for accessing a somewhat similar HTML element having a *different* name.

`\declareHTMLLelement{⟨el-name⟩}` creates a *new* `⟨el-name⟩` “environment” according to policy (i):

```
91 \newcommand*\{\declareHTMLLelement\}[1]{%
92     \newenvironment*{#1}{<#1>}{</#1>}}
```

`\renderHTMLLelement{⟨ltx-env⟩}{⟨el-name⟩}` *redefines* L<sup>A</sup>T<sub>E</sub>X’s `⟨ltx-env⟩` environment to use HTML’s `⟨el-name⟩` element according to policy (ii):

```
93 \newcommand*\{\renderHTMLLelement\}[2]{%
94     \renewenvironment*{#1}{<#2>}{</#2>}}
```

Applying former auxiliaries:

`\small` is a L<sup>A</sup>T<sub>E</sub>X command from a *class*—that we won’t load, therefore we can create a *new* `{small}` environment using `<small>` according to policy (i):

```
95 \declareHTMLelement{small}
```

The next definitions for `{enumerate}`, `{itemize}`, `{verbatim}` follow policy (ii):

```
96 \renderHTMLelement{enumerate}{ol}
97 \renderHTMLelement{itemize} {ul}
```

With `blog.sty`, `{verbatim}` really doesn't work much like its original L<sup>A</sup>T<sub>E</sub>X variant. T<sub>E</sub>X macros inside still are expanded, and you must care yourself for wanted "quoting":

```
98 \renderHTMLelement{verbatim} {pre} %% 2010/09/10
```

`{quote}` is defined in L<sup>A</sup>T<sub>E</sub>X classes only again. To use it for policy (ii), we give it a dummy definition so `\render...` won't complain:

```
99 \let\quote\empty
100 \renderHTMLelement{quote} {blockquote}
```

For list `\item`s, I tried to get readable HTML code using `\indenti`. This fails with nested lists. The indent could be increased for nested lists if we supported assignments with `\begin` and `\end`.

```
101 \renewcommand*{\item}{\indenti<li>}
```

← 2010/05/23, 2010/06/10 →

```
102 % \renewcommand*{\item}{<li>}
```

L<sup>A</sup>T<sub>E</sub>X's `{description}` environment redefines the label format for the optional argument of `\item`. Again, we cannot do this here (we even cannot use optional arguments, at least not easily). Instead we define a different `\ditem{<term>}` having a *mandatory* argument.

```
103 \renderHTMLelement{description}{dl}
104 \newcommand*{\ditem}[1]{\indenti<dt>\strong{#1}<dd>}
```

## 3.6 Links

### 3.6.1 Basic Link Macros

`\hanc{<id>}{<text>}` makes `<text>` an anchor with HTML label `<id>` (like `hyperref`'s `\hypertarget`):

```
105 \newcommand*{\hanc}[1]{\TagSurr a{\@name{#1}}}
```

`\hancref{<id>}{<url>}{<text>}` makes `<text>` an anchor with HTML label `<id>` and at the same time a link to `<url>`:

```
106 \newcommand*{\hancref}[3]{\TagSurr a{\@name{#1} \@href{#2}}}
```

`\href{<id>}{<text>}` makes `<text>` a link to `<url>`:

```
107 \newcommand*{\href}[1]{\TagSurr a{\@href{#1}}}
```

### 3.6.2 Special cases of Basic Link Macros

`\autanc{<text>}` creates an anchor where `<text>` is the text and the internal label at the same time:

```
108 \newcommand*\autanc[1]{\hanc{\#1}{\#1}} %> 2010/07/04
```

`\ancref{<id>}{<text>}` makes `<text>` a link to an anchor `<id>` on the same web page. This is especially useful for a “table of contents”—a list of links to sections of the page.

```
109 \newcommand*\ancref[1]{\href{\##1}}
```

`\autref{<text>}` makes `<text>` a link to an anchor named `<text>` itself:

```
110 \newcommand*\autref[1]{\ancref{\#1}{\#1}} %> 2010/07/04
```

### 3.6.3 Italic Variants

Some of the link macros get “emphasized” or “italic” variants. Originally I used “emphasized,” later I decided to replace it by “italic,” as I found that I had used italics for another reason than emphasizing. E.g., `<text>` may be ‘bug,’ and I am not referring to some bug, but to the Wikipedia article *Bug*. This has been inspired by some Wikipedia typography convention about referring to titles of books or movies. (The `em` → `it` replacement has not been completed yet.)

```
111 % \newcommand*\emhref[2]{\href{\#1}{\emph{\#2}}}
112 \newcommand*\ithref[2]{\href{\#1}{\textit{\#2}}}
113 \newcommand*\itancref[2]{\ancref{\#1}{\textit{\#2}}} %> 2010/05/30
114 \newcommand*\emancref[2]{\ancref{\#1}{\emph{\#2}}}
```

### 3.6.4 Built Macros for Links to Local Files

Originally, I wanted to refer to my web pages only, using

`\fileref{<filename-base>}`.

I have used extension `.htm` to avoid disturbing my Atari editor `xEDIT` or the the Atari emulator (Hatari). I could switch to `.html` some time using symbolic links. The extension I actually use is stored as macro `\htext` in a more local file (e.g., `.cfg`).—Later I realized that I may want to refer to local files other than web pages, and therefore I introduced a more general `\FileRef{<filename>}`.  
**Only now (v0.2) I realize** it's just the same as `\href!`

```
115 \newcommand*\FileRef[1]{\TagSurr a{\@href{\#1}}}
```

← 2010/09/11 →

```
116 \newcommand*\fileref[1]{\FileRef{\#1\htext}}
117 % \newcommand*\emfileref[2]{\fileref{\#1}{\emph{\#2}}}
118 \newcommand*\itfileref[2]{\fileref{\#1}{\textit{\#2}}}
```

`\fileancref{⟨file⟩}{⟨anchor⟩}` links to anchor `⟨anchor⟩` on web page `⟨file⟩`:

```

119  \newcommand*{\fileancref}[2]{%
120    \TagSurr a{\@href{#1\hbox{\#2}}}
121  % \newcommand*{\emfileancref}[3]{\fileancref{#1}{#2}{\emph{#3}}}

← 2010/05/31 →

122  \newcommand*{\itfileancref}[3]{\fileancref{#1}{#2}{\textit{#3}}}
```

### 3.6.5 Built Macros for Links to Remote Files

`blog.sty` currently (even 2011/01/24) implements my style *not* to open a new browser window or tab for *local* files but to open a new one for *remote* files, i.e., when a file is addressed by a full URL. For the latter case, there is

`\httpref{⟨host-path[#frag]⟩}{⟨text⟩}`

making `⟨text⟩` a link to `http://⟨host-path[#frag]⟩`:

```

123  % \newcommand*{\httpref}[1]{\href{http://#1}}
124  \newcommand*{\httpref}[1]{%                                %% 2010/04/11
125    \TagSurr a{\@href{http://#1" target="_blank}}}
```

With v0.4, macros based on `\httpref` are moved to `texlinks.sty`:

```
126  \RequirePackage[blog]{texlinks}[2011/02/10]
```

Former `\urlref` appears as `\urlhttpref` there ...

```
127  \newcommand \urlref {} \let\urlref\urlhttpref
```

... and `\ctanref` has been replaced by `\tugctanref`. Let's go on playing with the difference ...

```
128  \newcommand*{\ctanref}[1]{\httpref{ctan.org/tex-archive/#1}}
```

`texlinks` sometimes uses a “permanent alias” `\NormalHTTPPref` of `\httpref`:

```
129  \@ifdefinable \NormalHTTPPref {\let\NormalHTTPPref\httpref}
```

## 3.7 Symbols

`&` is made `other` for using it to call HTML’s “character entities”.

```
130  \@makeother\&
```

Again we have the two policies about choosing macro names and respectively two new definition commands. `\declareHTMLsymbol{⟨name⟩}` defines a macro `\⟨name⟩` expanding to `&⟨name⟩;`. Checking for prior definedness hasn't been implemented yet. (TODO)

```
131  \newcommand*{\declareHTMLsymbol}[1]{\@namedef{#1}{\&#1;}}
```

`\renderHTMLsymbol{<macro>}{<name>}` redefines macro `<macro>` to expand to `&<name>;`:

```
132 \newcommand*{\renderHTMLsymbol}[2]{\renewcommand*{[#1]}{\#2}}
```

These auxilaries applied: `\ccedil` (TODO re-order) ...

```
133 \declareHTMLsymbol{ccedil} %% 2010/08/17
```

Arrows: `\gets`, `\to`, `\uparrow`, `\downarrow` ...

```
134 \renderHTMLsymbol{\gets}{\larr}
```

```
135 \renderHTMLsymbol{\to}{\rarr}
```

```
136 \renderHTMLsymbol{\uparrow}{\uarr} %% 2010/09/15
```

```
137 \renderHTMLsymbol{\downarrow}{\darr} %% 2010/09/15
```

> and <: `\gt`, `\lt` ...

```
138 \declareHTMLsymbol{gt} %% greater than 2010/06/13
```

```
139 \declareHTMLsymbol{lt} %% less than 2010/06/13
```

Redefinitions of `\&` and `\%` (well, `\PercentChar` is fifinddos version of L<sup>A</sup>T<sub>E</sub>X's `\@percentchar`):

```
140 \renderHTMLsymbol{\&}{\amp}
```

```
141 \let\%=\PercentChar %% 2010/07/01
```

Horizontal ellipsis: `\dots` ...

```
142 \renderHTMLsymbol{\dots}{\hellip}
```

The tilde `\~` is used for its wonderful purpose, by analogy to T<sub>E</sub>X:

```
143 \renderHTMLsymbol{\~}{\nbsp}
```

But now we need a replacement `\tilde` for URLs involving home directories of institution members:

```
144 {\@makeother\` \gdef\tilde{\~}}
```

The ligatures -- and --- for en dash and em dash don't work in our expanding mode. Now, HTML's policy for choosing names often prefers shorter names than are recommended for (La)T<sub>E</sub>X, so here I adopt a *third* police besides (i) and (ii) earlier; cf. L<sup>A</sup>T<sub>E</sub>X's `\textemdash` and `\textendash`. `\newcommand` does not accept macros whose names start with `end`, so: `\endash`, `\emdash` ...

```
145 \def \endash {\&ndash;} %% \end... illegal
```

```
146 \newcommand*{\emdash}{\&mdash;}
```

"Math" spaces `\enspace`, `\quad`, `\quad\quad`:

```
147 \renderHTMLsymbol{\enspace}{\ensp}
```

```
148 \renderHTMLsymbol{\quad}{\emsp}
```

```
149 \renewcommand*{\quad}{\quad\quad}
```

Quotes: `\lq`, `\rq` ... (TODO own subsection)

```
150  \renderHTMLsymbol{\lq}   {lsquo}
151  % \newcommand* {\rsquo} {\&rsquo;} %% removed 2010/04/26
152  \renderHTMLsymbol{\rq}   {rsquo}
```

In order to use the right single quote for the HTML apostrophe, we must save other uses before. `\screenqtd{\text{}}` is used for screen messages, and `\urlapostr` is the version of the right single quote for URLs (TODO which? Wikipedia?):

```
153  \newcommand*{\screenqtd}[1]{'#1'}
154  \newcommand*{\urlapostr} {'} %% 2010/09/10
```

Here finally is the change of `'`:

```
155  \MakeActiveDef\'{\&rsquo;}
... TODO \MakeActiveLet\'\rq! And this might better be in \BlogCodes!
would save \screenqtd! Tilde likewise!? ... TODO change \catcode`\'!?
2010/04/26
    [\ldquo, \rdquo, \sbquo, \prime, \Prime] ...
```

```
156  \declareHTMLsymbol{\ldquo}
157  \declareHTMLsymbol{\rdquo}
158  \declareHTMLsymbol{\sbquo} %% 2010/07/01
159  \renewcommand*{\prime}{\prime}
160  \declareHTMLsymbol{\Prime}
161  % \newcommand*{\Prime}{\Prime}
```

`\endqtd{\text{}}` quotes in the English style using double quote marks, `\enqtd{\text{}}` uses single quote marks instead, and `\dedqtd{\text{}}` quotes in German style:

```
162  \def\endqtd#1{\ldquo#1\rdquo} %% \newcommand: "\end"
163  \newcommand*\enqtd[1]{\lq#1\rq} %% 2010/09/08, \new... 2010/11/08
164  \newcommand*{\dedqtd}[1]{\bdquo;#1\ldquo}
```

... TODO `\bdquo!`?  
Some more letters: `\eacute`, `\ocirc` (“rôle”), `\Omega` ...

```
165  \declareHTMLsymbol{\eacute}
166  \declareHTMLsymbol{\ocirc}
167  \renderHTMLsymbol{\Omega} {\Omega} %% 2010/08/24
```

`\uml{\text{char}}` yields the umlaut for `\text{char}` (useful in macro definitions):

```
168  \newcommand* {\uml}[1] {\&\#1uml;} %% 2010/08/24
```

`\copyright`:

```
169  \renderHTMLsymbol{\copyright}{copy} %% 2010/08/24
```

Curly braces `\{` and `\}`:

```
170  \begin{group}
171      \Delimiters[\[] \gdef\{\{\} \gdef\}\[]]
172  \end{group}
```

### 3.8 T<sub>E</sub>X-related

Somebody actually using `blog.sty` must have a need to put down notes about T<sub>E</sub>X for her own private purposes at least—I expect.

#### 3.8.1 Logos

“Program” names might be typeset in a special font, I once thought, and started tagging program names with `\prg`. It could be `\texttt` or `\textsf` like in documentations of L<sup>A</sup>T<sub>E</sub>X packages. However, sans-serif is of doubtful usefulness on web pages, and typewriter imitations usually look terrible on web pages. So I am waiting for a better idea and let `\prg` just remove the braces.

```
173  \newcommand*{\prg}[1]{} \let\prg\@firstofone
174  \newcommand*{\BibTeX}{\prg{BibTeX}} %% 2010/09/13
175  \renewcommand*{\TeX}{\prg{TeX}}
176  \renewcommand*{\LaTeX}{\prg{LaTeX}}
177  \newcommand*{\allTeX}{\prg{(La)TeX}}%% 2010/10/05
178  \newcommand*{\LuaTeX}{\prg{LuaTeX}}
179  \newcommand*{\pdfTeX}{\prg{pdfTeX}}
180  \newcommand*{\XeTeX}{\prg{XeTeX}} %% 2010/10/09
181  \newcommand*{\TeXbook}{\TeXbook} %% 2010/09/13
```

#### 3.8.2 Else

With v0.4, T<sub>E</sub>X-related *links* are moved to `texlinks.sty`.

`\texcs{\langle tex-cmd-name\rangle}` or `\texcs{\langle tex-cmd-name\rangle}` (care for spacing yourself):

```
182  \newcommand*{\texcs}[1]{\code{\string#1}} %% 2010/11/13
```

### 3.9 Tables

These macros have proved somewhat bad. It may be better to re-implement tables support altogether.

There are three levels of indenting:

`\indenti`, `\indentii`, and `\indentiii`.

The intention for these was to get readable HTML code. Not sure ...

```
183  {\catcode`\ =12%% 2010/05/19
184  \gdef\indenti{ } \gdef\indentii{ } \gdef\indentiii{ }}
```

2010/07/17:

```
185  \newcommand*{\startTable}[1]{<table #1>}
186  \def\endTable{</table>}
```

2010/07/18:

```

187  \newcommand*{\starttr}{<tr>}
188  \def\endtr{</tr>}
189  \newcommand*{\startTd}[1]{<td #1>}
190  \def\endTd{</td>}
191  \newcommand*{\simplecell}{\SimpleTagSurr{td}}
192  \newcommand*{\@frame@box}{\@frame{box}}
193  \newcommand*{\@frame@groups}{\@frame{groups}}
194  \newenvironment{allrulestable}[2]
195    {\startTable{\@cellpadding{#1} \@width{#2}
196      \@frame@box rules="all"}^J%
197      \indenti<tbody>%
198      \indenti</tbody>}^J\endTable}
```

I first thought it would be good for readability if some HTML comments explain nesting or briefly describe the content of some column, row, or cell. But this is troublesome when you want to comment out an entire table ...

```

199  \newenvironment*{TableRow}[2]{%% weniger ^J 2010/05/18
200  % \indenti\ \comment{ #1 }^J%
```

← 2010/05/23 →

```
201  % \ \comment{ #1 }^J%
```

← 2010/07/18 →

```

202  \indenti \comment{ #1 }^J%
203  \indentii<tr #2>%
204  }{%
205  \indentii</tr>%
206  \newenvironment{tablecoloredrow}[2]
207    {\ TableRow{#1}{\@bgcolor{#2}}}
208    {\endTableRow}
```

”top” 2010/05/18:

```

209  \newenvironment{tablerow}[1]{\TableRow{#1}{valign="top"}}
210  {\endTableRow}
211  % \newcommand*{\TableCell}[2]{\indentiii<td #1>#2</td>%
212  % \newcommand*{\TableCell}[2]{\indentiii\TagSurr{td}{#1}{#2}%
213  %% <- 2010/07/18 ->
214  \newcommand*{\TableCell}[2]{\indentiii\startTd{#1}#2\endTd}
```

2010/06/15:

```

215  \newcommand*{\colorwidthcell}[2]{\TableCell{\@bgcolor{#1}\@width{#2}}}
216  \newcommand*{\tablewidthcell}[1]{\TableCell{\@width{#1}}}
217  \newcommand*{\tablecell}{}{\TableCell{}}
218  \newcommand*{\tableCell}{}{\TableCell{\@align@c}}
```

Idea: use closing star for environment variants!?

```

219  % %% 2010/05/19:
220  \newenvironment{bigtablecell}[1]{\BigTableCell{#1}{}}%
221  %                                     {\endBigTableCell}
222  %           {\ifx\\#1\\%               %% 2010/05/30
223  %             \indentii\ \comment{#1}^^J%
224  %           \fi
225  %           \indentiii<td>
226  %           {\indentii</td>}           %% !? 2010/05/23

```

Generalization 2010/06/28:

```

227  % \newcommand*{\FillRow}[2]{%           %% broke line 2011/01/24
228  %           \indentiii\TagSurr{td}{\@colspan{#1} #2}{}}%
229  % %% <- 2010/07/18 ->
230  \newcommand*{\FillRow}[2]{\indentiii\startTd{\@colspan{#1} #2}\endTd}
231  \newcommand*{\fillrow}[1]{\FillRow{#1}{}}%
232  \newcommand*{\fillrowcolor}[2]{\FillRow{#1}{\@bgcolor{#2}}}%

```

2010/06/05:

```

233  \newenvironment{BigTableCell}[2]
234  { \ifx\\#1\\ \indentii\ \comment{#1}^^J\fi
235  \indentiii\startTd{#2}%
236  \indentii\endTd}           %% TODO indent? 2010/07/18

```

### 3.10 Misc

`\comment{<comment>}` produces a one-line HTML comment. By contrast, there is an environment `\commentlines{<comment>}` for multi-line comments. It is convenient for “commenting out” code (unless the latter contains other HTML comments ...) where `<comment>` is a *comment* for explaining what is commented out.

```

237  \newcommand*{\comment}[1]{<!--#1-->}
238  % \newcommand{\commentlines}[1]{\comment{^^J#1^^J}} %% 2010/05/07
239  % %% <- TODO bzw. \endlinechar='\^J 2010/05/09 back 2010/05/10
240  \newenvironment{commentlines}[1]                   %% 2010/05/17
241  {<!--#1}
242  {-->}

```

TeX’s `\hrule` (rather deprecated in L<sup>A</sup>T<sub>E</sub>X) is redefined to produce an HTML horizontal line:

```
243  \renewcommand*{\hrule}{<hr>}
```

Redefining `\u` to be the same as `\space` may be helpful for manual indenting or spacing of HTML code. Or better (just now remembering): I used it for making “ASCII trees” with the `<pre>` element (redefined `verbatim`).

```
244  \let\ \space
```

I couldn't find a perfect way to generate `<p>`. Actually I started completing the present documentation when I had decided to implement automatic generation of `<p>` from empty lines.

```
245  % \def\par{<p>} %% + empty lines !? 2010/04/26
     ← difficult with \stop; 2010/09/10: [\endgraf] produces </p>!?
246  \renewcommand*{\endgraf}{</p>}
247  2010/04/28: <br> can be generated either by [\newline] or by [\\\]
248  \renewcommand*{\newline}{<br>}
249  \let\\=\newline
     [\rightpar{<text>}] places <text> flush right. I have used this for ‘Last revised
     ...’ and for placing navigation marks.
```

```
249  \newcommand*{\rightpar}{\TagSurr p\@align@r} %% 2010/06/17
```

For references, there were

```
250  % \catcode`^=\active
251  % \def^#1{\SimpleTagSurr{sup}{#1}}
```

and

```
252  % \newcommand*{\src}[1]{\SimpleTagSurr{sup}{[#1]}}
```

as of 2010/05/01, inspired by the `<ref>` element of MediaWiki; moved to `xmlprint.tex` 2010/06/02.

### 3.11 The End

```
253  \endinput
```

### 3.12 VERSION HISTORY

```
254  v0.1    2010/08/20 final version for DFG
255  v0.2    2010/11/08 final documentation version before
             moving some functionality to 'fifinddo'
256  v0.3    2010/11/10 removed ^^J from \head
257  2010/11/11 moving stuff to fifinddo.sty; \BlogCopyFile
258  2010/11/12 date updated; broke too long code lines etc. ;
259  2010/11/13 \CatCode replaced (implemented in niceverb only);
260  2010/11/13 \ifBlogAutoPars etc.
261  2010/11/13 doc: \uml useful in ...; \texcs
262  2010/11/14 doc: argument for {commentlines},
263  2010/11/14 referring to environments with curly braces,
264  2010/11/15 more on \ditem
265  2010/11/15 TODO: usage, templates
266  2010/11/16 note on {verbatim}
```

```
268      2010/11/23 doc. corr. on \CtanPkgRef
269      2010/11/27 "keyword"; \CopyLine without 'fd'
270      2010/12/03 \emhttppref -> \ithtppref
271      2010/12/23 '%' added to \texhaxpref
272      2011/01/23 more in \Provides...
273      2011/01/24 updated copyright; resolving 'td' ("today")
274      JUST STORED as final version before texlinks.sty
275 v0.4   2011/01/24 moving links to texlinks.sty
276 v0.41  2011/02/07 \NormalHTTPref
277      2011/02/10 refined call of 'texlinks'
278
```
