

The package **nicematrix**^{*}

F. Pantigny
fpantigny@wanadoo.fr

February 5, 2021

Abstract

The LaTeX package **nicematrix** provides new environments similar to the classical environments `{tabular}`, `{array}` and `{matrix}` of `array` and `amsmath` but with extended features.

$$\begin{bmatrix} \textcolor{blue}{C_1} & \textcolor{blue}{C_2} & \cdots & \textcolor{blue}{C_n} \\ \textcolor{blue}{L_1} & a_{11} & a_{12} & \cdots & a_{1n} \\ \textcolor{blue}{L_2} & a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \textcolor{blue}{L_n} & a_{n1} & a_{n2} & \cdots & a_{nn} \end{bmatrix}$$

Product	dimensions (cm)			Price
	L	l	h	
small	3	5.5	1	30
standard	5.5	8	1.5	50.5
premium	8.5	10.5	2	80
extra	8.5	10	1.5	85.5
special	12	12	0.5	70

The package **nicematrix** is entirely contained in the file `nicematrix.sty`. This file may be put in the current directory or in a `texmf` tree. However, the best is to install **nicematrix** with a TeX distribution as MiKTeX or TeXlive.

This package can be used with `xelatex`, `lualatex`, `pdflatex` but also by the classical workflow `latex-dvips-ps2pdf` (or Adobe Distiller). However, the file `nicematrix.dtx` of the present documentation should be compiled with XeLaTeX.

This package requires and **loads** the packages `l3keys2e`, `array`, `amsmath`, `pgfcore` and the module `shapes` of PGF (tikz, which is a layer over PGF is *not* loaded). The final user only has to load the package with `\usepackage{nicematrix}`.

The idea of **nicematrix** is to create PGF nodes under the cells and the positions of the rules of the tabular created by `array` and to use these nodes to develop new features. As usual with PGF, the coordinates of these nodes are written in the `.aux` to be used on the next compilation and that's why **nicematrix** may need **several compilations**.

Most features of **nicematrix** may be used without explicit use of PGF or Tikz (which, in fact, is not loaded by default).

A command `\NiceMatrixOptions` is provided to fix the options (the scope of the options fixed by this command is the current TeX group: they are semi-global).

Important

Since the version 5.0 of **nicematrix**, one must use the letters `l`, `c` and `r` in the preambles of the environments and no longer the letters `L`, `C` and `R`.

For sake of compatibility with the previous versions, there exists an option `define-L-C-R` which must be used when loading **nicematrix**.

```
\usepackage[define-L-C-R]{nicematrix}
```

*This document corresponds to the version 5.10 of **nicematrix**, at the date of 2021/02/05.

1 The environments of this package

The package `nicematrix` defines the following new environments.

```
{NiceTabular}    {NiceArray}    {NiceMatrix}
{NiceTabular*}   {pNiceArray}   {pNiceMatrix}
                {bNiceArray}   {bNiceMatrix}
                {BNiceArray}   {BNiceMatrix}
                {vNiceArray}   {vNiceMatrix}
                {VNiceArray}   {VNiceMatrix}
```

The environments `{NiceArray}`, `{NiceTabular}` and `{NiceTabular*}` are similar to the environments `{array}`, `{tabular}` and `{tabular*}` of the package `array` (which is loaded by `nicematrix`).

The environments `{pNiceArray}`, `{bNiceArray}`, etc. have no equivalent in `array`.

The environments `{NiceMatrix}`, `{pNiceMatrix}`, etc. are similar to the corresponding environments of `amsmath` (which is loaded by `nicematrix`): `{matrix}`, `{pmatrix}`, etc.

All the environments of the package `nicematrix` accept, between square brackets, an optional list of `key=value` pairs. **There must be no space before the opening bracket ([) of this list of options.**

Important

Before the version 5.0, it was mandatory to use, for technical reasons, the letters `L`, `C` et `R` instead of `l`, `c` et `r` in the preambles of the environments of `nicematrix`. If we want to be able to go on using these letters, `nicematrix` must be loaded with the option `define-L-C-R`.

```
\usepackage[define-L-C-R]{nicematrix}
```

2 The vertical space between the rows

It's well known that some rows of the arrays created by default with LaTeX are, by default, too close to each other. Here is a classical example.

```
$\begin{pmatrix}
\frac{1}{2} & -\frac{1}{2} \\
\frac{1}{3} & \frac{1}{4}
\end{pmatrix}
```

Inspired by the package `cellspace` which deals with that problem, the package `nicematrix` provides two keys `cell-space-top-limit` and `cell-space-bottom-limit` similar to the parameters `\cellspacetoplimit` and `\cellspacebottomlimit` of `cellspace`.

New 5.9 There is also a key `cell-space-limits` to set both parameters at once.

The initial value of these parameters is 0 pt in order to have for the environments of `nicematrix` the same behaviour as those of `array` and `amsmath`. However, a value of 1 pt would probably be a good choice and we suggest to set them with `\NiceMatrixOptions`.¹

```
\NiceMatrixOptions{cell-space-limits = 1pt}

$\begin{pmatrix}
\frac{1}{2} & -\frac{1}{2} \\
\frac{1}{3} & \frac{1}{4}
\end{pmatrix}
```

¹One should remark that these parameters apply also to the columns of type `S` of `siunitx` whereas the package `cellspace` is not able to act on such columns of type `S`.

3 The vertical position of the arrays

The package **nicematrix** provides a option **baseline** for the vertical position of the arrays. This option takes in as value an integer which is the number of the row on which the array will be aligned.

```
$A = \begin{pNiceMatrix} [baseline=2]
\frac{1}{\sqrt{1+p^2}} & p & 1-p \\
1 & 1 & 1 \\
1 & p & 1+p
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} \frac{1}{\sqrt{1+p^2}} & p & 1-p \\ 1 & 1 & 1 \\ 1 & p & 1+p \end{pmatrix}$$

It's also possible to use the option **baseline** with one of the special values **t**, **c** or **b**. These letters may also be used absolutely like the option of the environments **{tabular}** and **{array}** of **array**. The initial value of **baseline** is **c**.

In the following example, we use the option **t** (equivalent to **baseline=t**) immediately after an **\item** of list. One should remark that the presence of a **\hline** at the beginning of the array doesn't prevent the alignment of the baseline with the baseline of the first row (with **{tabular}** or **{array}** of **array**, one must use **\firsthline**).

```
\begin{enumerate}
\item an item
\smallskip
\item \renewcommand{\arraystretch}{1.2}
\$ \begin{NiceArray}[t]{lcccccc}
\hline
n & 0 & 1 & 2 & 3 & 4 & 5 \\
u_n & 1 & 2 & 4 & 8 & 16 & 32
\hline
\end{NiceArray}$
\end{enumerate}
```

1. an item

$$\begin{array}{ccccccc} n & 0 & 1 & 2 & 3 & 4 & 5 \\ u_n & 1 & 2 & 4 & 8 & 16 & 32 \end{array}$$

However, it's also possible to use the tools of **booktabs**: **\toprule**, **\bottomrule**, **\midrule**, etc.

```
\begin{enumerate}
\item an item
\smallskip
\item \begin{NiceArray}[t]{lcccccc}
\toprule
n & 0 & 1 & 2 & 3 & 4 & 5 \\
\midrule
u_n & 1 & 2 & 4 & 8 & 16 & 32
\bottomrule
\end{NiceArray}$
\end{enumerate}
```

1. an item

$$\begin{array}{ccccccc} n & 0 & 1 & 2 & 3 & 4 & 5 \\ u_n & 1 & 2 & 4 & 8 & 16 & 32 \end{array}$$

It's also possible to use the key **baseline** to align a matrix on an horizontal rule (drawn by **\hline**). In this aim, one should give the value **line-*i*** where *i* is the number of the row following the horizontal rule.

```
\NiceMatrixOptions{cell-space-limits=1pt}
```

```
$A=\begin{pNiceArray}{cc|cc} [baseline=line-3]
\dfrac{1}{A} & \dfrac{1}{B} & 0 & 0 \\
\dfrac{1}{C} & \dfrac{1}{D} & 0 & 0 \\
\hline
0 & 0 & A & B \\
0 & 0 & D & D \\
\end{pNiceArray}$
```

$$A = \left(\begin{array}{cc|cc} \frac{1}{A} & \frac{1}{B} & 0 & 0 \\ \frac{1}{C} & \frac{1}{D} & 0 & 0 \\ \hline 0 & 0 & A & B \\ 0 & 0 & D & D \end{array} \right)$$

4 The blocks

4.1 General case

In the environments of `nicematrix`, it's possible to use the command `\Block` in order to place an element in the center of a rectangle of merged cells of the array.

The command `\Block` must be used in the upper leftmost cell of the array with two arguments.

- The first argument is the size of the block with the syntax $i-j$ where i is the number of rows of the block and j its number of columns.

If this argument is empty, its default value is $1-1$. If the number of rows is not specified, or equal to $*$, the block extends until the last row (idem for the columns).

- The second argument is the content of the block. It's possible to use `\backslash` in that content to have a content on several lines. In `{NiceTabular}` the content of the block is composed in text mode whereas, in the other environments, it is composed in math mode.

Here is an example of utilisation of the command `\Block` in mathematical matrices.

```
$\begin{bNiceArray}{ccc|c}[margin]
\Block{3-3}{A} & & & 0 \\
& \hspace*{1cm} & & \vdots \\
& & 0 \\
\hline
0 & \cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[\begin{array}{ccc|c} & & & 0 \\ & A & & \vdots \\ & & & 0 \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

One may wish to raise the size of the “ A ” placed in the block of the previous example. Since this element is composed in math mode, it's not possible to use directly a command like `\large`, `\Large` and `\LARGE`. That's why the command `\Block` provides an option between angle brackets to specify some TeX code which will be inserted before the beginning of the math mode.²

```
$\begin{bNiceArray}{ccc|c}[margin]
\Block{3-3}<\Large>{A} & & & 0 \\
& \hspace*{1cm} & & \vdots \\
& & 0 \\
\hline
0 & \cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[\begin{array}{ccc|c} & & & 0 \\ & A & & \vdots \\ & & & 0 \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

It's possible to set the horizontal position of the block with one of the keys `l`, `c` and `r`.

```
$\begin{bNiceArray}{ccc|c}[margin]
\Block[r]{3-3}<\LARGE>{A} & & & 0 \\
& \hspace*{1cm} & & \vdots \\
& & 0 \\
\hline
0 & \cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[\begin{array}{ccc|c} & & & 0 \\ & & A & \vdots \\ & & & 0 \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

One must remark that, by default, the commands `\Blocks` don't create space. There is exception only for the blocks mono-row and the blocks mono-column as explained just below.

In the following example, we have had to enlarge by hand the columns 2 and 3 (with the construction `wc{...}` of array).

²This argument between angular brackets may also be used to insert a command of font such as `\bfseries` when the command `\backslash` is used in the content of the block.

```
\begin{NiceTabular}{cwc{2cm}wc{3cm}c}
rose      & tulipe & marguerite & dahlia \\
violette
& \Block[draw=red,fill=red!15]{2-2}{\LARGE De très jolies fleurs} & & souci \\
pervenche & & & lys \\
arum      & iris   & jacinthe & muguet
\end{NiceTabular}
```

rose	tulipe	marguerite	dahlia
violette	De très jolies fleurs		souci
pervenche			lys
arum	iris	jacinthe	muguet

As we can see on this example, it's possible to fill the block by using the key `fill` and to draw the frame with the key `draw`³. It's also possible to change the width (thickness) of that rules with the key `line-width`.

4.2 The mono-column blocks

The mono-column blocks have a special behaviour.

- The natural width of the contents of these blocks is taken into account for the width of the current column.
- The specification of the horizontal position provided by the type of column (`c`, `r` or `l`) is taken into account for the blocks.
- The specifications of font specified for the column by a construction `>{\dots}` in the preamble of the array are taken into account for the mono-column blocks of that column (this behaviour is probably expected).

```
\begin{NiceTabular}{@{}>{\bfseries}lr@{}}
\hline
\Block{2-1}{John} & 12 \\
& 13 \\ \hline
Steph & 8 \\ \hline
\Block{3-1}{Sarah} & 18 \\
& 17 \\ \hline
& 15 \\ \hline
Ashley & 20 \\ \hline
Henry & 14 \\ \hline
\Block{2-1}{Madison} & 15 \\
& 19 \\ \hline
\end{NiceTabular}
```

John	12
Steph	13
Sarah	8
	18
Ashley	17
Henry	15
Madison	20
	14
	15
	19

4.3 The mono-row blocks

For the mono-row blocks, the natural height and depth are taken into account for the height and depth of the current row (as does a standard `\multicolumn` of LaTeX).

4.4 The mono-cell blocks

A mono-cell block inherits all the properties of the mono-row blocks and mono-column blocks.

At first sight, one may think that there is no point using a mono-cell block. However, there are some good reasons to use such a block.

- It's possible to use the command `\\"` in a (mono-cell) block.

³If the key `draw` is used without value, the default color the rules of the tabulars is used

- It's possible to use the option of horizontal alignment of the block in derogation of the type of column given in the preamble of the array.
- It's possible do draw a frame around the cell with the key `draw` of the command `\Block`.⁴

```
\begin{NiceTabular}{cc}
\toprule
Writer & \Block[1]{}{year\\ of birth} \\
\midrule
Hugo & 1802 \\
Balzac & 1799 \\
\bottomrule
\end{NiceTabular}
```

Writer	year of birth
Hugo	1802
Balzac	1799

We recall that if the first mandatory argument of `\Block` is left blank, the block is mono-cell.⁵

4.5 A small remark

One should remark that the horizontal centering of the contents of the blocks is correct even when an instruction such as `!{\qquad}` has been used in the preamble of the array in order to increase the space between two columns (this is not the case with `\multicolumn`). In the following example, the header “First group” is correctly centered.

```
\begin{NiceTabular}{@{}c!{\qquad}ccc!{\qquad}ccc@{}}
\toprule
& \Block{1-3}{First group} & & \Block{1-3}{Second group} \\
Rank & 1A & 1B & 1C & 2A & 2B & 2C \\
\midrule
1 & 0.657 & 0.913 & 0.733 & 0.830 & 0.387 & 0.893 \\
2 & 0.343 & 0.537 & 0.655 & 0.690 & 0.471 & 0.333 \\
3 & 0.783 & 0.885 & 0.015 & 0.306 & 0.643 & 0.263 \\
4 & 0.161 & 0.708 & 0.386 & 0.257 & 0.074 & 0.336 \\
\bottomrule
\end{NiceTabular}
```

Rank	First group			Second group		
	1A	1B	1C	2A	2B	2C
1	0.657	0.913	0.733	0.830	0.387	0.893
2	0.343	0.537	0.655	0.690	0.471	0.333
3	0.783	0.885	0.015	0.306	0.643	0.263
4	0.161	0.708	0.386	0.257	0.074	0.336

5 The rules

The usual techniques for the rules may be used in the environments of `nicematrix` (excepted `\vline`). However, there is some small differences with the classical environments.

⁴If one wishes to color the background of a unique celle, there is no point using the command `\Block`: it's possible to use the command `\cellcolor` (when the key `colortbl-like` is used).

⁵One may consider that the default value of the first mandatory argument of `\Block` is `1-1`.

5.1 Some differences with the classical environments

5.1.1 The vertical rules

In the environments of `nicematrix`, the vertical rules specified by `|` in the preambles of the environments are never broken, even by an incomplete row or by a double horizontal rule specified by `\hline\hline` (there is no need to use `hhline`).⁶

```
\begin{NiceTabular}{|c|c|} \hline
First & Second \\ \hline\hline
Peter \\ \hline
Mary & George\\ \hline
\end{NiceTabular}
```

First	Second
Peter	
Mary	George

However, the vertical rules are not drawn in the blocks.

If you use `booktabs` (which provides `\toprule`, `\midrule`, `\bottomrule`, etc.) and if you really want to add vertical rules (which is not in the spirit of `booktabs`), you should notice that the vertical rules drawn by `nicematrix` are compatible with `booktabs`.

```
$\begin{NiceArray}{|cccc|} \toprule
a & b & c & d \\ \midrule
1 & 2 & 3 & 4 \\
1 & 2 & 3 & 4 \\ \bottomrule
\end{NiceArray}$
```

a	b	c	d
1	2	3	4
1	2	3	4

However, it's still possible to define a specifier (named, for instance, `I`) to draw vertical rules with the standard behaviour of `array`.

```
\newcolumntype{I}{!{\vrule}}
```

However, in this case, it is probably more clever to add a command `\OnlyMainNiceMatrix` (cf. p. 34):

```
\newcolumntype{I}{!{\OnlyMainNiceMatrix{\vrule}}}
```

5.1.2 The command `\cline`

The horizontal and vertical rules drawn by `\hline` and the specifier “`|`” make the array larger or wider by a quantity equal to the width of the rule (with `array` and also with `nicematrix`).

For historical reasons, this is not the case with the command `\cline`, as shown by the following example.

```
\setlength{\arrayrulewidth}{2pt}
\begin{tabular}{cccc} \hline
A&B&C&D \\ \cline{2-2}
A&B&C&D \\ \hline
\end{tabular}
```

A	B	C	D
A	<u>B</u>	C	D

In the environments of `nicematrix`, this situation is corrected (it's still possible to go to the standard behaviour of `\cline` with the key `standard-cline`).

```
\setlength{\arrayrulewidth}{2pt}
\begin{NiceTabular}{cccc} \hline
A&B&C&D \\ \cline{2-2}
A&B&C&D \\ \hline
\end{NiceTabular}
```

A	B	C	D
A	<u>B</u>	C	D

⁶This is the behaviour since the version 5.1 of `nicematrix`. Prior to that version, the behaviour was the standard behaviour of `array`.

5.2 The thickness and the color of the rules

The environments of `nicematrix` provide a key `rules/width` to set the width (in fact the thickness) of the rules in the current environment. In fact, this key merely sets the value of the length `\arrayrulewidth`.

It's well known that `colortbl` provides the command `\arrayrulecolor` in order to specify the color of the rules.

With `nicematrix`, it's possible to specify the color of the rules even when `colortbl` is not loaded. For sake of compatibility, the command is also named `\arrayrulecolor`. The environments of `nicematrix` also provide a key `rules/color` to fix the color of the rules in the current environment.

```
\begin{NiceTabular}{|ccc|}[rules/color=[gray]{0.9},rules/width=1pt]
\hline
rose & tulipe & lys \\
arum & iris & violette \\
muguet & dahlia & souci \\
\hline
\end{NiceTabular}
```

rose	tulipe	lys
arum	iris	violette
muguet	dahlia	souci

If one wishes to define new specifiers for columns in order to draw vertical rules (for example with a specific color or thicker than the standard rules), he should consider the command `\OnlyMainNiceMatrix` described on page 34.

5.3 The keys `hlines` and `vlines`

The key `hlines` draws all the horizontal rules and the key `vlines` draws all the vertical rules excepted in the blocks (and the virtual blocks determined by dotted lines). In fact, in the environments with delimiters (as `{pNiceMatrix}` or `{bNiceArray}`) the exteriors rules are not drawn (as expected).

```
$\begin{pNiceMatrix}[\vlines, rules/width=0.2pt]
1 & 2 & 3 & 4 & 5 & 6 \\
1 & 2 & 3 & 4 & 5 & 6 \\
1 & 2 & 3 & 4 & 5 & 6
\end{pNiceMatrix}$
```

$$\left(\begin{array}{|c|c|c|c|c|c|} \hline 1 & 2 & 3 & 4 & 5 & 6 \\ \hline 1 & 2 & 3 & 4 & 5 & 6 \\ \hline 1 & 2 & 3 & 4 & 5 & 6 \\ \hline \end{array} \right)$$

5.4 The key `hvlines`

The key `hvlines` draws all the vertical and horizontal rules (excepted in the blocks and the virtual blocks determined by dotted lines and excepted the rules corresponding of the frame of the blocks using the key `draw` which are drawn with their own characteristics).

```
\setlength{\arrayrulewidth}{1pt}
\begin{NiceTabular}{cccc}[\hvlines, rules/color=blue]
rose & tulipe & marguerite & dahlia \\
violette & \Block[draw=red]{2-2}{\LARGE fleurs} & & souci \\
pervenche & & lys \\
arum & iris & jacinthe & muguet
\end{NiceTabular}
```

rose	tulipe	marguerite	dahlia
violette	fleurs		souci
pervenche			lys
arum	iris	jacinthe	muguet

5.5 The key `hvlines-except-corners`

The key `hvlines-except-corners` draws all the horizontal and vertical rules, excepted in the blocks (and the virtual blocks determined by dotted lines) and excepted in the empty corners.

```
\begin{NiceTabular}{*{6}{c}}[hvlines-except-corners,cell-space-top-limit=3pt]
& & & & A \\
& & A & A & A \\
& & & A \\
& & A & A & A & A \\
A & A & A & A & A & A \\
A & A & A & A & A & A \\
& \Block{2-2}{B} & & A \\
& & & A \\
& A & A & A \\
\end{NiceTabular}
```

			A		
A	A	A			
	A				
	A	A	A	A	A
A	A	A	A	A	A
A	A	A	A	A	A
	B		A		
			A		
A	A	A			

As we can see, an “empty corner” is composed by the reunion of all the empty rectangles starting from the cell actually in the corner of the array.

It’s possible to give as value to the key `\hvlines-except-corners` a list of the corners to take into consideration. The corners are designed by NW, SW, NE and SE (*north west, south west, north east and south east*).

```
\begin{NiceTabular}{*{6}{c}}%
[hvlines-except-corners=NE,cell-space-top-limit=3pt]
\\
1&1\\
1&2&1\\
1&3&3&1\\
1&4&6&4&1\\
1&5&10&10&5&1
\end{NiceTabular}
```

1					
1	1				
1	2	1			
1	3	3	1		
1	4	6	4	1	
1	5	10	10	5	1

5.6 The command `\diagbox`

The command `\diagbox` (inspired by the package `diagbox`), allows, when it is used in a cell, to slash that cell diagonally downwards.⁷

```
$\begin{NiceArray}{*{5}{c}}[hvlines]
\diagbox{x}{y} & e & a & b & c \\
e & e & a & b & c \\
a & a & e & c & b \\
b & b & c & e & a \\
c & c & b & a & e
\end{NiceArray}$
```

x\y	e	a	b	c
e	e	a	b	c
a	a	e	c	b
b	b	c	e	a
c	c	b	a	e

It’s possible to use the command `\diagbox` in a `\Block`.

⁷The author of this document considers that type of construction as graphically poor.

5.7 Dotted rules

In the environments of the package `nicematrix`, it's possible to use the command `\hdottedline` (provided by `nicematrix`) which is a counterpart of the classical commands `\hline` and `\hdashline` (the latter is a command of `arydshln`).

```
\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
\hdottedline
6 & 7 & 8 & 9 & 10 \\
11 & 12 & 13 & 14 & 15
\end{pNiceMatrix}
```

$$\left(\begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ 6 & 7 & 8 & 9 & 10 \\ 11 & 12 & 13 & 14 & 15 \end{array} \right)$$

In the environments with an explicit preamble (like `{NiceTabular}`, `{NiceArray}`, etc.), it's possible to draw a vertical dotted line with the specifier “:”.

```
\left(\begin{NiceArray}{cccc:c}
1 & 2 & 3 & 4 & 5 \\
6 & 7 & 8 & 9 & 10 \\
11 & 12 & 13 & 14 & 15
\end{NiceArray}\right)
```

$$\left(\begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \\ 6 & 7 & 8 & 9 & 10 \\ 11 & 12 & 13 & 14 & 15 \end{array} \right)$$

It's possible to change in `nicematrix` the letter used to specify a vertical dotted line with the option `letter-for-dotted-lines` available in `\NiceMatrixOptions`. Thus released, the letter “:” can be used otherwise (for example by the package `arydshln`).

Remark : In the package `array` (on which the package `nicematrix` relies), horizontal and vertical rules make the array larger or wider by a quantity equal to the width of the rule⁸. In `nicematrix`, the dotted lines drawn by `\hdottedline` and “:” do likewise.

6 The color of the rows and columns

6.1 Use of `colortbl`

We recall that the package `colortbl` can be loaded directly with `\usepackage{colortbl}` or by loading `xcolor` with the key `table`: `\usepackage[table]{xcolor}`.

Since the package `nicematrix` is based on `array`, it's possible to use `colortbl` with `nicematrix`.

However, there are two drawbacks:

- The package `colortbl` patches `array`, leading to some incompatibilities (for example with the command `\hdotsfor`).
- The package `colortbl` constructs the array row by row, alternating colored rectangles, rules and contents of the cells. The resulting PDF is difficult to interpret by some PDF viewers and may lead to artefacts on the screen.
 - Some rules seem to disappear. This is because many PDF viewers give priority to graphical element drawn posteriorly (which is in the spirit of the “painting model” of PostScript and PDF). Concerning this problem, MuPDF (which is used, for instance, by SumatraPDF) gives better results than Adobe Reader).
 - A thin white line may appear between two cells of the same color. This phenomenon occurs when each cell is colored with its own instruction `fill` (the PostScript operator `fill` noted `f` in PDF). This is the case with `colortbl`: each cell is colored on its own, even when `\columncolor` or `\rowcolor` is used.

As for this phenomenon, Adobe Reader gives better results than MuPDF.

The package `nicematrix` provides tools to avoid those problems.

⁸In fact, this is true only for `\hline` and “|” but not for `\cline`: cf p. 7

6.2 The tools of nicematrix in the code-before

The package `nicematrix` provides some tools (independent of `colortbl`) to draw the colored panels first, and, then, the content of the cells and the rules. This strategy is more conform to the “painting model” of the formats PostScript and PDF and is more suitable for the PDF viewers. However, it requires several compilations.

The extension `nicematrix` provides a key `code-before` for some code that will be executed before the drawing of the tabular. In this `code-before`, new commands are available: `\cellcolor`, `\rectanglecolor`, `\rowcolor`, `\columncolor`, `\rowcolors` and `\chessboardcolors`.

All these commands accept an optional argument (between square brackets and in first position) which is the color model for the specification of the colors.

- The command `\cellcolor` takes its name from the command `\cellcolor` of `colortbl`. This command takes in as mandatory arguments a color and a list of cells, each of which with the format $i-j$ where i is the number of row and j the number of columnn of the cell.

```
\begin{NiceTabular}{|c|c|c|}[code-before =
\cellcolor{red!15}{3-1,2-2,1-3}]
\hline
a & b & c \\
e & f & g \\
h & i & j \\
\end{NiceTabular}
```

a	b	c
e	f	g
h	i	j

- The command `\rectanglecolor` takes three mandatory arguments. The first is the color. The second is the upper-left cell of the rectangle and the third is the lower-right cell of the rectangle.

```
\begin{NiceTabular}{|c|c|c|}[code-before =
\rectanglecolor{blue!15}{2-2}{3-3}]
\hline
a & b & c \\
e & f & g \\
h & i & j \\
\end{NiceTabular}
```

a	b	c
e	f	g
h	i	j

- The command `\rowcolor` takes its name from the command `\rowcolor` of `colortbl`. Its first mandatory argument is the color and the second is a comma-separated list of rows or interval of rows with the form $a-b$ (an interval of the form $a-$ represent all the rows from the row a until the end).

```
$\begin{NiceArray}{lll}[hvlines, code-before = \rowcolor{red!15}{1,3-5,8-}]
a_1 & b_1 & c_1 \\
a_2 & b_2 & c_2 \\
a_3 & b_3 & c_3 \\
a_4 & b_4 & c_4 \\
a_5 & b_5 & c_5 \\
a_6 & b_6 & c_6 \\
a_7 & b_7 & c_7 \\
a_8 & b_8 & c_8 \\
a_9 & b_9 & c_9 \\
a_{10} & b_{10} & c_{10} \\
\end{NiceArray}$
```

a_1	b_1	c_1
a_2	b_2	c_2
a_3	b_3	c_3
a_4	b_4	c_4
a_5	b_5	c_5
a_6	b_6	c_6
a_7	b_7	c_7
a_8	b_8	c_8
a_9	b_9	c_9
a_{10}	b_{10}	c_{10}

- The command `\columncolor` takes its name from the command `\columncolor` of `colortbl`. Its syntax is similar to the syntax of `\rowcolor`.

- The command `\rowcolors` (with a *s*) takes its name from the command `\rowcolors` of `xcolor`⁹. The *s* emphasizes the fact that there are *two* colors. This command colors alternately the rows of the tabular with the two colors (provided in second and third argument), beginning with the row whose number is given in first (mandatory) argument.

New 5.8 In fact, the first (mandatory) argument is, more generally, a comma separated list of intervals describing the rows involved in the action of `\rowcolors` (an interval of the form *i*-describes in fact the interval of all the rows of the tabular, beginning with the row *i*).

The last argument of `\rowcolors` is an optional list of pairs key-value (the optional argument in the first position corresponds to the colorimetric space). The available keys are `cols`, `restart` and `respect-blocks`.

- New 5.8 The key `cols` describes a set of columns. The command `\rowcolors` will color only the cells of these columns. The value is a comma-separated list of intervals of the form *i-j*.
- New 5.8 With the key `restart`, each interval of rows (specified by the first mandatory argument) begins with the same color.¹⁰
- With the key `respect-blocks` the “rows” alternately colored may extend over several rows if they have to incorporate blocks (created with the command `\Block`).

```
\begin{NiceTabular}{clr}
    [hvlines, code-before = {\rowcolors{2}{blue!10}{}[cols=2-3, restart]}]
\Block{1-}{Results} \\
John & 12 \\
Stephen & 8 \\
Sarah & 18 \\
Ashley & 20 \\
Henry & 14 \\
Madison & 15
\end{NiceTabular}
```

Results		
A	John	12
	Stephen	8
B	Sarah	18
	Ashley	20
	Henry	14
	Madison	15

```
\begin{NiceTabular}{lr}[hvlines, code-before =
\rowcolors{1}{blue!10}{}[respect-blocks]}
\Block{2-1}{John} & 12 \\
& 13 \\
& 13 \\
Steph & 8 \\
\Block{3-1}{Sarah} & 18 \\
& 17 \\
& 15 \\
Ashley & 20 \\
Henry & 14 \\
\Block{2-1}{Madison} & 15 \\
& 19
\end{NiceTabular}
```

John	12
	13
Steph	8
	18
Sarah	17
	15
Ashley	20
Henry	14
Madison	15
	19

- The command `\chessboardcolors` takes in as mandatory arguments two colors and it colors the cells of the tabular in quincunx with these colors.

```
$\begin{pNiceMatrix}[r, margin, code-before=\chessboardcolors{red!15}{blue!15}]
1 & -1 & 1 \\
-1 & 1 & -1 \\
1 & -1 & 1
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & -1 & 1 \\ -1 & 1 & -1 \\ 1 & -1 & 1 \end{pmatrix}$$

⁹The command `\rowcolors` of `xcolor` is available when `xcolor` is loaded with the option `table`.

¹⁰Otherwise, the color of a given row relies only upon the parity of its number.

We have used the key `r` which aligns all the columns rightwards (cf. p. 28).

One should remark that these commands are compatible with the commands of `booktabs` (`\toprule`, `\midrule`, `\bottomrule`, etc).

```
\begin{NiceTabular}[c]{lSSSS}%
[code-before = \rowcolor{red!15}{1-2} \rowcolors{3}{blue!15}{[]}]
\toprule
\Block{2-1}{Product} &
\Block{1-3}{dimensions (cm)} & & &
\Block{2-1}{\rotate Price} \\
\cmidrule(r1){2-4}
& L & l & h \\
\midrule
small & 3 & 5.5 & 1 & 30 \\
standard & 5.5 & 8 & 1.5 & 50.5 \\
premium & 8.5 & 10.5 & 2 & 80 \\
extra & 8.5 & 10 & 1.5 & 85.5 \\
special & 12 & 12 & 0.5 & 70 \\
\bottomrule
\end{NiceTabular}
```

Product	dimensions (cm)			Price
	L	l	h	
small	3	5.5	1	30
standard	5.5	8	1.5	50.5
premium	8.5	10.5	2	80
extra	8.5	10	1.5	85.5
special	12	12	0.5	70

We have used the type of column `S` of `siunitx`.

6.3 Color tools with the syntax of `colortbl`

It's possible to access the preceding tools with a syntax close to the syntax of `colortbl`. For that, one must use the key `colortbl-like` in the current environment.¹¹

There are three commands available (they are inspired by `colortbl` but are *independent* of `colortbl`):

- `\cellcolor` which colorizes a cell;
- `\rowcolor` which must be used in a cell and which colorizes the end of the row;
- `\columncolor` which must be used in the preamble of the environment with the same syntax as the corresponding command of `colortbl` (however, unlike the command `\columncolor` of `colortbl`, this command `\columncolor` can appear within another command, itself used in the preamble).

```
\NewDocumentCommand { \Blue } { } { \columncolor{blue!15} }
\begin{NiceTabular}[colortbl-like]{}>{\Blue}c>{\Blue}cc
\toprule
\rowcolor{red!15}
Last name & First name & Birth day \\
\midrule
Achard & Jacques & 5 juin 1962 \\
Lefebvre & Mathilde & 23 mai 1988 \\
Vanesse & Stephany & 30 octobre 1994 \\
Dupont & Chantal & 15 janvier 1998 \\
\bottomrule
\end{NiceTabular}
```

Last name	First name	Birth day
Achard	Jacques	5 juin 1962
Lefebvre	Mathilde	23 mai 1988
Vanesse	Stephany	30 octobre 1994
Dupont	Chantal	15 janvier 1998

¹¹ As of now, this key is not available in `\NiceMatrixOptions`.

7 The width of the columns

In the environments with an explicit preamble (like `{NiceTabular}`, `{NiceArray}`, etc.), it's possible to fix the width of a given column with the standard letters `w` and `W` of the package `array`.

```
\begin{NiceTabular}{Wc{2cm}cc}[hvlines]
Paris & New York & Madrid \\
Berlin & London & Roma \\
Rio & Tokyo & Oslo
\end{NiceTabular}
```

Paris	New York	Madrid
Berlin	London	Roma
Rio	Tokyo	Oslo

In the environments of `nicematrix`, it's also possible to fix the *minimal* width of all the columns of an array directly with the key `columns-width`.

```
$\begin{pNiceMatrix} [columns-width = 1cm]
1 & 12 & -123 \\
12 & 0 & 0 \\
4 & 1 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 12 & -123 \\ 12 & 0 & 0 \\ 4 & 1 & 2 \end{pmatrix}$$

Note that the space inserted between two columns (equal to `2 \tabcolsep` in `{NiceTabular}` and to `2 \arraycolsep` in the other environments) is not suppressed (of course, it's possible to suppress this space by setting `\tabcolsep` or `\arraycolsep` equal to 0 pt before the environment).

It's possible to give the special value `auto` to the option `columns-width`: all the columns of the array will have a width equal to the widest cell of the array.¹²

```
$\begin{pNiceMatrix} [columns-width = auto]
1 & 12 & -123 \\
12 & 0 & 0 \\
4 & 1 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 12 & -123 \\ 12 & 0 & 0 \\ 4 & 1 & 2 \end{pmatrix}$$

Without surprise, it's possible to fix the minimal width of the columns of all the matrices of a current scope with the command `\NiceMatrixOptions`.

```
\NiceMatrixOptions{columns-width=10mm}
$\begin{pNiceMatrix}
a & b \\
c & d
\end{pNiceMatrix}
=
$\begin{pNiceMatrix}
1 & 1245 \\
345 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} 1 & 1245 \\ 345 & 2 \end{pmatrix}$$

But it's also possible to fix a zone where all the matrices will have their columns of the same width, equal to the widest cell of all the matrices. This construction uses the environment `{NiceMatrixBlock}` with the option `auto-columns-width`¹³. The environment `{NiceMatrixBlock}` has no direct link with the command `\Block` presented previously in this document (cf. p. 4).

```
\begin{NiceMatrixBlock} [auto-columns-width]
$\begin{array}{c}
\begin{bNiceMatrix}
9 & 17 \\
-2 & 5
\end{bNiceMatrix} \\
\begin{bNiceMatrix}
1 & 1245345 \\
345 & 2
\end{bNiceMatrix}
\end{array}
\end{NiceMatrixBlock}
```

$$\begin{bmatrix} 9 & 17 \\ -2 & 5 \end{bmatrix} \quad \begin{bmatrix} 1 & 1245345 \\ 345 & 2 \end{bmatrix}$$

¹²The result is achieved with only one compilation (but PGF/Tikz will have written informations in the `.aux` file and a message requiring a second compilation will appear).

¹³At this time, this is the only usage of the environment `{NiceMatrixBlock}` but it may have other usages in the future.

Several compilations may be necessary to achieve the job.

8 The exterior rows and columns

The options `first-row`, `last-row`, `first-col` and `last-col` allow the composition of exterior rows and columns in the environments of `nicematrix`.

A potential “first row” (exterior) has the number 0 (and not 1). Idem for the potential “first column”.

```
$\begin{pNiceMatrix}[\mathbf{first-row},\mathbf{last-row},\mathbf{first-col},\mathbf{last-col}]\\
$\begin{pNiceMatrix}[\mathbf{first-row},\mathbf{last-row},\mathbf{first-col},\mathbf{last-col},\mathbf{nullify-dots}]\\
    & C_1 & \cdots & C_4 & & \\ 
L_1 & a_{11} & a_{12} & a_{13} & a_{14} & L_1 \\ 
\vdots & a_{21} & a_{22} & a_{23} & a_{24} & \vdots \\ 
& a_{31} & a_{32} & a_{33} & a_{34} & \\ 
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 \\ 
    & C_1 & \cdots & C_4 & & \\ 
\end{pNiceMatrix}$
\end{pNiceMatrix}$
```

$$\begin{array}{c} C_1 \dots \dots \dots C_4 \\ L_1 \left(\begin{array}{cccc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right) L_4 \\ \vdots \quad \vdots \quad \vdots \quad \vdots \\ C_1 \dots \dots \dots C_4 \end{array}$$

The dotted lines have been drawn with the tools presented p. 16.

We have several remarks to do.

- For the environments with an explicit preamble (i.e. `{NiceArray}` and its variants), no letter must be given in that preamble for the potential first column and the potential last column: they will automatically (and necessarily) be of type `r` for the first column and `l` for the last one.
- One may wonder how `nicematrix` determines the number of rows and columns which are needed for the composition of the “last row” and “last column”.
 - For the environments with explicit preamble, like `{NiceTabular}` and `{pNiceArray}`, the number of columns can obviously be computed from the preamble.
 - When the option `light-syntax` (cf. p. 30) is used, `nicematrix` has, in any case, to load the whole body of the environment (and that’s why it’s not possible to put verbatim material in the array with the option `light-syntax`). The analysis of this whole body gives the number of rows (but not the number of columns).
 - In the other cases, `nicematrix` compute the number of rows and columns during the first compilation and write the result in the `aux` file for the next run.

However, it’s possible to provide the number of the last row and the number of the last column as values of the options `last-row` and `last-col`, tending to an acceleration of the whole compilation of the document. That’s what we will do throughout the rest of the document.

It’s possible to control the appearance of these rows and columns with options `code-for-first-row`, `code-for-last-row`, `code-for-first-col` and `code-for-last-col`. These options specify tokens that will be inserted before each cell of the corresponding row or column.

```
\NiceMatrixOptions{code-for-first-row = \color{red},
                  code-for-first-col = \color{blue},
                  code-for-last-row = \color{green},
                  code-for-last-col = \color{magenta}}
$\begin{pNiceArray}{cc|cc}[first-row,last-row=5,first-col,last-col,nullify-dots]
& C_1 & \cdots & C_4 \\
L_1 & a_{11} & a_{12} & a_{13} & a_{14} & L_1 \\
\vdots & a_{21} & a_{22} & a_{23} & a_{24} & \vdots \\
\hline
& a_{31} & a_{32} & a_{33} & a_{34} & \\
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 \\
& C_1 & \cdots & C_4 & \\
\end{pNiceArray}$
```

$$\begin{array}{c|cc|cc} & \color{red}C_1 & \cdots & \color{red}C_4 \\ \color{blue}L_1 & \left(\begin{array}{cc|cc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \end{array} \right) & \color{blue}L_1 \\ \vdots & & \vdots & \vdots \\ \color{blue}L_4 & \left(\begin{array}{cc|cc} a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right) & \color{blue}L_4 \\ & \color{green}C_1 & \cdots & \color{green}C_4 \end{array}$$

Remarks

- As shown in the previous example, the horizontal and vertical rules doesn't extend in the exterior rows and columns.

However, if one wishes to define new specifiers for columns in order to draw vertical rules (for example thicker than the standard rules), he should consider the command `\OnlyMainNiceMatrix` described on page 34.

- A specification of color present in `code-for-first-row` also applies to a dotted line draw in this exterior “first row” (excepted if a value has been given to `xdots/color`). Idem for the other exterior rows and columns.
- Logically, the potential option `columns-width` (described p. 14) doesn't apply to the “first column” and “last column”.
- For technical reasons, it's not possible to use the option of the command `\\\` after the “first row” or before the “last row” (the placement of the delimiters would be wrong).

9 The continuous dotted lines

Inside the environments of the package `nicematrix`, new commands are defined: `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Idots`. These commands are intended to be used in place of `\dots`, `\cdots`, `\vdots`, `\ddots` and `\iddots`.¹⁴

Each of them must be used alone in the cell of the array and it draws a dotted line between the first non-empty cells¹⁵ on both sides of the current cell. Of course, for `\Ldots` and `\Cdots`, it's an horizontal line; for `\Vdots`, it's a vertical line and for `\Ddots` and `\Idots` diagonal ones. It's possible

¹⁴The command `\iddots`, defined in `nicematrix`, is a variant of `\ddots` with dots going forward. If `mathdots` is loaded, the version of `mathdots` is used. It corresponds to the command `\adots` of `unicode-math`.

¹⁵The precise definition of a “non-empty cell” is given below (cf. p. 35).

to change the color of these lines with the option `color`.¹⁶

```
\begin{bNiceMatrix}
a_1 & \Cdots & & a_1 & \\
\Vdots & a_2 & \Cdots & a_2 & \\
& \Vdots & \Ddots[color=red] & & \\
& a_1 & a_2 & & a_n
\end{bNiceMatrix}
```

$$\begin{bmatrix} a_1 & \cdots & \cdots & a_1 \\ \vdots & & a_2 & \cdots \\ a_1 & a_2 & & a_n \end{bmatrix}$$

In order to represent the null matrix, one can use the following codage:

```
\begin{bNiceMatrix}
0 & \Cdots & 0 & \\
\Vdots & & \Vdots & \\
0 & \Cdots & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & 0 \\ \vdots & & \vdots \\ 0 & \cdots & 0 \end{bmatrix}$$

However, one may want a larger matrix. Usually, in such a case, the users of LaTeX add a new row and a new column. It's possible to use the same method with `nicematrix`:

```
\begin{bNiceMatrix}
0 & \Cdots & \Cdots & 0 & \\
\Vdots & & & \Vdots & \\
\Vdots & & & \Vdots & \\
0 & \Cdots & \Cdots & 0 &
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & \cdots & 0 \\ \vdots & & & \vdots \\ \vdots & & & \vdots \\ 0 & \cdots & \cdots & 0 \end{bmatrix}$$

In the first column of this exemple, there are two instructions `\Vdots` but, of course, only one dotted line is drawn.

In fact, in this example, it would be possible to draw the same matrix more easily with the following code:

```
\begin{bNiceMatrix}
0 & \Cdots & & 0 & \\
\Vdots & & & & \\
& & & \Vdots & \\
0 & & & \Cdots &
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & & 0 \\ \vdots & & & \vdots \\ & & & \vdots \\ 0 & \cdots & & 0 \end{bmatrix}$$

There are also other means to change the size of the matrix. Someone might want to use the optional argument of the command `\Vdots` for the vertical dimension and a command `\hspace*` in a cell for the horizontal dimension.¹⁷

However, a command `\hspace*` might interfer with the construction of the dotted lines. That's why the package `nicematrix` provides a command `\Hspace` which is a variant of `\hspace` transparent for the dotted lines of `nicematrix`.

```
\begin{bNiceMatrix}
0 & \Cdots & \Hspace*[1cm] & 0 & \\
\Vdots & & & \Vdots & \\
0 & \Cdots & & 0 &
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & & 0 \\ \vdots & & & \vdots \\ 0 & \cdots & & 0 \end{bmatrix}$$

¹⁶It's also possible to change the color of all theses dotted lines with the option `xdots/color` (`xdots` to remind that it works for `\Cdots`, `\Ldots`, `\Vdots`, etc.); cf. p. 20.

¹⁷In `nicematrix`, one should use `\hspace*` and not `\hspace` for such an usage because `nicematrix` loads `array`. One may also remark that it's possible to fix the width of a column by using the environment `{NiceArray}` (or one of its variants) with a column of type `w` or `W`: see p. 14

9.1 The option `nullify-dots`

Consider the following matrix composed classically with the environment `{pmatrix}` of `amsmath`.

```
$A = \begin{pmatrix} h & i & j & k & l & m \\ x & & & & & x \\ \end{pmatrix}
```

$$A = \begin{pmatrix} h & i & j & k & l & m \\ x & & & & & x \end{pmatrix}$$

If we add `\ldots` instructions in the second row, the geometry of the matrix is modified.

```
$B = \begin{pmatrix} h & i & j & k & l & m \\ x & \ldots & \ldots & \ldots & \ldots & x \\ \end{pmatrix}
```

$$B = \begin{pmatrix} h & i & j & k & l & m \\ x & \ldots & \ldots & \ldots & \ldots & x \end{pmatrix}$$

By default, with `nicematrix`, if we replace `{pmatrix}` by `{pNiceMatrix}` and `\ldots` by `\Ldots`, the geometry of the matrix is not changed.

```
$C = \begin{pNiceMatrix} h & i & j & k & l & m \\ x & \Ldots & \Ldots & \Ldots & \Ldots & x \\ \end{pNiceMatrix}
```

$$C = \begin{pmatrix} h & i & j & k & l & m \\ x & \ldots & \ldots & \ldots & \ldots & x \end{pmatrix}$$

However, one may prefer the geometry of the first matrix A and would like to have such a geometry with a dotted line in the second row. It's possible by using the option `nullify-dots` (and only one instruction `\Ldots` is necessary).

```
$D = \begin{pNiceMatrix} [nullify-dots] h & i & j & k & l & m \\ x & \Ldots & & & & x \\ \end{pNiceMatrix}
```

$$D = \begin{pmatrix} h & i & j & k & l & m \\ x & \ldots & & & & x \end{pmatrix}$$

The option `nullify-dots` smashes the instructions `\Ldots` (and the variants) horizontally but also vertically.

9.2 The commands `\Hdotsfor` and `\Vdotsfor`

Some people commonly use the command `\hdotsfor` of `amsmath` in order to draw horizontal dotted lines in a matrix. In the environments of `nicematrix`, one should use instead `\Hdotsfor` in order to draw dotted lines similar to the other dotted lines drawn by the package `nicematrix`.

As with the other commands of `nicematrix` (like `\Cdots`, `\Ldots`, `\Vdots`, etc.), the dotted line drawn with `\Hdotsfor` extends until the contents of the cells on both sides.

```
$\begin{pNiceMatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & \Hdotsfor{3} & 5 \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \\ \end{pNiceMatrix}
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & \ldots & \ldots & \ldots & 5 \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}$$

However, if these cells are empty, the dotted line extends only in the cells specified by the argument of `\Hdotsfor` (by design).

```
$\begin{pNiceMatrix} 1 & 2 & 3 & 4 & 5 \\ & \Hdotsfor{3} \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \\ \end{pNiceMatrix}
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ & \ldots & \ldots & \ldots & \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}$$

Remark: Unlike the command `\hdotsfor` of `amsmath`, the command `\Hdotsfor` may be used when the package `colortbl` is loaded (but you might have problem if you use `\rowcolor` on the same row as `\Hdotsfor`).

The package `nicematrix` also provides a command `\Vdotsfor` similar to `\Hdotsfor` but for the vertical dotted lines. The following example uses both `\Hdotsfor` and `\Vdotsfor`:

```
\begin{bNiceMatrix}
C[a_1,a_1] & \Cdots & C[a_1,a_n]
& \hspace*{20mm} & C[a_1,a_1^{(p)}] & \Cdots & C[a_1,a_n^{(p)}] \\
\Vdots & \Hdotsfor{1} & \Vdots & \Ddots & \Vdots \\
C[a_n,a_1] & \Cdots & C[a_n,a_n]
& & C[a_n,a_1^{(p)}] & \Cdots & C[a_n,a_n^{(p)}] \\
\rule{0pt}{15mm} & \Vdotsfor{1} & \Ddots & \Vdotsfor{1} \\
C[a_1^{(p)},a_1] & \Cdots & C[a_1^{(p)},a_n]
& & C[a_1^{(p)},a_1^{(p)}] & \Cdots & C[a_1^{(p)},a_n^{(p)}] \\
\Vdots & \Ddots & \Vdots \\
& \Hdotsfor{1} & \Vdots & \Ddots & \Vdots \\
C[a_n^{(p)},a_1] & \Cdots & C[a_n^{(p)},a_n]
& & C[a_n^{(p)},a_1^{(p)}] & \Cdots & C[a_n^{(p)},a_n^{(p)}] \\
\end{bNiceMatrix}
```

$$\left[\begin{array}{ccc|ccc} C[a_1,a_1] & \cdots & C[a_1,a_n] & C[a_1,a_1^{(p)}] & \cdots & C[a_1,a_n^{(p)}] \\ \vdots & & \vdots & \vdots & & \vdots \\ C[a_n,a_1] & \cdots & C[a_n,a_n] & C[a_n,a_1^{(p)}] & \cdots & C[a_n,a_n^{(p)}] \\ \vdots & & \vdots & \vdots & & \vdots \\ C[a_1^{(p)},a_1] & \cdots & C[a_1^{(p)},a_n] & C[a_1^{(p)},a_1^{(p)}] & \cdots & C[a_1^{(p)},a_n^{(p)}] \\ \vdots & & \vdots & \vdots & & \vdots \\ C[a_n^{(p)},a_1] & \cdots & C[a_n^{(p)},a_n] & C[a_n^{(p)},a_1^{(p)}] & \cdots & C[a_n^{(p)},a_n^{(p)}] \end{array} \right]$$

9.3 How to generate the continuous dotted lines transparently

Imagine you have a document with a great number of mathematical matrices with ellipsis. You may wish to use the dotted lines of `nicematrix` without having to modify the code of each matrix. It's possible with the keys `renew-dots` and `renew-matrix`.¹⁸

- The option `renew-dots`

With this option, the commands `\ldots`, `\cdots`, `\vdots`, `\ddots`, `\iddots`¹⁴ and `\hdotsfor` are redefined within the environments provided by `nicematrix` and behave like `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor`; the command `\dots` ("automatic dots" of `amsmath`) is also redefined to behave like `\Ldots`.

- The option `renew-matrix`

With this option, the environment `{matrix}` is redefined and behave like `{NiceMatrix}`, and so on for the five variants.

Therefore, with the keys `renew-dots` and `renew-matrix`, a classical code gives directly the output of

¹⁸The options `renew-dots`, `renew-matrix` can be fixed with the command `\NiceMatrixOptions` like the other options. However, they can also be fixed as options of the command `\usepackage`. There is also a key `transparent` which is an alias for the conjunction of `renew-dots` and `renew-matrix` but it must be considered as obsolete.

nicematrix.

```
\NiceMatrixOptions{renew-dots,renew-matrix}
\begin{pmatrix}
1 & \cdots & \cdots & \cdots & 1 \\
0 & \ddots & & \vdots & \\
\vdots & \ddots & \ddots & \vdots & \\
0 & \cdots & 0 & \cdots & 1
\end{pmatrix}
```

$$\begin{pmatrix} 1 & \cdots & \cdots & \cdots & 1 \\ 0 & \ddots & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ 0 & \cdots & 0 & \cdots & 1 \end{pmatrix}$$

9.4 The labels of the dotted lines

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` (and the command `\line` in the `\CodeAfter` which is described p. 21) accept two optional arguments specified by the tokens `_` and `^` for labels positionned below and above the line. The arguments are composed in math mode with `\scriptstyle`.

```
$\begin{bNiceMatrix}
1 & \hspace{1cm} & & & 0 \\[8mm]
& \Ddots^{n \text{ text{ times}}} & & & \\
0 & & & & 1
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 1 & & & & 0 \\ & \cdots & \cdots & \cdots & \\ & n \text{ times} & & & \\ 0 & & & & 1 \end{bmatrix}$$

9.5 Customization of the dotted lines

The dotted lines drawn by `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` (and by the command `\line` in the `\CodeAfter` which is described p. 21) may be customized by three options (specified between square brackets after the command):

- `color`;
- `shorten`;
- `line-style`.

These options may also be fixed with `\NiceMatrixOptions` or at the level of a given environment but, in those cases, they must be prefixed by `xdots`, and, thus have for names:

- `xdots/color`;
- `xdots/shorten`;
- `xdots/line-style`.

For the clarity of the explanations, we will use those names.

The option `xdots/color`

The option `xdots/color` fixes the color or the dotted line. However, one should remark that the dotted lines drawn in the exterior rows and columns have a special treatment: cf. p. 15.

The option `xdots/shorten`

The option `xdots/shorten` fixes the margin of both extremities of the line. The name is derived from the options “`shorten >`” and “`shorten <`” of Tikz but one should notice that `nicematrix` only provides `xdots/shorten`. The initial value of this parameter is 0.3 em (it is recommended to use a unit of length dependent of the current font).

The option `xdots/line-style`

It should be pointed that, by default, the lines drawn by Tikz with the parameter `dotted` are composed of square dots (and not rounded ones).¹⁹

¹⁹The first reason of this behaviour is that the PDF format includes a description for dashed lines. The lines specified with this descriptor are displayed very efficiently by the PDF readers. It's easy, starting from these dashed lines, to create a line composed by square dots whereas a line of rounded dots needs a specification of each dot in the PDF file.

```
\tikz \draw [dotted] (0,0) -- (5,0) ;
```

In order to provide lines with rounded dots in the style of those provided by `\ldots` (at least with the *Computer Modern* fonts), the package `nicematrix` embeds its own system to draw a dotted line (and this system uses PGF and not Tikz). This style is called `standard` and that's the initial value of the parameter `xdots/line-style`.

However (when Tikz is loaded) it's possible to use for `xdots/line-style` any style provided by Tikz, that is to say any sequence of options provided by Tikz for the Tizk pathes (with the exception of “`color`”, “`shorten >`” and “`shorten <`”).

Here is for example a tridiagonal matrix with the style `loosely dotted`:

```
$\begin{pNiceMatrix} [nullify-dots, xdots/line-style=loosely dotted]
a & b & 0 & & \Cdots & 0 & \\
b & a & b & \Ddots & & \Vdots & \\
0 & b & a & \Ddots & & & \\
& \Ddots & \Ddots & \Ddots & & 0 & \\
& \Vdots & & & & b & \\
0 & & \Cdots & 0 & b & a
\end{pNiceMatrix}$
```

$$\begin{pmatrix} a & b & 0 & \cdots & 0 \\ b & a & b & \ddots & \vdots \\ 0 & b & a & \ddots & \vdots \\ \vdots & \ddots & \ddots & \ddots & 0 \\ 0 & \cdots & 0 & b & a \end{pmatrix}$$

9.6 The dotted lines and the rules

The dotted lines determine virtual blocks which have the same behaviour regarding the rules (the rules specified by the specifier `|` in the preamble and by the keys `hlines`, `vlines`, `hvlines` and `hvlines-except-corners` are not drawn within the blocks).

```
$\begin{bNiceMatrix} [margin, hvlines]
\Block{3-3}{\text{A}} & & 0 & \\
& \hspace*{1cm} & \Vdots & \\
& & 0 & \\
0 & \Cdots & 0 & 0
\end{bNiceMatrix}$
```

$$\left[\begin{array}{ccc|c} & & & 0 \\ A & & & \vdots \\ & & & 0 \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

10 The `\CodeAfter`

The option `code-after` may be used to give some code that will be executed after the construction of the matrix.²⁰

For the legibility of the code, an alternative syntax is provided: it's possible to give the instructions of the `\code-after` at the end of the environment, after the keyword `\CodeAfter`.

Two special commands are available in the `\CodeAfter`: `line` and `\SubMatrix`.

10.1 The command `\line` in the `\CodeAfter`

The command `\line` draws directly dotted lines between nodes. It takes two arguments for the two cells to rely, both of the form $i-j$ where i is the number of row and j is the number of column. It may be used, for example, to draw a dotted line between two adjacent cells.

²⁰There is also a key `code-before` described p. 11.

```
\NiceMatrixOptions{xdots/shorten = 0.6 em}
\begin{pNiceMatrix}
I & 0 & \cdots & 0 \\
0 & I & \ddots & \\ 
\vdots & \ddots & I & 0 \\
0 & \cdots & 0 & I
\CodeAfter \line{2-2}{3-3}
\end{pNiceMatrix}
```

$$\begin{pmatrix} I & 0 & \cdots & 0 \\ 0 & I & & \\ \vdots & \ddots & \ddots & \\ 0 & \cdots & 0 & I \end{pmatrix}$$

10.2 The command \SubMatrix in the \CodeAfter

New 5.10 The command `\SubMatrix` provides a way to put delimiters on an portion of the array considered as a submatrix. The command `\SubMatrix` takes in five arguments:

- the first argument is the left delimiter, which may be any extensible delimiter provided by LaTeX : (, [, \{, \langle, \lgroup, \lfloor, etc. but also the null delimiter .;
- the second argument is the upper-left corner of the submatrix with the syntax $i-j$ where i the number of row and j the number of column;
- the third argument is the lower-right corner with the same syntax;
- the fourth argument is the right delimiter;
- the last argument, which is optional, is a list of key-value pairs.

One should remark that the command `\SubMatrix` draws the delimiters after the construction of the array: no space is inserted by the command `\SubMatrix` itself. That's why, in the following example, we have used the key `margin` and you have added by hand some space between the third and fourth column with `@{\hspace{1.5em}}` in the preamble of the array.

```
\[\begin{NiceArray}{ccc@{\hspace{1.5em}}c}%
    [cell-space-limits=2pt,margin]
    1 & 1 & 1 & x \\
    \dfrac{1}{4} & \dfrac{1}{2} & \dfrac{1}{4} & y \\
    1 & 2 & 3 & z
\CodeAfter
\SubMatrix({1-1}{3-3})
\SubMatrix({1-4}{3-4})
\end{NiceArray}\]
```

$$\begin{pmatrix} 1 & 1 & 1 \\ \frac{1}{4} & \frac{1}{2} & \frac{1}{4} \\ 1 & 2 & 3 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

The options of the command `\SubMatrix` are as follows:

- `left-xshift` and `right-shift` shift horizontally the delimiters (there exists also the key `xshift` which fixes both parameters);
- `extra-height` adds a quantity to the total height of the delimiters (height `\ht + depth \dp`);
- `delimiters-color` fixes the color of the delimiters (also available in `\NiceMatrixOptions`, in the environments with delimiters and as option of the command `\CodeAfter`);
- `slim` is a boolean key: when that key is in force, the horizontal position of the delimiters is computed by using only the contents of the cells of the submatrix whereas, in the general case, the position is computed by taking into account the cells of the whole columns implied in the submatrix (see example below).

These keys are also available in `\NiceMatrixOptions`, at the level of the environments of `nicematrix` or as option of the command `\CodeAfter` with the prefix `sub-matrix` which means that their names are therefore `sub-matrix/left-xshift`, `sub-matrix/right-xshift`, `sub-matrix/xshift`, etc.

```
$\begin{NiceArray}{cc@{\hspace{5mm}}l}%
    [cell-space-limits=2pt]
    & & \frac{1}{2} \\
    & & \frac{1}{4} \\
a & b & \frac{1}{2}a + \frac{1}{4}b \\
c & d & \frac{1}{2}c + \frac{1}{4}d \\
\CodeAfter
\SubMatrix({1-3}{2-3}) \\
\SubMatrix({3-1}{4-2}) \\
\SubMatrix({3-3}{4-3}) \\
\end{NiceArray}$
```

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} \frac{1}{2} & \\ \frac{1}{4} & \end{pmatrix}$$

Here is the same example with the key `slim` used for one of the submatrices.

```
$\begin{NiceArray}{cc@{\hspace{5mm}}l}%
    [cell-space-limits=2pt]
    & & \frac{1}{2} \\
    & & \frac{1}{4} \\
a & b & \frac{1}{2}a + \frac{1}{4}b \\
c & d & \frac{1}{2}c + \frac{1}{4}d \\
\CodeAfter
\SubMatrix({1-3}{2-3}) [slim] \\
\SubMatrix({3-1}{4-2}) \\
\SubMatrix({3-3}{4-3}) \\
\end{NiceArray}$
```

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} \frac{1}{2} & \\ \frac{1}{4} & \end{pmatrix}$$

There is also a key `name` which gives a name to the submatrix created by `\SubMatrix`. That name is used to created PGF/Tiks nodes: cf p. 33.

11 The notes in the tabulars

11.1 The footnotes

The package `nicematrix` allows, by using `footnote` or `footnotehyper`, the extraction of the notes inserted by `\footnote` in the environments of `nicematrix` and their composition in the footpage with the other notes of the document.

If `nicematrix` is loaded with the option `footnote` (with `\usepackage[footnote]{nicematrix}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `nicematrix` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) ant it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferently. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

11.2 The notes of tabular

The package `nicematrix` also provides a command `\tabularnote` which gives the ability to specify notes that will be composed at the end of the array with a width of line equal to the width of the array (excepted the potential exterior columns). With no surprise, that command is available only in the environments without delimiters, that is to say `{NiceTabular}`, `{NiceArray}` and `{NiceMatrix}`. In fact, this command is available only if the extension `enumitem` has been loaded (before or after `nicematrix`). Indeed, the notes are composed at the end of the array with a type of list provided by the package `enumitem`.

```
\begin{NiceTabular}{@{}llr@{}}
[first-row, code-for-first-row = \bfseries]
\toprule
Last name & First name & Birth day \\
\midrule
Achard\tabularnote{Achard is an old family of the Poitou.} \\
& Jacques & 5 juin 1962 \\
Lefebvre\tabularnote{The name Lefebvre is an alteration of the name Lefebure.} \\
& Mathilde & 23 mai 1988 \\
Vanesse & Stephany & 30 octobre 1994 \\
Dupont & Chantal & 15 janvier 1998 \\
\bottomrule
\end{NiceTabular}
```

Last name	First name	Birth day
Achard ^a	Jacques	June 5, 2005
Lefebvre ^b	Mathilde	January 23, 1975
Vanesse	Stephany	October 30, 1994
Dupont	Chantal	January 15, 1998

^a Achard is an old family of the Poitou.

^b The name Lefebvre is an alteration of the name Lefebure.

- If you have several successive commands `\tabularnote{...}` with no space at all between them, the labels of the corresponding notes are composed together, separated by commas (this is similar to the option `multiple` of `footmisc` for the footnotes).
- If a command `\tabularnote{...}` is exactly at the end of a cell (with no space at all after), the label of the note is composed in an overlapping position (towards the right). This structure may provide a better alignment of the cells of a given column.
- If the key `notes/para` is used, the notes are composed at the end of the array in a single paragraph (as with the key `para` of `threeparttable`).
- There is a key `tabularnote` which provides a way to insert some text in the zone of the notes before the numbered tabular notes.
- If the package `booktabs` has been loaded (before or after `nicematrix`), the key `notes/bottomrule` draws a `\bottomrule` of `booktabs` after the notes.
- The command `\tabularnote` may be used before the environment of `nicematrix`. Thus, it's possible to use it on the title inserted by `\caption` in an environment `{table}` of LaTeX.
- It's possible to create a reference to a tabular note created by `\tabularnote` (with the usual command `\label` used after the `\tabularnote`).

For an illustration of some of those remarks, see table 1, p. 25. This table has been composed with the following code.

Table 1: Use of \tabularnote^a

Last name	First name	Length of life
Churchill	Wiston	91
Nightingale ^{b,c}	Florence	90
Schoelcher	Victor	89 ^d
Touchet	Marie	89
Wallis	John	87

Some text before the notes.

^a It's possible to put a note in the caption.

^b Considered as the first nurse of history.

^c Nicknamed "the Lady with the Lamp".

^d The label of the note is overlapping.

```
\begin{table}
\setlength{\belowcaptionskip}{1ex}
\centering
\caption{Use of \texttt{\textbackslash tabularnote} \texttt{\textbackslash tabularnote{It's possible to put a note in the caption.}}}
\label{t:tabularnote}
\begin{NiceTabular}{@{}llc@{}}
[notes/bottomrule, tabularnote = Some text before the notes.]
\toprule
Last name & First name & Length of life \\
\midrule
Churchill & Wiston & 91\\
Nightingale\tabularnote{Considered as the first nurse of history.}\tabularnote{Nicknamed ``the Lady with the Lamp''.}\\
& Florence & 90 \\
Schoelcher & Victor & 89\tabularnote{The label of the note is overlapping.}\\
Touchet & Marie & 89 \\
Wallis & John & 87 \\
\bottomrule
\end{NiceTabular}
\end{table}
```

11.3 Customisation of the tabular notes

The tabular notes can be customized with a set of keys available in \NiceMatrixOptions. The name of these keys is prefixed by `notes`.

- `notes/para`
- `notes/bottomrule`
- `notes/style`
- `notes/label-in-tabular`
- `notes/label-in-list`
- `notes/enumitem-keys`
- `notes/enumitem-keys-para`
- `notes/code-before`

For sake of commodity, it is also possible to set these keys in \NiceMatrixOptions via a key `notes` which takes in as value a list of pairs `key=value` where the name of the keys need no longer be prefixed by `notes`:

```
\NiceMatrixOptions
{
    notes =
    {
        bottomrule ,
        style = ... ,
        label-in-tabular = ... ,
        enumitem-keys =
        {
            labelsep = ... ,
            align = ... ,
            ...
        }
    }
}
```

We detail these keys.

- The key **notes/para** requires the composition of the notes (at the end of the tabular) in a single paragraph.

Initial value: **false**

That key is also available within a given environment.

- The key **notes/bottomrule** adds a `\bottomrule` of `booktabs` *after* the notes. Of course, that rule is drawn only if there is really notes in the tabular. The package `booktabs` must have been loaded (before or after the package `nicematrix`). If it is not, an error is raised.

Initial value: **false**

That key is also available within a given environment.

- The key **notes/style** is a command whose argument is specified by #1 and which gives the style of numerotation of the notes. That style will be used by `\ref` when referencing a tabular note marked with a command `\label`. The labels formatted by that style are used, separated by commas, when the user puts several consecutive commands `\tabularnote`. The marker #1 is meant to be the name of a LaTeX counter.

Initial value: `\textit{\alph{#1}}`

Another possible value should be a mere `\arabic{#1}`

- The key **notes/label-in-tabular** is a command whose argument is specified by #1 which is used when formatting the label of a note in the tabular. Internally, this number of note has already been formatted by **notes/style** before sent to that command.

Initial value: `#1`

In French, it's a tradition of putting a small space before the label of note. That tuning could be achieved by the following code:

```
\NiceMatrixOptions{notes/label-in-tabular = \,\textsuperscript{#1}}
```

- The key **notes/label-in-list** is a command whose argument is specified by #1 which is used when formatting the label in the list of notes at the end of the tabular. Internally, this number of note has already been formatted by **notes/style** before sent to that command.

Initial value: `#1`

In French, the labels of notes are not composed in upper position when composing the notes. Such behaviour could be achieved by:

```
\NiceMatrixOptions{notes/label-in-list = #1.\nobreak\hspace{0.25em}}
```

The command `\nobreak` is for the event that the option **para** is used.

- The notes are composed at the end of the tabular by using internally a style of list of `enumitem`. The key `notes/enumitem-keys` specifies a list of pairs `key=value` (following the specifications of `enumitem`) to customize that type of list.

Initial value: `noitemsep , leftmargin = * , align = left , labelsep = 0pt`

This initial value contains the specification `align = left` which requires a composition of the label leftwards in the box affected to that label. With that tuning, the notes are composed flush left, which is pleasant when composing tabulars in the spirit of `booktabs` (see for example the table 1, p. 25).

- The key `notes/enumitem-keys-para` is similar to the previous one but corresponds to the type of list used when the option `para` is in force. Of course, when the option `para` is used, a list of type `inline` (as called by `enumitem`) is used and the pairs `key=value` should correspond to such a list of type `inline`.

Initial value: `afterlabel = \nobreak , itemjoin = \quad`

- The key `notes/code-before` est une token list inserted by `nicematrix` just before the composition of the notes at the end of the tabular.

Initial value: `empty`

For example, if one wishes to compose all the notes in gray and `\footnotesize`, he should use that key:

```
\NiceMatrixOptions{notes/code-before = \footnotesize \color{gray}}
```

It's also possible to add `\raggedright` or `\RaggedRight` in that key (`\RaggedRight` is a command of `ragged2e`).

For an example of customization of the tabular notes, see p. 36.

11.4 Use of `{NiceTabular}` with `threeparttable`

If you wish to use the environment `{NiceTabular}` or `{NiceTabular*}` in an environment `{threeparttable}` of the eponymous package, you have to patch the environment `{threeparttable}` with the following code (with a version of LaTeX at least 2020/10/01).

```
\makeatletter
\AddToHook{env/threeparttable/begin}
  {\TPT@hookin{NiceTabular}\TPT@hookin{NiceTabular*}}
\makeatother
```

12 Other features

12.1 Use of the column type S of siunitx

If the package `siunitx` is loaded (before or after `nicematrix`), it's possible to use the `S` column type of `siunitx` in the environments of `nicematrix`. The implementation doesn't use explicitly any private macro of `siunitx`.

<pre>\$\begin{pNiceArray}{ScWc{1cm}c}[nullify-dots,first-row] {C_1} & \cdots & C_n \\ 2.3 & 0 & \cdots & 0 \\ 12.4 & \vdots & & \vdots \\ 1.45 & & & \vdots \\ 7.2 & 0 & \cdots & 0 \end{pNiceArray}\$</pre>	$\left(\begin{array}{ccccc} C_1 & \cdots & \cdots & \cdots & C_n \\ 2.3 & 0 & \cdots & \cdots & 0 \\ 12.4 & \vdots & & & \vdots \\ 1.45 & & & & \vdots \\ 7.2 & 0 & \cdots & \cdots & 0 \end{array} \right)$
--	---

On the other hand, the `d` columns of the package `dcolumn` are not supported by `nicematrix`.

12.2 Alignment option in {NiceMatrix}

The environments without preamble (`{NiceMatrix}`, `{pNiceMatrix}`, `{bNiceMatrix}`, etc.) provide two options `l` and `r` which generate all the columns aligned leftwards (or rightwards).

```
$\begin{bNiceMatrix}[r]
\cos x & - \sin x \\
\sin x & \cos x
\end{bNiceMatrix}$
```

$$\begin{bmatrix} \cos x & - \sin x \\ \sin x & \cos x \end{bmatrix}$$

12.3 The command `\rotate`

The package `nicematrix` provides a command `\rotate`. When used in the beginning of a cell, this command composes the contents of the cell after a rotation of 90° in the direct sens.

In the following command, we use that command in the `code-for-first-row`.

```
\NiceMatrixOptions%
{code-for-first-row = \scriptstyle \rotate \text{image of } ,
 code-for-last-col = \scriptstyle }
$A = \begin{pNiceMatrix}[first-row,last-col=4]
e_1 & e_2 & e_3 & \\
1 & 2 & 3 & e_1 \\
4 & 5 & 6 & e_2 \\
7 & 8 & 9 & e_3
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}_{e_1 \ e_2 \ e_3}^{\text{image of } e_1 \ \text{image of } e_2 \ \text{image of } e_3}$$

If the command `\rotate` is used in the “last row” (exterior to the matrix), the corresponding elements are aligned upwards as shown below.

```
\NiceMatrixOptions%
{code-for-last-row = \scriptstyle \rotate ,
 code-for-last-col = \scriptstyle }
$A = \begin{pNiceMatrix}[last-row=4,last-col=4]
1 & 2 & 3 & e_1 \\
4 & 5 & 6 & e_2 \\
7 & 8 & 9 & e_3 \\
\text{image of } e_1 & e_2 & e_3 &
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}_{e_1 \ e_2 \ e_3}^{\text{image of } e_1 \ \text{image of } e_2 \ \text{image of } e_3}$$

12.4 The option `small`

With the option `small`, the environments of the package `nicematrix` are composed in a way similar to the environment `{smallmatrix}` of the package `amsmath` (and the environments `{psmallmatrix}`, `{bsmallmatrix}`, etc. of the package `mathtools`).

```
$\begin{bNiceArray}{cccc|c}[\small,
    last-col,
    code-for-last-col = \scriptscriptstyle,
    columns-width = 3mm ]
1 & -2 & 3 & 4 & 5 \\
0 & 3 & 2 & 1 & 2 \& L_2 \gets 2L_1 - L_2 \\
0 & 1 & 1 & 2 & 3 \& L_3 \gets L_1 + L_3
\end{bNiceArray}$
```

$$\left[\begin{array}{ccccc|c} 1 & -2 & 3 & 4 & 5 \\ 0 & 3 & 2 & 1 & 2 \\ 0 & 1 & 1 & 2 & 3 \end{array} \right]_{L_2 \leftarrow 2L_1 - L_2}^{L_3 \leftarrow L_1 + L_3}$$

One should note that the environment `{NiceMatrix}` with the option `small` is not composed *exactly* as the environment `{smallmatrix}`. Indeed, all the environments of `nicematrix` are constructed upon

`{array}` (of the package `array`) whereas the environment `{smallmatrix}` is constructed directly with an `\halign` of TeX.

In fact, the option `small` corresponds to the following tuning:

- the cells of the array are composed with `\scriptstyle`;
- `\arraystretch` is set to 0.47;
- `\arraycolsep` is set to 1.45 pt;
- the characteristics of the dotted lines are also modified.

12.5 The counters `iRow` and `jCol`

In the cells of the array, it's possible to use the LaTeX counters `iRow` and `jCol` which represent the number of the current row and the number of the current column²¹. Of course, the user must not change the value of these counters which are used internally by `nicematrix`.

In the `code-before` (cf. p. 11) and in the `\CodeAfter` (cf. p. 21), `iRow` represents the total number of rows (excepted the potential exterior rows) and `jCol` represents the total number of columns (excepted the potential exterior columns).

```
$\begin{pNiceMatrix} % don't forget the %
    [first-row,
     first-col,
     code-for-first-row = \mathbf{\alpha{jCol}} ,           & \textbf{a} & \textbf{b} & \textbf{c} & \textbf{d} \\
     code-for-first-col = \mathbf{\arabic{iRow}} ]          & \textbf{1} \left( \begin{matrix} 1 & 2 & 3 & 4 \end{matrix} \right) \\
& & & & \\
& 1 & 2 & 3 & 4 \\
& 5 & 6 & 7 & 8 \\
& 9 & 10 & 11 & 12 \\
\end{pNiceMatrix}$
```

If LaTeX counters called `iRow` and `jCol` are defined in the document by packages other than `nicematrix` (or by the final user), they are shadowed in the environments of `nicematrix`.

The package `nicematrix` also provides commands in order to compose automatically matrices from a general pattern. These commands are `\AutoNiceMatrix`, `\pAutoNiceMatrix`, `\bAutoNiceMatrix`, `\vAutoNiceMatrix`, `\VAutoNiceMatrix` and `\BAutoNiceMatrix`.

These commands take in two mandatory arguments. The first is the format of the matrix, with the syntax $n-p$ where n is the number of rows and p the number of columns. The second argument is the pattern (it's a list of tokens which are inserted in each cell of the constructed matrix, excepted in the cells of the potential exterior rows and columns).

```
$C = \pAutoNiceMatrix{3-3}{C_{\arabic{iRow},\arabic{jCol}}} $
```

$$C = \begin{pmatrix} C_{1,1} & C_{1,2} & C_{1,3} \\ C_{2,1} & C_{2,2} & C_{2,3} \\ C_{3,1} & C_{3,2} & C_{3,3} \end{pmatrix}$$

²¹We recall that the exterior “first row” (if it exists) has the number 0 and that the exterior “first column” (if it exists) has also the number 0.

12.6 The option `light-syntax`

The option `light-syntax` (inspired by the package `spalign`) allows the user to compose the arrays with a lighter syntax, which gives a better legibility of the TeX source.

When this option is used, one should use the semicolon for the end of a row and spaces or tabulations to separate the columns. However, as usual in the TeX world, the spaces after a control sequence are discarded and the elements between curly braces are considered as a whole.

```
$\begin{bNiceMatrix}[\light-syntax,first-row,first-col]
{} a           b           ;           a           b
a 2\cos a     {\cos a + \cos b} ;
b \cos a+\cos b { 2 \cos b }
\end{bNiceMatrix}$
```

$$a \begin{bmatrix} 2 \cos a & \cos a + \cos b \\ \cos a + \cos b & 2 \cos b \end{bmatrix}$$

It's possible to change the character used to mark the end of rows with the option `end-of-row`. As said before, the initial value is a semicolon.

When the option `light-syntax` is used, it is not possible to put verbatim material (for example with the command `\verb!`) in the cells of the array.²²

12.7 Color of the delimiters

For the environments with delimiters (`{pNiceArray}`, `{pNiceMatrix}`, etc.), it's possible to change the color of the delimiters with the key `delimiters-color`.

```
$\begin{bNiceMatrix}[\delimiters-color=red]
1 & 2 \\
3 & 4
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

12.8 The environment `{NiceArrayWithDelims}`

In fact, the environment `{pNiceArray}` and its variants are based upon a more general environment, called `{NiceArrayWithDelims}`. The first two mandatory arguments of this environment are the left and right delimiters used in the construction of the matrix. It's possible to use `{NiceArrayWithDelims}` if we want to use atypical or asymmetrical delimiters.

```
$\begin{NiceArrayWithDelims}{{\downarrow}{\uparrow}}[margin]
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{NiceArrayWithDelims}$
```

$$\begin{array}{|c c c|} \uparrow & & \\ 1 & 2 & 3 \\ \downarrow & & \\ 4 & 5 & 6 \\ \downarrow & & \\ 7 & 8 & 9 \end{array}$$

13 Use of Tikz with nicematrix

13.1 The nodes corresponding to the contents of the cells

The package `nicematrix` creates a PGF/Tikz node for each (non-empty) cell of the considered array. These nodes are used to draw the dotted lines between the cells of the matrix (inter alia).

Caution : By default, no node is created in an empty cell.

However, it's possible to impose the creation of a node with the command `\NotEmpty`.²³

²²The reason is that, when the option `light-syntax` is used, the whole content of the environment is loaded as a TeX argument to be analyzed. The environment doesn't behave in that case as a standard environment of LaTeX which only put TeX commands before and after the content.

²³One should note that, with that command, the cell is considered as non-empty, which has consequences for the continuous dotted lines (cf. p. 16).

The nodes of a document must have distinct names. That's why the names of the nodes created by `nicematrix` contains the number of the current environment. Indeed, the environments of `nicematrix` are numbered by a internal global counter.

In the environment with the number n , the node of the row i and column j has for name `nm-n-i-j`. The command `\NiceMatrixLastEnv` provides the number of the last environment of `nicematrix` (for LaTeX, it's a “fully expandable” command and not a counter).

However, it's advisable to use instead the key `name`. This key gives a name to the current environment. When the environment has a name, the nodes are accessible with the name “`name-i-j`” where `name` is the name given to the array and i and j the numbers of row and column. It's possible to use these nodes with PGF but the final user will probably prefer to use Tikz (which is a convenient layer upon PGF). However, one should remind that `nicematrix` doesn't load Tikz by default. In the following examples, we assume that Tikz has been loaded.

```
$\begin{pNiceMatrix}[name=mymatrix]
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{pNiceMatrix}$
\tikz[remember picture,overlay]
\draw (mymatrix-2-2) circle (2mm) ;
```

$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & \textcircled{5} & 6 \\ 7 & 8 & 9 \end{pmatrix}$$

Don't forget the options `remember picture` and `overlay`.

In the `\CodeAfter`, the things are easier : one must refer to the nodes with the form $i-j$ (we don't have to indicate the environment which is of course the current environment).

```
$\begin{pNiceMatrix}
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\CodeAfter
\tikz \draw (2-2) circle (2mm) ;
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & \textcircled{5} & 6 \\ 7 & 8 & 9 \end{pmatrix}$$

In the following example, we have underlined all the nodes of the matrix (we explain below the technic used : cf. p. 41).

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

13.2 The “medium nodes” and the “large nodes”

In fact, the package `nicematrix` can create “extra nodes”: the “medium nodes” and the “large nodes”. The first ones are created with the option `create-medium-nodes` and the second ones with the option `create-large-nodes`.²⁴

These nodes are not used by `nicematrix` by default, and that's why they are not created by default.

The names of the “medium nodes” are constructed by adding the suffix “`-medium`” to the names of the “normal nodes”. In the following example, we have underlined the “medium nodes”. We consider that this example is self-explanatory.

$$\begin{pmatrix} a & a+b & a+b+c \\ \underline{a} & \underline{a} & \underline{a+b} \\ a & a & a \end{pmatrix}$$

The names of the “large nodes” are constructed by adding the suffix “`-large`” to the names of the “normal nodes”. In the following example, we have underlined the “large nodes”. We consider that this example is self-explanatory.²⁵

²⁴There is also an option `create-extra-nodes` which is an alias for the conjunction of `create-medium-nodes` and `create-large-nodes`.

²⁵There is no “large nodes” created in the exterior rows and columns (for these rows and columns, cf. p. 15).

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

The “large nodes” of the first column and last column may appear too small for some usage. That’s why it’s possible to use the options `left-margin` and `right-margin` to add space on both sides of the array and also space in the “large nodes” of the first column and last column. In the following example, we have used the options `left-margin` and `right-margin`.²⁶

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

It’s also possible to add more space on both side of the array with the options `extra-left-margin` and `extra-right-margin`. These margins are not incorporated in the “large nodes”. It’s possible to fix both values with the option `extra-margin` and, in the following example, we use `extra-margin` with the value 3 pt.

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

Be careful : These nodes are reconstructed from the contents of the contents cells of the array. Usually, they do not correspond to the cells delimited by the rules (if we consider that these rules are drawn).

Here is an array composed with the following code:

```
\large
\begin{NiceTabular}{wl{2cm}ll}[hvlines]
fraise & amande & abricot \\
prune & pêche & poire \\
noix & noisette & brugnon
\end{NiceTabular}
```

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

Here, we have colored all the cells of the array with `\chessboardcolors`.

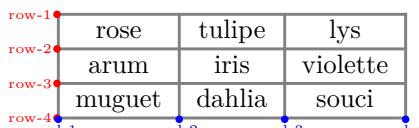

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

Here are the “large nodes” of this array (without use of `margin` nor `extra-margin`).

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

13.3 The “row-nodes” and the “col-nodes”

The package `nicematrix` creates a PGF/Tikz node indicating the potential position of each horizontal rule (with the names `row-i`) and each vertical rule (with the names `col-j`), as described in the following figure. These nodes are available in the `code-before` and the `\CodeAfter`.

²⁶The options `left-margin` and `right-margin` take dimensions as values but, if no value is given, the default value is used, which is `\arraycolsep` (by default: 5 pt). There is also an option `margin` to fix both `left-margin` and `right-margin` to the same value.

If we use Tikz (we remind that `nicematrix` does not load Tikz by default), we can access (in the `code-before` and the `\CodeAfter`) to the intersection of the horizontal rule i and the vertical rule j with the syntax `(row- i -|col- j)`.

```
\begin{NiceMatrix}[  
    code-before =  
    {  
        \tikz \draw [fill = red!15]  
            (row-7-|col-4) -- (row-8-|col-4) -- (row-8-|col-5) --  
            (row-9-|col-5) -- (row-9-|col-6) |- cycle ;  
    }  
]  
1 \\  
1 & 1 \\  
1 & 2 & 1 \\  
1 & 3 & 3 & 1 \\  
1 & 4 & 6 & 4 & 1 \\  
1 & 5 & 10 & 10 & 5 & 1 \\  
1 & 6 & 15 & 20 & 15 & 6 & 1 \\  
1 & 7 & 21 & 35 & 35 & 21 & 7 & 1 \\  
1 & 8 & 28 & 56 & 70 & 56 & 28 & 8 & 1  
\end{NiceMatrix}]  
  
1  
1 1  
1 2 1  
1 3 3 1  
1 4 6 4 1  
1 5 10 10 5 1  
1 6 15 20 15 6 1  
1 7 21 35 35 21 7 1  
1 8 28 56 70 56 28 8 1
```

13.4 The nodes corresponding to the command `\SubMatrix`

The command `\SubMatrix` available in the `\CodeAfter` has been described p. 22.

If a command `\SubMatrix` has been used with the key `name` with an expression such as `name=MyName` three PGF/Tikz nodes are created with the names `MyName-left`, `MyName` and `MyName-right`.

The nodes `MyName-left` and `MyName-right` correspond to the delimiters left and right and the node `MyName` correspond to the submatrix itself.

In the following example, we have highlighted these nodes (the submatrix itself has been created with `\SubMatrix\{{2-2}\}{3-3}\}`).

$$\begin{pmatrix} 121 & 23 & 345 & 345 \\ 45 & \left\{ \begin{array}{cc} 346 & 863 \end{array} \right\} 444 \\ 3462 & \left\{ \begin{array}{c} 38458 \\ 34 \end{array} \right\} 294 \\ 34 & 7 & 78 & 309 \end{pmatrix}$$

14 API for the developpers

The package `nicematrix` provides two variables which are internal but public²⁷:

- `\g_nicematrix_code_before_t1`;

²⁷According to the LaTeX3 conventions, each variable with name beginning with `\g_nicematrix` ou `\l_nicematrix` is public and each variable with name beginning with `\g_nicematrix` or `\l_nicematrix` is private.

- `\g_nicematrix_code_after_tl`.

These variables contain the code of what we have called the “code-before” and the “code-after”. The developer can use them to add code from a cell of the array (the affectation must be global, allowing to exit the cell, which is a TeX group).

One should remark that the use of `\g_nicematrix_code_before_tl` needs one compilation more (because the instructions are written on the aux file to be used during the next run).

Example : We want to write a command `\hatchcell` to hatch the current cell (with an optional argument between brackets for the color). It’s possible to program such command `\hatchcell` as follows, explicitly using the public variable `\g_nicematrix_code_before_tl` (this code requires the Tikz library patterns: `\usetikzlibrary{patterns}`).

```
ExplSyntaxOn
\cs_new_protected:Nn \__pantigny_hatchcell:nnn
{
    \begin{tikzpicture}
        \fill [ pattern = north-west-lines , pattern~color = #3 ]
            ( row - #1 - | col - #2 )
            rectangle
            ( row - \int_eval:n { #1 + 1 } -| col - \int_eval:n { #2 + 1 } );
    \end{tikzpicture}
}

\NewDocumentCommand \hatchcell { ! O { black } }
{
    \tl_gput_right:Nx \g_nicematrix_code_before_tl
    {
        \__pantigny_hatchcell:nnn
        { \int_use:c { c@iRow } }
        { \int_use:c { c@jCol } }
        { #1 }
    }
}
ExplSyntaxOff
```

Here is an example of use:

```
\begin{NiceTabular}{ccc}[hvlines]
Tokyo & Paris & London \\
Roma & \hatchcell[blue!30]{Oslo} & Miami \\
Los Angeles & Madrid & Roma
\end{NiceTabular}
```

Tokyo	Paris	London
Lima	 Oslo	Miami
Los Angeles	Madrid	Roma

15 Technical remarks

15.1 Definition of new column types

The package `nicematrix` provides the command `\OnlyMainNiceMatrix` which is meant to be used in definitions of new column types. Its argument is evaluated if and only if we are in the main part of the array, that is to say not in an potential exterior row.

For example, one may wish to define a new column type `?` in order to draw a (black) heavy rule of width 1 pt. The following definition will do the job²⁸:

```
\newcolumntype{?}{!{\OnlyMainNiceMatrix{\vrule width 1 pt}}}
```

²⁸The command `\vrule` is a TeX (and not LaTeX) command.

The heavy vertical rule won't extend in the exterior rows.²⁹

```
$\begin{pNiceArray}{cc?cc}[first-row,last-row=3]
C_1 & C_2 & C_3 & C_4 \\
a & b & c & d \\
e & f & g & h \\
C_1 & C_2 & C_3 & C_4
\end{pNiceArray}$
```

$$\left(\begin{array}{cccc|cc} C_1 & C_2 & C_3 & C_4 \\ a & b & c & d \\ e & f & g & h \\ C_1 & C_2 & C_3 & C_4 \end{array} \right)$$

This specifier ? may be used in the standard environments `{tabular}` and `{array}` (of the package `array`) and, in this case, the command `\OnlyMainNiceMatrix` is no-op.

15.2 Diagonal lines

By default, all the diagonal lines³⁰ of a same array are “parallelized”. That means that the first diagonal line is drawn and, then, the other lines are drawn parallel to the first one (by rotation around the left-most extremity of the line). That's why the position of the instructions `\Ddots` in the array can have a marked effect on the final result.

In the following examples, the first `\Ddots` instruction is written in color:

Example with parallelization (default):

```
$A = \begin{pNiceMatrix}
1 & \cdots & & & \\
& a+b & \textcolor{blue}{\Ddots} & & \\
& \vdots & \ddots & & \\
a+b & & & \cdots & \\
& \cdots & & a+b & 1
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & \cdots & & & 1 \\ \vdots & \ddots & & & \vdots \\ a+b & \cdots & \cdots & \cdots & \vdots \\ a+b & \cdots & a+b & \cdots & 1 \end{pmatrix}$$

```
$A = \begin{pNiceMatrix}
1 & \cdots & & & \\
& a+b & \cdots & & \\
& \vdots & \textcolor{blue}{\Ddots} & \textcolor{blue}{\Ddots} & \\
a+b & & \cdots & a+b & 1
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & \cdots & & & 1 \\ \vdots & \ddots & & & \vdots \\ a+b & \cdots & \cdots & \cdots & \vdots \\ a+b & \cdots & a+b & \cdots & 1 \end{pmatrix}$$

It's possible to turn off the parallelization with the option `parallelize-diags` set to `false`:

The same example without parallelization:

$$A = \begin{pmatrix} 1 & \cdots & & & 1 \\ a+b & \cdots & \cdots & \cdots & \vdots \\ a+b & \cdots & a+b & \cdots & 1 \end{pmatrix}$$

It's possible to specify the instruction `\Ddots` which will be drawn first (and which will be used to draw the other diagonal dotted lines when the parallelization is in force) with the key `draw-first: \Ddots[draw-first]`.

15.3 The “empty” cells

An instruction like `\Ldots`, `\Cdots`, etc. tries to determine the first non-empty cell on both sides. However, an “empty cell” is not necessarily a cell with no TeX content (that is to say a cell with no token between the two ampersands `&`). The precise rules are as follow.

- An implicit cell is empty. For example, in the following matrix:

²⁹Of course, such rule is defined by the classical technics of `nicematrix` and, for this reason, won't cross the double rules of `\hline\hline`.

³⁰We speak of the lines created by `\Ddots` and not the lines created by a command `\line` in `code-after`.

```
\begin{pmatrix}
a & b \\
c \\
\end{pmatrix}
```

the last cell (second row and second column) is empty.

- Each cell whose TeX output has a width equal to zero is empty.
- A cell containing the command `\NotEmpty` is not empty (and a PGF/Tikz node) is created in that cell.
- A cell with a command `\Hspace` (or `\Hspace*`) is empty. This command `\Hspace` is a command defined by the package `nicematrix` with the same meaning as `\hspace` except that the cell where it is used is considered as empty. This command can be used to fix the width of some columns of the matrix without interfering with `nicematrix`.

15.4 The option `exterior-arraycolsep`

The environment `{array}` inserts an horizontal space equal to `\arraycolsep` before and after each column. In particular, there is a space equal to `\arraycolsep` before and after the array. This feature of the environment `{array}` was probably not a good idea³¹. The environment `{matrix}` of `amsmath` and its variants (`{pmatrix}`, `{vmatrix}`, etc.) of `amsmath` prefer to delete these spaces with explicit instructions `\hskip -\arraycolsep`³². The package `nicematrix` does the same in all its environments, `{NiceArray}` included. However, if the user wants the environment `{NiceArray}` behaving by default like the environment `{array}` of `array` (for example, when adapting an existing document) it's possible to control this behaviour with the option `exterior-arraycolsep`, set by the command `\NiceMatrixOptions`. With this option, exterior spaces of length `\arraycolsep` will be inserted in the environments `{NiceArray}` (the other environments of `nicematrix` are not affected).

15.5 Incompatibilities

The package `nicematrix` is not fully compatible with the package `arydshln` (because this package redefines many internal of `array`).

Anyway, in order to use `arydshln`, one must first free the letter ":" by giving a new letter for the vertical dotted rules of `nicematrix`:

```
\NiceMatrixOptions{letter-for-dotted-lines=;}
```

As of now, the package `nicematrix` is not compatible with `aastex63`. If you want to use `nicematrix` with `aastex63`, send me an email and I will try to solve the incompatibilities.

16 Examples

16.1 Notes in the tabulars

The tools provided by `nicematrix` for the composition of the tabular notes have been presented in the section 11 p. 23.

³¹In the documentation of `{amsmath}`, we can read: *The extra space of `\arraycolsep` that `array` adds on each side is a waste so we remove it [in `{matrix}`] (perhaps we should instead remove it from `array` in general, but that's a harder task).*

³²And not by inserting `\{ \}` on both sides of the preamble of the array. As a consequence, the length of the `\hline` is not modified and may appear too long, in particular when using square brackets

Let's consider that we wish to number the notes of a tabular with stars.³³

First, we write a command `\stars` similar the well-known commands `\arabic`, `\alph`, `\Alpha`, etc. which produces a number of stars equal to its argument³⁴

```
\ExplSyntaxOn
\NewDocumentCommand \stars { m }
  { \prg_replicate:nn { \value{#1} } { $ \star $ } }
\ExplSyntaxOff
```

Of course, we change the style of the labels with the key `notes/style`. However, it would be interesting to change also some parameters in the type of list used to compose the notes at the end of the tabular. First, we required a composition flush right for the labels with the setting `align=right`. Moreover, we want the labels to be composed on a width equal to the width of the widest label. The widest label is, of course, the label with the greatest number of stars. We know that number: it is equal to `\value{tabularnote}` (because `tabularnote` is the LaTeX counter used by `\tabularnote` and, therefore, at the end of the tabular, its value is equal to the total number of tabular notes). We use the key `widest*` of `enumitem` in order to require a width equal to that value: `widest*=\value{tabularnote}`.

```
\NiceMatrixOptions
{
  notes =
  {
    style = \stars{#1} ,
    enumitem-keys =
    {
      widest* = \value{tabularnote} ,
      align = right
    }
  }
}

\begin{NiceTabular}{llr}[first-row,code-for-first-row = \bfseries]
\toprule
Last name & First name & Birth day \\
\midrule
Achard\tabularnote{Achard is an old family of the Poitou.} \\
& Jacques & 5 juin 1962 \\
Lefebvre\tabularnote{The name Lefebvre is an alteration of the name Lefebure.} \\
& Mathilde & 23 mai 1988 \\
Vanesse & Stephany & 30 octobre 1994 \\
Dupont & Chantal & 15 janvier 1998 \\
\bottomrule
\end{NiceTabular}
```

Last name	First name	Birth day
Achard*	Jacques	June 5, 2005
Lefebvre**	Mathilde	January 23, 1975
Vanesse	Stephany	October 30, 1994
Dupont	Chantal	January 15, 1998

*Achard is an old family of the Poitou.

**The name Lefebvre is an alteration of the name Lefebure.

³³Of course, it's realistic only when there is very few notes in the tabular.

³⁴In fact: the value of its argument.

16.2 Dotted lines

A permutation matrix (as an example, we have raised the value of `xdots/shorten`).

```
$\begin{pNiceMatrix} [xdots/shorten=0.6em]
0 & 1 & 0 & & \Cdots & 0 & \\
\Vdots & & & \Ddots & & \Vdots & \\
& & & \Ddots & & & \\
& & & \Ddots & & 0 & \\
0 & & 0 & & & 1 & \\
1 & & 0 & & \Cdots & 0 & \\
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 0 & 1 & 0 & \cdots & 0 \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ 0 & 0 & 1 & \cdots & 0 \\ 1 & 0 & \cdots & \cdots & 0 \end{pmatrix}$$

An example with `\Iddots` (we have raised again the value of `xdots/shorten`).

```
$\begin{pNiceMatrix} [xdots/shorten=0.9em]
1 & \Cdots & 1 & \\
\Vdots & & 0 & \\
& \Iddots & \Iddots & \Vdots & \\
1 & 0 & \Cdots & 0 & \\
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & \cdots & 1 \\ \vdots & & 0 \\ 1 & 0 & \cdots & 0 \end{pmatrix}$$

An example with `\multicolumn`:

```
\begin{BNiceMatrix} [nullify-dots]
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\
\Cdots & & \multicolumn{6}{c}{\text{ other rows }} & \Cdots \\
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\
\end{BNiceMatrix}
```

$$\left\{ \begin{array}{cccccccccc} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\ \cdots & \cdots \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \end{array} \right\}$$

An example with `\Hdotsfor`:

```
\begin{pNiceMatrix} [nullify-dots]
0 & 1 & 1 & 1 & 1 & 0 \\
0 & 1 & 1 & 1 & 1 & 0 \\
\Vdots & & \Hdotsfor{4} & \Vdots & \\
& \Hdotsfor{4} & & \\
& \Hdotsfor{4} & & \\
& \Hdotsfor{4} & & \\
0 & 1 & 1 & 1 & 1 & 0 \\
\end{pNiceMatrix}
```

$$\begin{pmatrix} 0 & 1 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 1 & 0 \\ \vdots & \cdots & \cdots & \cdots & \cdots & \vdots \\ 0 & 1 & 1 & 1 & 1 & 0 \end{pmatrix}$$

An example for the resultant of two polynomials:

```
\setlength{\extrarowheight}{1mm}
\begin{vNiceArray}{cccc:ccc}[columns-width=6mm]
a_0 & & & b_0 & & & \\
a_1 & \&\Ddots & & b_1 & \&\Ddots & \\
\vdots & \&\Ddots & & \vdots & \&\Ddots & b_0 \\
a_p & \&&a_0 & & & b_1 \\
& \&\Ddots & \&a_1 & \&b_q & \&\Vdots \\
& \&&\Vdots & \& \&\Ddots & \\
& \&&a_p & \& \&b_q
\end{vNiceArray}]
```

$$\left| \begin{array}{ccccc} a_0 & & & & \\ a_1 & & & & \\ \vdots & & & & \\ a_p & & & & \\ & & & a_0 & \\ & & & a_1 & \\ & & & \vdots & \\ & & & a_p & \\ & & & & b_0 \\ & & & & b_1 \\ & & & & \vdots \\ & & & & b_q \\ & & & & \\ & & & & \end{array} \right|$$

An example for a linear system:

```
$\begin{pNiceArray}{*6c|c}[nullify-dots,last-col,code-for-last-col=\scriptstyle]
1 & 1 & 1 & \cdots & 1 & 0 \\
0 & 1 & 0 & \cdots & 0 & L_2 \gets L_2 - L_1 \\
0 & 0 & 1 & \&\Ddots & \&\Vdots & L_3 \gets L_3 - L_1 \\
& & & \&\Ddots & \&\Vdots & \&\Vdots \\
\vdots & & & \&\Ddots & & 0 \\
0 & & & \&\Cdots & 0 & L_n \gets L_n - L_1 \\
0 & & & & 1 & 0
\end{pNiceArray}$
```

$$\left(\begin{array}{cccc|c} 1 & 1 & 1 & \cdots & 1 & 0 \\ 0 & 1 & 0 & \cdots & 0 & \vdots \\ 0 & 0 & 1 & \ddots & \vdots & \\ \vdots & & & \ddots & & \\ 0 & \cdots & 0 & 1 & 0 & 0 \end{array} \right) \begin{array}{l} L_2 \leftarrow L_2 - L_1 \\ L_3 \leftarrow L_3 - L_1 \\ \vdots \\ L_n \leftarrow L_n - L_1 \end{array}$$

16.3 Dotted lines which are no longer dotted

The option `line-style` controls the style of the lines drawn by `\Ldots`, `\Cdots`, etc. Thus, it's possible with these commands to draw lines which are not longer dotted.

```
\NiceMatrixOptions
{nullify-dots,code-for-first-col = \color{blue},code-for-first-col=\color{blue}}
$\begin{pNiceMatrix}[first-row,first-col]
& \& \Ldots[\text{line-style}=\{\text{solid},\text{--}\},\text{shorten=0pt}]^{\text{n}} \text{ \text{columns}}} \\
& 1 & 1 & \& \Ldots & 1 \\
& 1 & 1 & \& 1 &
\end{pNiceMatrix}$
```

```
\Vdots[line-style={solid,<->}]_n \text{ rows} \} & 1 & 1 & 1 & & 1 \\
& 1 & 1 & 1 & & 1 \\
& 1 & 1 & 1 & \Ldots & 1
\end{pNiceMatrix}
```

$$\begin{pmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & 1 & 1 & & 1 \\ 1 & 1 & 1 & & 1 \\ 1 & 1 & 1 & & 1 \\ 1 & 1 & 1 & \dots & 1 \end{pmatrix}$$

n columns
n rows

16.4 Width of the columns

In the following example, we use `{NiceMatrixBlock}` with the option `auto-columns-width` because we want the same automatic width for all the columns of the matrices.

```
\begin{NiceMatrixBlock}[auto-columns-width]
\niceMatrixOptions
{ last-col,code-for-last-col = \color{blue}\scriptstyle\text{light-syntax}}
\setlength{\extrarowheight}{1mm}
$\begin{pNiceArray}{cccc:c}
1 & 1 & 1 & 1 & 1 {} ;
2 & 4 & 8 & 16 & 9 ;
3 & 9 & 27 & 81 & 36 ;
4 & 16 & 64 & 256 & 100
\end{pNiceArray}$
\medskip
$\begin{pNiceArray}{cccc:c}
1 & 1 & 1 & 1 & 1 ;
0 & 2 & 6 & 14 & 7 & \{ L_2 \gets -2 L_1 + L_2 \} ;
0 & 6 & 24 & 78 & 33 & \{ L_3 \gets -3 L_1 + L_3 \} ;
0 & 12 & 60 & 252 & 96 & \{ L_4 \gets -4 L_1 + L_4 \}
\end{pNiceArray}$
\medskip
...
\end{NiceMatrixBlock}
```

$$\begin{array}{c|ccccc}
\left(\begin{array}{ccccc} 1 & 1 & 1 & 1 & 1 \\ 2 & 4 & 8 & 16 & 9 \\ 3 & 9 & 27 & 81 & 36 \\ 4 & 16 & 64 & 256 & 100 \end{array} \right) & & \left(\begin{array}{ccccc} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 3 & 18 & 6 \\ 0 & 0 & -2 & -14 & -\frac{9}{2} \end{array} \right) & & L_3 \leftarrow -3L_2 + L_3 \\
& & \left(\begin{array}{ccccc} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 1 & 6 & 2 \\ 0 & 0 & -2 & -14 & -\frac{9}{2} \end{array} \right) & & L_4 \leftarrow L_2 - L_4 \\
\left(\begin{array}{ccccc} 1 & 1 & 1 & 1 & 1 \\ 0 & 2 & 6 & 14 & 7 & \{ L_2 \leftarrow -2L_1 + L_2 \} \\ 0 & 6 & 24 & 78 & 33 & \{ L_3 \leftarrow -3L_1 + L_3 \} \\ 0 & 12 & 60 & 252 & 96 & \{ L_4 \leftarrow -4L_1 + L_4 \} \end{array} \right) & & \left(\begin{array}{ccccc} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 1 & 6 & 2 \\ 0 & 0 & -2 & -14 & -\frac{9}{2} \end{array} \right) & & L_3 \leftarrow \frac{1}{3}L_3 \\
& & \left(\begin{array}{ccccc} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 1 & 6 & 2 \\ 0 & 0 & 0 & -2 & -\frac{1}{2} \end{array} \right) & & L_4 \leftarrow L_3 + L_4
\end{array}$$

16.5 How to highlight cells of a matrix

In order to highlight a cell of a matrix, it's possible to “draw” that cell with the key `draw` of the command `\Block` (this is one of the uses of a mono-cell block³⁵).

```
$\begin{pNiceArray}{>{\strut}cccc}[margin, rules/color=blue]
\Block[draw]{}{a_{11}} & a_{12} & a_{13} & a_{14} \\
a_{21} & \Block[draw]{}{a_{22}} & a_{23} & a_{24} \\
a_{31} & a_{32} & \Block[draw]{}{a_{33}} & a_{34} \\
a_{41} & a_{42} & a_{43} & \Block[draw]{}{a_{44}}
\end{pNiceArray}$
```

$$\left(\begin{array}{cccc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & \boxed{a_{22}} & a_{23} & a_{24} \\ a_{31} & a_{32} & \boxed{a_{33}} & a_{34} \\ a_{41} & a_{42} & a_{43} & \boxed{a_{44}} \end{array} \right)$$

We should remark that the rules we have drawn are drawn *after* the construction of the array and thus, they don't spread the cells of the array. We recall that, on the other side, the command `\hline`, the specifier “|” and the options `hlines`, `vlines` and `hvlines` spread the cells.³⁶

It's possible to color a row with `\rowcolor` in the `code-before` (or with `\rowcolor` in the first cell of the row if the key `colortbl-like` is used). However, it's not possible to do a fine tuning. That's why we describe now a method to highlight a row of the matrix. We create a rectangular Tikz node which encompasses the nodes of the second row with the Tikz library `fit`. This Tikz node is filled after the construction of the matrix. In order to see the text *under* this node, we have to use transparency with the `blend mode` equal to `multiply`.

That example and the following ones require Tikz (by default, `nicematrix` only loads PGF) and the Tikz library `fit`. The following lines in the preamble of your document do the job:

```
\usepackage{tikz}
\usetikzlibrary{fit}

\tikzset{highlight/.style={rectangle,
    fill=red!15,
    blend mode = multiply,
    rounded corners = 0.5 mm,
    inner sep=1pt,
    fit = #1}}
```

```
$\begin{bNiceMatrix}
0 & \cdots & 0 \\
1 & \cdots & 1 \\
0 & \cdots & 0 \\
\CodeAfter \tikz \node [highlight = (2-1) (2-3)] {} ;
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 0 & \cdots & 0 \\ 1 & \cdots & 1 \\ 0 & \cdots & 0 \end{bmatrix}$$

We recall that, for a rectangle of merged cells (with the command `\Block`), a Tikz node is created for the set of merged cells with the name *i-j-block* where *i* and *j* are the number of the row and

³⁵We recall that, if the first mandatory argument of the command `\Block` is left empty, that means that the block is a mono-cell block

³⁶For the command `\cline`, see the remark p. 7.

the number of the column of the upper left cell (where the command `\Block` has been issued). If the user has required the creation of the `medium` nodes, a node of this type is also created with a name suffixed by `-medium`.

```
$\begin{pNiceMatrix} [margin,create-medium-nodes]
\Block{3-3}<\Large>{A} & & & 0 \\
& \hspace*{1cm} & & \Vdots \\
& & 0 \\
0 & \Cdots & 0 & 0
\CodeAfter
\tikz \node [highlight = (1-1-block-medium)] {} ;
\end{pNiceMatrix}$
```

$$\begin{pmatrix} A & 0 \\ \vdots & 0 \\ 0 & \cdots & 0 & 0 \end{pmatrix}$$

Consider now the following matrix which we have named `example`.

```
$\begin{pNiceArray}{ccc} [name=example, last-col, create-medium-nodes]
a & a + b & a + b + c & L_1 \\
a & a & a + b & L_2 \\
a & a & a & L_3
\end{pNiceArray}$
```

$$\begin{pmatrix} a & a + b & a + b + c \\ a & a & a + b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

If we want to highlight each row of this matrix, we can use the previous technique three times.

```
\tikzset{mes-options/.style={remember picture,
    overlay,
    name prefix = exemple-,
    highlight/.style = {fill = red!15,
        blend mode = multiply,
        inner sep = 0pt,
        fit = #1}}}

\begin{tikzpicture}[mes-options]
\node [highlight = (1-1) (1-3)] {} ;
\node [highlight = (2-1) (2-3)] {} ;
\node [highlight = (3-1) (3-3)] {} ;
\end{tikzpicture}
```

We obtain the following matrix.

$$\begin{pmatrix} a & a + b & a + b + c \\ \textcolor{red}{a} & a & a + b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

The result may seem disappointing. We can improve it by using the “medium nodes” instead of the “normal nodes”.

```
\begin{tikzpicture}[mes-options, name suffix = -medium]
\node [highlight = (1-1) (1-3)] {} ;
\node [highlight = (2-1) (2-3)] {} ;
\node [highlight = (3-1) (3-3)] {} ;
\end{tikzpicture}
```

We obtain the following matrix.

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

In the following example, we use the “large nodes” to highlight a zone of the matrix.

```
\begin{pNiceArray}{>{\strut}cccc}[create-large-nodes,margin,extra-margin=2pt]
A_{11} & A_{12} & A_{13} & A_{14} \\
A_{21} & A_{22} & A_{23} & A_{24} \\
A_{31} & A_{32} & A_{33} & A_{34} \\
A_{41} & A_{42} & A_{43} & A_{44}
\CodeAfter
\tikz \path [name suffix = -large,fill = red!15, blend mode = multiply]
    (1-1.north west)
    |- (2-2.north west)
    |- (3-3.north west)
    |- (4-4.north west)
    |- (4-4.south east)
    |- (1-1.north west) ;
\end{pNiceArray}
```

$$\begin{pmatrix} A_{11} & A_{12} & A_{13} & A_{14} \\ A_{21} & A_{22} & A_{23} & A_{24} \\ A_{31} & A_{32} & A_{33} & A_{34} \\ A_{41} & A_{42} & A_{43} & A_{44} \end{pmatrix}$$

16.6 Direct use of the Tikz nodes

In the following example, we illustrate the mathematical product of two matrices.

The use of `{NiceMatrixBlock}` with the option `auto-columns-width` gives the same width for all the columns and, therefore, a perfect alignment of the two superposed matrices.

```
\begin{NiceMatrixBlock}[auto-columns-width]
```

```
\NiceMatrixOptions{nullify-dots}
```

The three matrices will be displayed using an environment `{array}` (an environment `{tabular}` may also be possible).

```
$\begin{array}{cc}
& \\
& \\
\end{array}
```

The matrix B has a “first row” (for C_j) and that’s why we use the key `first-row`.

```
\begin{bNiceArray}{c>{\strut}ccc}[name=B,first-row]
& & \\
& C_j & \\
b_{11} & \cdots & b_{1j} & \cdots & b_{1n} \\
\vdots & & \vdots & & \vdots \\
& & b_{kj} & & \\
& & \vdots & & \\
b_{n1} & \cdots & b_{nj} & \cdots & b_{nn}
\end{bNiceArray}
```

The matrix A has a “first column” (for L_i) and that’s why we use the key `first-col`.

```

\begin{bNiceArray}{cc>{\strut}ccc}[name=A,first-col]
& a_{11} & \cdots & & a_{1n} \\
& \vdots & & & \vdots \\
L_i & a_{i1} & \cdots & a_{ik} & \cdots & a_{in} \\
& \vdots & & & & \vdots \\
& a_{n1} & \cdots & a_{nn} & & a_{nn}
\end{bNiceArray}
&

```

In the matrix product, the two dotted lines have an open extremity.

```

\begin{bNiceArray}{cc>{\strut}ccc}
& & & & \\
& & \vdots & & \\
\cdots & & c_{ij} & & \\
\\
\\
\end{bNiceArray}
\end{array}$

```

\end{NiceMatrixBlock}

```

\begin{tikzpicture}[remember picture, overlay]
\node [highlight = (A-3-1) (A-3-5) ] {};
\node [highlight = (B-1-3) (B-5-3) ] {};
\draw [color = gray] (A-3-3) to [bend left] (B-3-3) ;
\end{tikzpicture}

```

$$L_i \begin{bmatrix} a_{i1} & \cdots & a_{ik} & \cdots & a_{in} \\ \vdots & & & & \vdots \\ a_{n1} & \cdots & \cdots & \cdots & a_{nn} \end{bmatrix} \begin{bmatrix} & & & & \\ & \vdots & & & \\ & \cdots & c_{ij} & \cdots & \\ & & \vdots & & \\ & & \cdots & \cdots & \end{bmatrix} C_j \begin{bmatrix} b_{11} & \cdots & b_{1j} & \cdots & b_{1n} \\ \vdots & & \vdots & & \vdots \\ b_{n1} & \cdots & b_{nj} & \cdots & b_{nn} \end{bmatrix}$$

17 Implementation

By default, the package `nicematrix` doesn't patch any existing code.

However, when the option `renew-dots` is used, the commands `\cdots`, `\ldots`, `\dots`, `\vdots`, `\ddots` and `\iddots` are redefined in the environments provided by `nicematrix` as explained previously. In the same way, if the option `renew-matrix` is used, the environment `{matrix}` of `amsmath` is redefined.

On the other hand, the environment `{array}` is never redefined.

Of course, the package `nicematrix` uses the features of the package `array`. It tries to be independent of its implementation. Unfortunately, it was not possible to be strictly independent: the package `nicematrix` relies upon the fact that the package `{array}` uses `\ialign` to begin the `\halign`.

Declaration of the package and packages loaded

The prefix `nicematrix` has been registered for this package.

See: <http://mirrors.ctan.org/macros/latex/contrib/13kernel/13prefixes.pdf>
<@=@=nicematrix>

First, we load `pgfcore` and the module `shapes`. We do so because it's not possible to use `\usepgfmodule` in `\ExplSyntaxOn`.

```
1 \RequirePackage{pgfcore}
2 \usepgfmodule{shapes}
```

We give the traditional declaration of a package written with `expl3`:

```
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
5   {nicematrix}
6   {myfiledate}
7   {\myfileversion}
8   {Enhanced arrays with the help of PGF/TikZ}
```

The command for the treatment of the options of `\usepackage` is at the end of this package for technical reasons.

We load some packages.

```
9 \RequirePackage { array }
10 \RequirePackage { amsmath }

11 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { nicematrix } }
12 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { nicematrix } }
13 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { nicematrix } }
14 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { nicematrix } }
15 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { nicematrix } }
16 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { nicematrix } }
17 \cs_new_protected:Npn \@@_msg_new:nnn { \msg_new:nnnn { nicematrix } }

18 \cs_new_protected:Npn \@@_msg_redirect_name:nn
19   { \msg_redirect_name:nnn { nicematrix } }
```

Technical definitions

```
20 \bool_new:N \c_@@_in_preamble_bool
21 \bool_set_true:N \c_@@_in_preamble_bool
22 \AtBeginDocument { \bool_set_false:N \c_@@_in_preamble_bool }

23 \bool_new:N \c_@@_arydshln_loaded_bool
24 \bool_new:N \c_@@_booktabs_loaded_bool

30     { \bool_set_true:N \c_@@_arydshln_loaded_bool }
31   { }
32   \ifpackageloaded { booktabs }
33     { \bool_set_true:N \c_@@_booktabs_loaded_bool }
34   { }
35   \ifpackageloaded { enumitem }
36     { \bool_set_true:N \c_@@_enumitem_loaded_bool }
37   { }
38   \ifpackageloaded { tikz }
39     { }
```

In some constructions, we will have to use a `{pgfpicture}` which *must* be replaced by a `{tikzpicture}` if Tikz is loaded. However, this switch between `{pgfpicture}` and `{tikzpicture}` can't be done dynamically with a conditional because, when the Tikz library `external` is loaded by the user, the pair `\tikzpicture-\endtikzpicture` (or `\begin{tikzpicture}-\end{tikzpicture}`) must be statically “visible” (even when externalization is not activated).

That's why we create `\c_@@_pgfortikzpicture_tl` and `\c_@@_endpgfortikzpicture_tl` which will be used to construct in a `\AtBeginDocument` the correct version of some commands.

```

40      \bool_set_true:N \c_@@_tikz_loaded_bool
41      \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \tikzpicture }
42      \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endtikzpicture }
43  }
44  {
45      \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \pgfpicture }
46      \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endpgfpicture }
47  }
48 }
```

We test whether the current class is `revtex4-1` (deprecated) or `revtex4-2` because these classes redefines `\array` (of `array`) in a way incompatible with our programmation. As of january 2021, the current version `revtex4-2` is 4.2e (compatible with `booktabs`).

```

49 \bool_new:N \c_@@_revtex_bool
50 \@ifclassloaded { revtex4-1 }
51   { \bool_set_true:N \c_@@_revtex_bool }
52   { }
53 \@ifclassloaded { revtex4-2 }
54   { \bool_set_true:N \c_@@_revtex_bool }
55   { }
```

Maybe one of the previous classes will be loaded inside another class... We try to detect that situation.

```

56 \cs_if_exist:NT \rvtx@iffORMAT@geq { \bool_set_true:N \c_@@_revtex_bool }
57 \cs_generate_variant:Nn \tl_if_single_token_p:n { V }
```

We define a command `\iddots` similar to `\ddots` (\cdots) but with dots going forward ($\cdot\cdot\cdot$). We use `\ProvideDocumentCommand` and so, if the command `\iddots` has already been defined (for example by the package `mathdots`), we don't define it again.

```

58 \ProvideDocumentCommand \iddots { }
59  {
60    \mathinner
61    {
62      \tex_mkern:D 1 mu
63      \box_move_up:nn { 1 pt } { \hbox:n { . } }
64      \tex_mkern:D 2 mu
65      \box_move_up:nn { 4 pt } { \hbox:n { . } }
66      \tex_mkern:D 2 mu
67      \box_move_up:nn { 7 pt }
68      { \vbox:n { \kern 7 pt \hbox:n { . } } }
69      \tex_mkern:D 1 mu
70    }
71 }
```

This definition is a variant of the standard definition of `\ddots`.

In the `aux` file, we will have the references of the PGF/Tikz nodes created by `nicematrix`. However, when `booktabs` is used, some nodes (more precisely, some `row` nodes) will be defined twice because their position will be modified. In order to avoid an error message in this case, we will redefine `\pgfutil@check@rerun` in the `aux` file.

```

72 \AtBeginDocument
73  {
74    \@ifpackageloaded { booktabs }
75    { \iow_now:Nn \mainaux \nicematrix@redefine@check@rerun }
76    { }
77 }
```

```

78 \cs_set_protected:Npn \nicematrix@redefine@check@rerun
79 {
80     \cs_set_eq:NN \@@_old_pgfutil@check@rerun \pgfutil@check@rerun

```

The new version of `\pgfutil@check@rerun` will not check the PGF nodes whose names start with `nm-` (which is the prefix for the nodes creates by `nicematrix`).

```

81     \cs_set_protected:Npn \pgfutil@check@rerun ##1 ##2
82     {
83         \str_if_eq:eeF { nm- } { \tl_range:nnn { ##1 } 1 3 }
84         { \@@_old_pgfutil@check@rerun { ##1 } { ##2 } }
85     }
86 }

```

We have to know whether `colortbl` is loaded in particular for the redefinition of `\everycr`.

```

87 \bool_new:N \c_@@_colortbl_loaded_bool
88 \AtBeginDocument
89 {
90     \ifpackageloaded { colortbl }
91     { \bool_set_true:N \c_@@_colortbl_loaded_bool }
92 }

```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. We will use it to store the instruction of color for the rules even if `colortbl` is not loaded. Idem for

```

93     \cs_set_protected:Npn \CT@arc@ { }
94     \cs_set:Npn \arrayrulecolor #1 # { \CT@arc { #1 } }
95     \cs_set:Npn \CT@arc #1 #2
96     {
97         \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
98         { \cs_gset:Npn \CT@arc@ { \color { #1 } { #2 } } }
99     }

```

Idem for `\CT@drs@`.

```

100    \cs_set_protected:Npn \CT@drsc@ { }
101    \cs_set:Npn \doublerulesepcolor #1 # { \CT@drs { #1 } }
102    \cs_set:Npn \CT@drs #1 #2
103    {
104        \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
105        { \cs_gset:Npn \CT@drsc@ { \color { #1 } { #2 } } }
106    }
107    \cs_set:Npn \hline
108    {
109        \noalign { \ifnum 0 = `} \fi
110        \cs_set_eq:NN \hskip \vskip
111        \cs_set_eq:NN \vrule \hrule
112        \cs_set_eq:NN \ewidth \height
113        { \CT@arc@ \vline }
114        \futurelet \reserved@a
115        \xhline
116    }
117 }
118 }

```

We have to redefine `\cline` for several reasons. The command `\@@_cline` will be linked to `\cline` in the beginning of `{NiceArrayWithDelims}`. The following commands must *not* be protected.

```

119 \cs_set:Npn \@@_standard_cline #1 { \@@_standard_cline:w #1 \q_stop }
120 \cs_set:Npn \@@_standard_cline:w #1-#2 \q_stop
121 {
122     \int_compare:nNnT \l_@@_first_col_int = 0 { \omit & }
123     \int_compare:nNnT { #1 } > 1 { \multispan { \@@_pred:n { #1 } } & }
124     \multispan { \int_eval:n { #2 - #1 + 1 } }
125 {
126     \CT@arc@
127     \leaders \hrule \height \arrayrulewidth \hfill

```

The following `\skip_horizontal:N \c_zero_dim` is to prevent a potential `\unskip` to delete the `\leaders`³⁷

```
128     \skip_horizontal:N \c_zero_dim
129 }
```

Our `\everycr` has been modified. In particular, the creation of the `row` node is in the `\everycr` (maybe we should put it with the incrementation of `\c@iRow`). Since the following `\cr` correspond to a “false row”, we have to nullify `\everycr`.

```
130     \everycr { }
131     \cr
132     \noalign { \skip_vertical:N -\arrayrulewidth }
133 }
```

The following version of `\cline` spreads the array of a quantity equal to `\arrayrulewidth` as does `\hline`. It will be loaded excepted if the key `standard-cline` has been used.

```
134 \cs_set:Npn \@@_cline
```

We have to act in a fully expandable way since there may be `\noalign` (in the `\multispan`) to detect. That’s why we use `\@@_cline_i:en`.

```
135 { \@@_cline_i:en \l_@@_first_col_int }
```

The command `\cline_i:nn` has two arguments. The first is the number of the current column (it *must* be used in that column). The second is a standard argument of `\cline` of the form *i-j*.

```
136 \cs_set:Npn \@@_cline_i:nn #1 #2 { \@@_cline_i:w #1-#2 \q_stop }
137 \cs_set:Npn \@@_cline_i:w #1-#2-#3 \q_stop
138 {
```

Now, `#1` is the number of the current column and we have to draw a line from the column `#2` to the column `#3` (both included).

```
139 \int_compare:nNnT { #1 } < { #2 }
140   { \multispan { \int_eval:n { #2 - #1 } } & }
141   \multispan { \int_eval:n { #3 - #2 + 1 } }
142   {
143     \CT@arc@
144     \leaders \hrule \height \arrayrulewidth \hfill
145     \skip_horizontal:N \c_zero_dim
146   }
```

You look whether there is another `\cline` to draw (the final user may put several `\cline`).

```
147 \peek_meaning_remove_ignore_spaces:NTF \cline
148   { & \@@_cline_i:en { \@@_succ:n { #3 } } }
149   { \everycr { } \cr }
150 }
151 \cs_generate_variant:Nn \@@_cline_i:nn { e n }
```

The following commands are only for efficiency. They must *not* be protected because it will be used (for instance) in names of PGF nodes.

```
152 \cs_new:Npn \@@_succ:n #1 { \the \numexpr #1 + 1 \relax }
153 \cs_new:Npn \@@_pred:n #1 { \the \numexpr #1 - 1 \relax }
```

The following command is a small shortcut.

```
154 \cs_new:Npn \@@_math_toggle_token:
155   { \bool_if:NF \l_@@_NiceTabular_bool \c_math_toggle_token }

156 \cs_new_protected:Npn \@@_set_CT@arc@:
157   { \peek_meaning:NTF [ \@@_set_CT@arc@_i: \@@_set_CT@arc@_ii: ]
158 \cs_new_protected:Npn \@@_set_CT@arc@_i: [ #1 ] #2 \q_stop
159   { \cs_set:Npn \CT@arc@ { \color [ #1 ] { #2 } } }
160 \cs_new_protected:Npn \@@_set_CT@arc@_ii: #1 \q_stop
161   { \cs_set:Npn \CT@arc@ { \color { #1 } } }
```

³⁷See question 99041 on TeX StackExchange.

The column S of siunitx

We want to know whether the package `siunitx` is loaded and, if it is loaded, we redefine the `S` columns of `siunitx`.

```

162 \bool_new:N \c_@@_siunitx_loaded_bool
163 \AtBeginDocument
164 {
165   \ifpackageloaded { siunitx }
166   { \bool_set_true:N \c_@@_siunitx_loaded_bool }
167   { }
168 }
```

The command `\NC@rewrite@S` is a LaTeX command created by `siunitx` in connection with the `S` column. In the code of `siunitx`, this command is defined by:

```

\renewcommand*{\NC@rewrite@S}[1] []
{
  \temptokena \exp_after:wN
  {
    \tex_the:D \temptokena
    > { \__siunitx_table_collect_begin: S {#1} }
    c
    < { \__siunitx_table_print: }
  }
  \NC@find
}
```

We want to patch this command (in the environments of `nicematrix`) in order to have:

```

\renewcommand*{\NC@rewrite@S}[1] []
{
  \temptokena \exp_after:wN
  {
    \tex_the:D \temptokena
    > { \@@_Cell: \__siunitx_table_collect_begin: S {#1} }
    \@@_true_c:
    < { \__siunitx_table_print: \@@_end_Cell: }
  }
  \NC@find
}
```

However, we don't want to use explicitly any private command of `siunitx`. That's why we will extract the name of the two `__siunitx...` commands by their position in the code of `\NC@rewrite@S`. Since the command `\NC@rewrite@S` appends some tokens to the `toks` list `\temptokena`, we use the LaTeX command `\NC@rewrite@S` in a group (`\group_begin:-\group_end:`) and we extract the two command names which are in the `toks` `\temptokena`. However, this extraction can be done only when `siunitx` is loaded (and it may be loaded after `nicematrix`) and, in fact, after the beginning of the document — because some instructions of `siunitx` are executed in a `\AtBeginDocument`). That's why this extraction will be done only at the first use of an environment of `nicematrix` with the command `\@@_adapt_S_column:`.

```

169 \cs_set_protected:Npn \@@_adapt_S_column:
170 {
171   \bool_if:NT \c_@@_siunitx_loaded_bool
172   {
173     \group_begin:
174     \temptokena = { }
```

We protect `\NC@find` which is at the end of `\NC@rewrite@S`.

```

175   \cs_set_eq:NN \NC@find \prg_do_nothing:
176   \NC@rewrite@S { }
```

Conversion of the `toks` `\temptokena` in a token list of `expl3` (the `toks` are not supported by `expl3` but we can, nevertheless, use the option `V` for `\tl_gset:NV`).

```

177   \tl_gset:NV \g_tmpa_tl \temptokena
178   \group_end:
```

```

179   \tl_new:N \c_@@_table_collect_begin_tl
180   \tl_set:Nx \l_tmpa_tl { \tl_item:Nn \g_tmpa_tl 2 }
181   \tl_gset:Nx \c_@@_table_collect_begin_tl { \tl_item:Nn \l_tmpa_tl 1 }
182   \tl_new:N \c_@@_table_print_tl
183   \tl_gset:Nx \c_@@_table_print_tl { \tl_item:Nn \g_tmpa_tl { -1 } }

```

The token lists `\c_@@_table_collect_begin_tl` and `\c_@@_table_print_tl` contain now the two commands of `siunitx`.

If the adaptation has been done, the command `\@@_adapt_S_column:` becomes no-op (globally).

```

184   \cs_gset_eq:NN \@@_adapt_S_column: \prg_do_nothing:
185   }
186 }

```

The command `\@@_renew_NC@rewrite@S:` will be used in each environment of `nicematrix` in order to “rewrite” the `S` column in each environment.

```

187 \AtBeginDocument
188 {
189   \bool_if:nTF { ! \c_@@_siunitx_loaded_bool }
190   { \cs_set_eq:NN \@@_renew_NC@rewrite@S: \prg_do_nothing: }
191   {
192     \cs_new_protected:Npn \@@_renew_NC@rewrite@S:
193     {
194       \renewcommand*\{NC@rewrite@S}[1] []
195       {
196         \@temptokena \exp_after:wN
197         {
198           \tex_the:D \@temptokena
199           > { \@@_Cell: \c_@@_table_collect_begin_tl S {##1} }
200       \@@_true_c: will be replaced statically by c at the end of the construction of the preamble.
201       \@@_true_c:
202       < { \c_@@_table_print_tl \@@_end_Cell: }
203       \NC@find
204     }
205   }
206 }
207 }

```

The following regex will be used to modify the preamble of the array when the key `colortbl-like` is used.

```
208 \regex_const:Nn \c_@@_columncolor_regex { \c { columncolor } }
```

If the final user uses `nicematrix`, PGF/Tikz will write instruction `\pgfsyspdfmark` in the `aux` file. If he changes its mind and no longer loads `nicematrix`, an error may occur at the next compilation because of remanent instructions `\pgfsyspdfmark` in the `aux` file. With the following code, we avoid that situation.

```

209 \cs_new_protected:Npn \@@_provide_pgfsyspdfmark:
210 {
211   \iow_now:Nn \mainaux
212   {
213     \ExplSyntaxOn
214     \cs_if_free:NT \pgfsyspdfmark
215     { \cs_set_eq:NN \pgfsyspdfmark \gobblethree }
216     \ExplSyntaxOff
217   }
218   \cs_gset_eq:NN \@@_provide_pgfsyspdfmark: \prg_do_nothing:
219 }

```

Parameters

For compatibility with versions prior to 5.0, we provide a load-time option `define_L_C_R`. With this option, it's possible the letters L, C and R instead of l, c and r in the preamble of the environments of `nicematrix` as it was mandatory before version 5.0.

```

220 \bool_new:N \c_@@_define_L_C_R_bool
221 \cs_new_protected:Npn \@@_define_L_C_R:
222 {
223     \newcolumntype{L}{l}
224     \newcolumntype{C}{c}
225     \newcolumntype{R}{r}
226 }
```

The following counter will count the environments `{NiceArray}`. The value of this counter will be used to prefix the names of the Tikz nodes created in the array.

```
227 \int_new:N \g_@@_env_int
```

The following command is only a syntactic shortcut. It must *not* be protected (it will be used in names of PGF nodes).

```
228 \cs_new:Npn \@@_env: { nm - \int_use:N \g_@@_env_int }
```

The command `\NiceMatrixLastEnv` is not used by the package `nicematrix`. It's only a facility given to the final user. It gives the number of the last environment (in fact the number of the current environment but it's meant to be used after the environment in order to refer to that environment — and its nodes — without having to give it a name). This command *must* be expandable since it will be used in pgf nodes.

```

229 \NewExpandableDocumentCommand \NiceMatrixLastEnv { }
230 { \int_use:N \g_@@_env_int }
```

The following command is only a syntactic shortcut. The q in `qpoint` means *quick*.

```

231 \cs_new_protected:Npn \@@_qpoint:n #1
232 { \pgfpointanchor { \@@_env: - #1 } { center } }
```

The following counter will count the environments `{NiceMatrixBlock}`.

```
233 \int_new:N \g_@@_NiceMatrixBlock_int
```

The dimension `\l_@@_columns_width_dim` will be used when the options specify that all the columns must have the same width (but, if the key `columns-width` is used with the special value `auto`, the boolean `\l_@@_auto_columns_width_bool` also will be raised).

```
234 \dim_new:N \l_@@_columns_width_dim
```

The following token list will contain the type of the current cell (l, c or r). It will be used by the blocks.

```

235 \tl_new:N \l_@@_cell_type_tl
236 \tl_set:Nn \l_@@_cell_type_tl { c }
```

When there is a mono-column block (created by the command `\Block`), we want to take into account the width of that block for the width of the column. That's why we compute the width of that block in the `\g_@@_blocks_wd_dim` and, after the construction of the box `\l_@@_cell_box`, we change the width of that box to take into account the length `\g_@@_blocks_wd_dim`.

```
237 \dim_new:N \g_@@_blocks_wd_dim
```

Idem pour the blocks mono-row.

```

238 \dim_new:N \g_@@_blocks_ht_dim
239 \dim_new:N \g_@@_blocks_dp_dim
```

The sequence `\g_@@_names_seq` will be the list of all the names of environments used (via the option `name`) in the document: two environments must not have the same name. However, it's possible to use the option `allow-duplicate-names`.

```
240 \seq_new:N \g_@@_names_seq
```

We want to know if we are in an environment of `nicematrix` because we will raise an error if the user tries to use nested environments.

```
241 \bool_new:N \l_@@_in_env_bool
```

If the user uses `{NiceArray}` or `{NiceTabular}` the flag `\l_@@_NiceArray_bool` will be raised.

```
242 \bool_new:N \l_@@_NiceArray_bool
```

If the user uses `{NiceTabular}` or `{NiceTabular*}`, we will raise the following flag.

```
243 \bool_new:N \l_@@_NiceTabular_bool
```

If the user uses `{NiceTabular*}`, the width of the tabular (in the first argument of the environment `{NiceTabular*}`) will be stored in the following dimension.

```
244 \dim_new:N \l_@@_tabular_width_dim
```

If the user uses an environment without preamble, we will raise the following flag.

```
245 \bool_new:N \l_@@_Matrix_bool
```

The following boolean will be raised when the command `\rotate` is used.

```
246 \bool_new:N \g_@@_rotate_bool
```

```
247 \cs_new_protected:Npn \@@_test_if_math_mode:
248 {
249   \if_mode_math: \else:
250     \@@_fatal:n { Outside~math-mode }
251   \fi:
252 }
```

The following colors will be used to memorize le color of the potential “first col” and the potential “first row”.

```
253 \colorlet{nicematrix-last-col}{.}
254 \colorlet{nicematrix-last-row}{.}
```

The following string is the name of the current environment or the current command of `nicematrix` (despite its name which contains `env`).

```
255 \str_new:N \g_@@_name_env_str
```

The following string will contain the word `command` or `environment` whether we are in a command of `nicematrix` or in an environment of `nicematrix`. The default value is `environment`.

```
256 \tl_set:Nn \g_@@_com_or_env_str { environment }
```

The following command will be able to reconstruct the full name of the current command or environment (despite its name which contains `env`). This command must *not* be protected since it will be used in error messages and we have to use `\str_if_eq:VnTF` and not `\tl_if_eq:NnTF` because we need to be fully expandable).

```
257 \cs_new:Npn \@@_full_name_env:
258 {
259   \str_if_eq:VnTF \g_@@_com_or_env_str { command }
260   { command \space \c_backslash_str \g_@@_name_env_str }
261   { environment \space \{ \g_@@_name_env_str \} }
262 }
```

The following token list corresponds to the option `code-after` (it's also possible to set the value of that parameter with the keyword `\CodeAfter`).

```
263 \tl_new:N \g_nicematrix_code_after_tl
```

The following token list has a function similar to `\g_nicematrix_code_after_tl` but it is used internally by `nicematrix`. In fact, we have to distinguish between `\g_nicematrix_code_after_tl` and `\g_@@_internal_code_after_tl` because we must take care of the order in which instructions stored in that parameters are executed.

```
264 \tl_new:N \g_@@_internal_code_after_tl
```

The counters `\l_@@_old_iRow_int` and `\l_@@_old_jCol_int` will be used to save the values of the potential LaTeX counters `iRow` and `jCol`. These LaTeX counters will be restored at the end of the environment.

```
265 \int_new:N \l_@@_old_iRow_int
266 \int_new:N \l_@@_old_jCol_int
```

The TeX counters `\c@iRow` and `\c@jCol` will be created in the beginning of `{NiceArrayWithDelims}` (if they don't exist previously).

The following token list corresponds to the key `rules/color` available in the environments.

```
267 \tl_new:N \l_@@_rules_color_tl
```

This boolean will be used only to detect in an expandable way whether we are at the beginning of the (potential) column zero, in order to raise an error if `\Hdotsfor` is used in that column.

```
268 \bool_new:N \g_@@_after_col_zero_bool
```

A kind of false row will be inserted at the end of the array for the construction of the `col` nodes (and also to fix the width of the columns when `columns-width` is used). When this special row will be created, we will raise the flag `\g_@@_row_of_col_done_bool` in order to avoid some actions set in the redefinition of `\everycr` when the last `\cr` of the `\halign` will occur (after that row of `col` nodes).

```
269 \bool_new:N \g_@@_row_of_col_done_bool
```

It's possible to use the command `\NotEmpty` to specify explicitly that a cell must be considered as non empty by `nicematrix` (the Tikz nodes are constructed only in the non empty cells).

```
270 \bool_new:N \g_@@_not_empty_cell_bool
```

`\l_@@_code_before_tl` may contain two types of informations:

- A `code-before` written in the aux file by a previous run. When the aux file is read, this `code-before` is stored in `\g_@@_code_before_i_tl` (where *i* is the number of the environment) and, at the beginning of the environment, it will be put in `\l_@@_code_before_tl`.
- The final user can explicitly add material in `\l_@@_code_before_tl` by using the key `code-before`.

```
271 \tl_new:N \l_@@_code_before_tl
272 \bool_new:N \l_@@_code_before_bool
```

The following dimensions will be used when drawing the dotted lines.

```
273 \dim_new:N \l_@@_x_initial_dim
274 \dim_new:N \l_@@_y_initial_dim
275 \dim_new:N \l_@@_x_final_dim
276 \dim_new:N \l_@@_y_final_dim
```

`expl3` provides scratch dimensions `\l_tmpa_dim` and `\l_tmpb_dim`. We creates two other in the same spirit (if they don't exist yet: that's why we use `\dim_zero_new:N`).

```
277 \dim_zero_new:N \l_tmpc_dim
278 \dim_zero_new:N \l_tmpd_dim
```

Some cells will be declared as “empty” (for example a cell with an instruction `\Cdots`).

```
279 \bool_new:N \g_@@_empty_cell_bool
```

The following dimension will be used to save the current value of `\arraycolsep`.

```
280 \dim_new:N \g_@@_old_arraycolsep_dim
```

The following dimensions will be used internally to compute the width of the potential “first column” and “last column”.

```
281 \dim_new:N \g_@@_width_last_col_dim  
282 \dim_new:N \g_@@_width_first_col_dim
```

The following sequence will contain the characteristics of the blocks of the array, specified by the command `\Block`. Each block is represented by 6 components surrounded by braces:

`{imin}{jmin}{imax}{jmax}{options}{contents}`.

The variable is global because it will be modified in the cells of the array.

```
283 \seq_new:N \g_@@_blocks_seq
```

We also manage a sequence of the *positions* of the blocks. Of course, it’s redundant with the previous sequence, but it’s for efficiency. In that sequence, each block is represented by only the four first components: `{imin}{jmin}{imax}{jmax}`.

```
284 \seq_new:N \g_@@_pos_of_blocks_seq
```

In fact, this sequence will also contain the positions of the cells with a `\diagbox`. The sequence `\g_@@_pos_of_blocks_seq` will be used when we will draw the rules (which respect the blocks).

We will also manage a sequence for the positions of the dotted lines. These dotted lines are created in the array by `\Cdots`, `\Vdots`, `\Ddots`, etc. However, their positions, that is to say, their extremities, will be determined only after the construction of the array. In this sequence, each item contains four components: `{imin}{jmin}{imax}{jmax}`.

```
285 \seq_new:N \g_@@_pos_of_xdots_seq
```

The sequence `\g_@@_pos_of_xdots_seq` will be used when we will draw the rules required by the key `hvlines` (these rules won’t be drawn within the virtual blocks corresponding to the dotted lines).

The final user may decide to “stroke” a block (using, for example, the key `color=red!15` when using the command `\Block`). In that case, the rules specified, for instance, by `hvlines` must not be drawn around the block. That’s why we keep the information of all that stroken blocks in the following sequence.

```
286 \seq_new:N \g_@@_pos_of_stroken_blocks_seq
```

The list of the names of the potential `\SubMatrix` in the `code-after` of an environment. Unfortunately, that list has to be global (we have to use it inside the group for the options of a given `\SubMatrix`).

```
287 \seq_new:N \g_@@_submatrix_names_seq
```

We are able to determine the number of columns specified in the preamble (for the environments with explicit preamble, of course and without the potential exterior columns).

```
288 \int_new:N \g_@@_static_num_of_col_int
```

The following token lists correspond to the keys `fill` and `draw` of a command `\Block`.

```
289 \tl_new:N \l_@@_fill_tl  
290 \tl_new:N \l_@@_draw_tl
```

The following token list correspond to the key `color` of the command `\Block`. However, as of now (v. 5.7 of `nicematrix`), the key `color` linked to `fill` with an error. We will give to the key `color` of `\Block` its new meaning in a few months (with its new definition, the key `color` will draw the frame with the given color but also color the content of the block (that is to say the text) as does the key `color` of a Tikz node).

```
291 \tl_new:N \l_@@_color_tl
```

Here is the dimension for the width of the rule when a block (created by \Block) is stroked.

```
292 \dim_new:N \l_@@_line_width_dim
```

The parameter of position of the label of a block (c, r or l).

```
293 \tl_new:N \l_@@_pos_of_block_tl  
294 \tl_set:Nn \l_@@_pos_of_block_tl { c }
```

Used when the key `draw-first` is used for \Ddots or \Idots.

```
295 \bool_new:N \l_@@_draw_first_bool
```

The blocks which use the key – will store their content in a box. These boxes are numbered with the following counter.

```
296 \int_new:N \g_@@_block_box_int
```

Variables for the exterior rows and columns

The keys for the exterior rows and columns are `first-row`, `first-col`, `last-row` and `last-col`. However, internally, these keys are not coded in a similar way.

- **First row**

The integer `\l_@@_first_row_int` is the number of the first row of the array. The default value is 1, but, if the option `first-row` is used, the value will be 0.

```
297 \int_new:N \l_@@_first_row_int  
298 \int_set:Nn \l_@@_first_row_int 1
```

- **First column**

The integer `\l_@@_first_col_int` is the number of the first column of the array. The default value is 1, but, if the option `first-col` is used, the value will be 0.

```
299 \int_new:N \l_@@_first_col_int  
300 \int_set:Nn \l_@@_first_col_int 1
```

- **Last row**

The counter `\l_@@_last_row_int` is the number of the potential “last row”, as specified by the key `last-row`. A value of -2 means that there is no “last row”. A value of -1 means that there is a “last row” but we don’t know the number of that row (the key `last-row` has been used without value and the actual value has not still been read in the aux file).

```
301 \int_new:N \l_@@_last_row_int  
302 \int_set:Nn \l_@@_last_row_int { -2 }
```

If, in an environment like `{pNiceArray}`, the option `last-row` is used without value, we will globally raise the following flag. It will be used to know if we have, after the construction of the array, to write in the aux file the number of the “last row”.³⁸

```
303 \bool_new:N \l_@@_last_row_without_value_bool
```

Idem for `\l_@@_last_col_without_value_bool`

```
304 \bool_new:N \l_@@_last_col_without_value_bool
```

³⁸We can’t use `\l_@@_last_row_int` for this usage because, if `nicematrix` has read its value from the aux file, the value of the counter won’t be -1 any longer.

- **Last column**

For the potential “last column”, we use an integer. A value of -2 means that there is no last column. A value of -1 means that we are in an environment without preamble (e.g. `{bNiceMatrix}`) and there is a last column but we don’t know its value because the user has used the option `last-col` without value. A value of 0 means that the option `last-col` has been used in an environment with preamble (like `{pNiceArray}`): in this case, the key was necessary without argument.

```
305 \int_new:N \l_@@_last_col_int
306 \int_set:Nn \l_@@_last_col_int { -2 }
```

However, we have also a boolean. Consider the following code:

```
\begin{pNiceArray}{cc}[last-col]
1 & 2 \\
3 & 4
\end{pNiceArray}
```

In such a code, the “last column” specified by the key `last-col` is not used. We want to be able to detect such a situation and we create a boolean for that job.

```
307 \bool_new:N \g_@@_last_col_found_bool
```

This boolean is set to `false` at the end of `\@_pre_array`:

The command `\tabularnote`

The LaTeX counter `tabularnote` will be used to count the tabular notes during the construction of the array (this counter won’t be used during the composition of the notes at the end of the array). You use a LaTeX counter because we will use `\refstepcounter` in order to have the tabular notes referenceable.

```
308 \newcounter{tabularnote}
```

We will store in the following sequence the tabular notes of a given array.

```
309 \seq_new:N \g_@@_tabularnotes_seq
```

However, before the actual tabular notes, it’s possible to put a text specified by the key `tabularnote` of the environment. The token list `\l_@@_tabularnote_tl` corresponds to the value of that key.

```
310 \tl_new:N \l_@@_tabularnote_tl
```

The following counter will be used to count the number of successive tabular notes such as in `\tabularnote{Note 1}\tabularnote{Note 2}\tabularnote{Note 3}`. In the tabular, the labels of those nodes are composed as a comma separated list (e.g. a, b, c).

```
311 \int_new:N \l_@@_number_of_notes_int
```

The following function can be redefined by using the key `notes/style`.

```
312 \cs_new:Npn \g_@@_notes_style:n #1 { \textit{ \alph{#1} } }
```

The following fonction can be redefined by using the key `notes/label-in-tabular`.

```
313 \cs_new:Npn \g_@@_notes_label_in_tabular:n #1 { \textsuperscript{ #1 } }
```

The following function can be redefined by using the key `notes/label-in-list`.

```
314 \cs_new:Npn \g_@@_notes_label_in_list:n #1 { \textsuperscript{ #1 } }
```

We define `\thetabularnote` because it will be used by LaTeX if the user want to reference a footnote which has been marked by a `\label`. The TeX group is for the case where the user has put an instruction such as `\color{red}` in `\@@_notes_style:n`.

```
315 \cs_set:Npn \thetabularnote { { \@@_notes_style:n { tabularnote } } }
```

The tabular notes will be available for the final user only when `enumitem` is loaded. Indeed, the tabular notes will be composed at the end of the array with a list customized by `enumitem` (a list `tabularnotes` in the general case and a list `tabularnotes*` if the key `para` is in force). However, we can test whether `enumitem` has been loaded only at the beginning of the document (we want to allow the user to load `enumitem` after `nicematrix`).

```
316 \AtBeginDocument
317 {
318     \bool_if:nTF { ! \c_@@_enumitem_loaded_bool }
319     {
320         \NewDocumentCommand \tabularnote { m }
321         { \@@_error:n { enumitem-not-loaded } }
322     }
323 }
```

The type of list `tabularnotes` will be used to format the tabular notes at the end of the array in the general case and `tabularnotes*` will be used if the key `para` is in force.

```
324 \newlist { tabularnotes } { enumerate } { 1 }
325 \setlist [ tabularnotes ]
326 {
327     topsep = Opt ,
328     noitemsep ,
329     leftmargin = * ,
330     align = left ,
331     labelsep = Opt ,
332     label =
333     \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotesi } } ,
334 }
335 \newlist { tabularnotes* } { enumerate* } { 1 }
336 \setlist [ tabularnotes* ]
337 {
338     afterlabel = \nobreak ,
339     itemjoin = \quad ,
340     label =
341     \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotes*i } }
342 }
```

The command `\tabularnote` is available in the whole document (and not only in the environments of `nicematrix`) because we want it to be available in the caption of a `{table}` (before the following `{NiceTabular}` or `{NiceArray}`). That's also the reason why the variables `\c@tabularnote` and `\g_@@_tabularnotes_seq` will be cleared at the end of the environment of `nicematrix` (and not at the beginning).

Unfortunately, if the package `caption` is loaded, the command `\caption` evaluates its argument twice and since it is not aware (of course) of `\tabularnote`, the command `\tabularnote` is, in fact, not usable in `\caption` when `caption` is loaded.³⁹

```
343 \NewDocumentCommand \tabularnote { m }
344 {
345     \bool_if:nTF { ! \l_@@_NiceArray_bool && \l_@@_in_env_bool }
346     { \@@_error:n { tabularnote-forbidden } }
347 }
```

`\l_@@_number_of_notes_int` is used to count the number of successive tabular notes such as in `\tabularnote{Note 1}\tabularnote{Note 2}\tabularnote{Note 3}`. We will have to compose the labels of theses notes as a comma separated list (e.g. `a,b,c`).

```
348 \int_incr:N \l_@@_number_of_notes_int
```

³⁹We should try to find a solution to that problem.

We expand the content of the note at the point of use of `\tabularnote` as does `\footnote`.

```
349           \seq_gput_right:Nn \g_@@_tabularnotes_seq { #1 }
350           \peek_meaning:NF \tabularnote
351           {
```

If the following token is *not* a `\tabularnote`, we have finished the sequence of successive commands `\tabularnote` and we have to format the labels of these tabular notes (in the array). We compose those labels in a box `\l_tmpa_box` because we will do a special construction in order to have this box in a overlapping position if we are at the end of a cell.

```
352           \hbox_set:Nn \l_tmpa_box
353           {
```

We remind that it is the command `\@@_notes_label_in_tabular:n` that will (most of the time) put the labels in a `\textsuperscript`.

```
354           \@@_notes_label_in_tabular:n
355           {
356             \stepcounter { tabularnote }
357             \@@_notes_style:n { tabularnote }
358             \prg_replicate:nn { \l_@@_number_of_notes_int - 1 }
359             {
360               ,
361               \stepcounter { tabularnote }
362               \@@_notes_style:n { tabularnote }
363             }
364           }
```

We use `\refstepcounter` in order to have the (last) tabular note referenceable (with the standard command `\label`) and that's why we have to go back with a decrementation of the counter `tabularnote` first.

```
366           \addtocounter { tabularnote } { -1 }
367           \refstepcounter { tabularnote }
368           \int_zero:N \l_@@_number_of_notes_int
369           \hbox_overlap_right:n { \box_use:N \l_tmpa_box }
```

If the command `\tabularnote` is used exactly at the end of the cell, the `\unskip` (inserted by `array?`) will delete the skip we insert now and the label of the footnote will be composed in an overlapping position (by design).

```
370           \skip_horizontal:n { \box_wd:N \l_tmpa_box }
371           }
372         }
373       }
374     }
375 }
```

Command for creation of rectangle nodes

The following command should be used in a `{pgfpicture}`. It creates a rectangle (empty but with a name).

#1 is the name of the node which will be created; #2 and #3 are the coordinates of one of the corner of the rectangle; #4 and #5 are the coordinates of the opposite corner.

```
376 \cs_new_protected:Npn \@@_pgf_rect_node:nnnnn #1 #2 #3 #4 #5
377   {
378     \begin{pgfscope}
379       \pgfset
380       {
381         outer sep = \c_zero_dim ,
382         inner sep = \c_zero_dim ,
383         minimum size = \c_zero_dim
384       }
385       \pgftransformshift { \pgfpoint { 0.5 * ( #2 + #4 ) } { 0.5 * ( #3 + #5 ) } }
386       \pgfnode
387       { rectangle }
```

```

388 { center }
389 {
390   \vbox_to_ht:nn
391   { \dim_abs:n { #5 - #3 } }
392   {
393     \vfill
394     \hbox_to_wd:nn { \dim_abs:n { #4 - #2 } } { }
395   }
396 }
397 { #1 }
398 { }
399 \end { pgfscope }
400 }

```

The command `\@@_pgf_rect_node:nnn` is a variant of `\@@_pgr_rect_node:nnnn`: it takes two PGF points as arguments instead of the four dimensions which are the coordinates.

```

401 \cs_new_protected:Npn \@@_pgf_rect_node:nnn #1 #2 #3
402 {
403   \begin { pgfscope }
404   \pgfset
405   {
406     outer_sep = \c_zero_dim ,
407     inner_sep = \c_zero_dim ,
408     minimum_size = \c_zero_dim
409   }
410   \pgftransformshift { \pgfpointscale { 0.5 } { \pgfpointadd { #2 } { #3 } } }
411   \pgfpointdiff { #3 } { #2 }
412   \pgfgetlastxy \l_tmpa_dim \l_tmpb_dim
413   \pgfnode
414   {
415     rectangle
416     center
417   }
418   \vbox_to_ht:nn
419   { \dim_abs:n \l_tmpb_dim }
420   { \vfill \hbox_to_wd:nn { \dim_abs:n \l_tmpa_dim } { } }
421 { #1 }
422 { }
423 \end { pgfscope }
424 }

```

The options

By default, the commands `\cellcolor` and `\rowcolor` are available for the user in the cells of the tabular (the user may use the commands provided by `\colortbl`). However, if the key `colortbl-like` is used, these commands are available.

```
425 \bool_new:N \l_@@_colortbl_like_bool
```

By default, the behaviour of `\cline` is changed in the environments of `nicematrix`: a `\cline` spreads the array by an amount equal to `\arrayrulewidth`. It's possible to disable this feature with the key `\l_@@_standard_line_bool`.

```
426 \bool_new:N \l_@@_standard_cline_bool
```

The following dimensions correspond to the options `cell-space-top-limit` and `co` (these parameters are inspired by the package `cellspace`).

```

427 \dim_new:N \l_@@_cell_space_top_limit_dim
428 \dim_new:N \l_@@_cell_space_bottom_limit_dim

```

The following dimension is the distance between two dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.45 em but it will be changed if the option `small` is used.

```
429 \dim_new:N \l_@@_inter_dots_dim
430 \AtBeginDocument { \dim_set:Nn \l_@@_inter_dots_dim { 0.45 em } }
```

The `\AtBeginDocument` is only a security in case `revtex4-1` is used (even though it is obsolete).

The following dimension is the minimal distance between a node (in fact an anchor of that node) and a dotted line (we say “minimal” because, by definition, a dotted line is not a continuous line and, therefore, this distance may vary a little).

```
431 \dim_new:N \l_@@_xdots_shorten_dim
432 \AtBeginDocument { \dim_set:Nn \l_@@_xdots_shorten_dim { 0.3 em } }
```

The `\AtBeginDocument` is only a security in case `revtex4-1` is used (even though it is obsolete).

The following dimension is the radius of the dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.53 pt but it will be changed if the option `small` is used.

```
433 \dim_new:N \l_@@_radius_dim
434 \AtBeginDocument { \dim_set:Nn \l_@@_radius_dim { 0.53 pt } }
```

The `\AtBeginDocument` is only a security in case `revtex4-1` is used (even if it is obsolete).

The token list `\l_@@_xdots_line_style_tl` corresponds to the option `tikz` of the commands `\Cdots`, `\Ldots`, etc. and of the options `line-style` for the environments and `\NiceMatrixOptions`. The constant `\c_@@_standard_tl` will be used in some tests.

```
435 \tl_new:N \l_@@_xdots_line_style_tl
436 \tl_const:Nn \c_@@_standard_tl { standard }
437 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl
```

The boolean `\l_@@_light_syntax_bool` corresponds to the option `light-syntax`.

```
438 \bool_new:N \l_@@_light_syntax_bool
```

The string `\l_@@_baseline_tl` may contain one of the three values `t`, `c` or `b` as in the option of the environment `{array}`. However, it may also contain an integer (which represents the number of the row to which align the array).

```
439 \tl_new:N \l_@@_baseline_tl
440 \tl_set:Nn \l_@@_baseline_tl c
```

The flag `\l_@@_exterior_arraycolsep_bool` corresponds to the option `exterior-arraycolsep`. If this option is set, a space equal to `\arraycolsep` will be put on both sides of an environment `{NiceArray}` (as it is done in `{array}` of `array`).

```
441 \bool_new:N \l_@@_exterior_arraycolsep_bool
```

The flag `\l_@@_parallelize_diags_bool` controls whether the diagonals are parallelized. The initial value is `true`.

```
442 \bool_new:N \l_@@_parallelize_diags_bool
443 \bool_set_true:N \l_@@_parallelize_diags_bool
```

If the flag `\l_@@_vlines_bool` is raised, horizontal space will be reserved in the the preamble of the array (for the vertical rules) and, after the construction of the array, the vertical rules will be drawn.

```
444 \bool_new:N \l_@@_vlines_bool
```

If the flag `\l_@@_hlines_bool` is raised, vertical space will be reserved between the rows of the array (for the horizontal rules) and, after the construction of the array, the vertical rules will be drawn.

```
445 \bool_new:N \l_@@_hlines_bool
```

The flag `\l_@@_except_corners_bool` will be raised when the key `except-corners` will be used. In that case, the corners will be computed before we draw rules and the rules won't be drawn in the corners. As expected, the key `hvlines-except-corners` raises the key `except-corners`.

```
446 \clist_new:N \l_@@_except_corners_clist
447 \dim_new:N \l_@@_notes_above_space_dim
448 \AtBeginDocument { \dim_set:Nn \l_@@_notes_above_space_dim { 1 mm } }
```

The `\AtBeginDocument` is only a security in case `revtex4-1` is used (even if it is obsolete).

The flag `\l_@@_nullify_dots_bool` corresponds to the option `nullify-dots`. When the flag is down, the instructions like `\vdots` are inserted within a `\hphantom` (and so the constructed matrix has exactly the same size as a matrix constructed with the classical `{matrix}` and `\ldots`, `\vdots`, etc.).

```
449 \bool_new:N \l_@@_nullify_dots_bool
```

The following flag will be used when the current options specify that all the columns of the array must have the same width equal to the largest width of a cell of the array (except the cells of the potential exterior columns).

```
450 \bool_new:N \l_@@_auto_columns_width_bool
```

The string `\l_@@_name_str` will contain the optional name of the environment: this name can be used to access to the Tikz nodes created in the array from outside the environment.

```
451 \str_new:N \l_@@_name_str
```

The boolean `\l_@@_medium_nodes_bool` will be used to indicate whether the “medium nodes” are created in the array. Idem for the “large nodes”.

```
452 \bool_new:N \l_@@_medium_nodes_bool
453 \bool_new:N \l_@@_large_nodes_bool
```

The dimension `\l_@@_left_margin_dim` correspond to the option `left-margin`. Idem for the right margin. These parameters are involved in the creation of the “medium nodes” but also in the placement of the delimiters and the drawing of the horizontal dotted lines (`\hdottedline`).

```
454 \dim_new:N \l_@@_left_margin_dim
455 \dim_new:N \l_@@_right_margin_dim
```

The dimensions `\l_@@_extra_left_margin_dim` and `\l_@@_extra_right_margin_dim` correspond to the options `extra-left-margin` and `extra-right-margin`.

```
456 \dim_new:N \l_@@_extra_left_margin_dim
457 \dim_new:N \l_@@_extra_right_margin_dim
```

The token list `\l_@@_end_of_row_tl` corresponds to the option `end-of-row`. It specifies the symbol used to mark the ends of rows when the light syntax is used.

```
458 \tl_new:N \l_@@_end_of_row_tl
459 \tl_set:Nn \l_@@_end_of_row_tl { ; }
```

The following parameter is for the color the dotted lines drawn by `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` but *not* the dotted lines drawn by `\hdottedline` and “`:`”.

```
460 \tl_new:N \l_@@_xdots_color_tl
```

The following token list corresponds to the key `delimiters-color`.

```
461 \tl_new:N \l_@@_delimiters_color_tl
```

Sometimes, we want to have several arrays vertically juxtaposed in order to have an alignment of the columns of these arrays. To achieve this goal, one may wish to use the same width for all the columns (for example with the option `columns-width` or the option `auto-columns-width` of the environment `{NiceMatrixBlock}`). However, even if we use the same type of delimiters, the width of the delimiters may be different from an array to another because the width of the delimiter is function of its size. That's why we create an option called `max-delimiter-width` which will give to the delimiters the width of a delimiter (of the same type) of big size. The following boolean corresponds to this option.

```
462 \bool_new:N \l_@@_max_delimiter_width_bool
```

```
463 \keys_define:nn { NiceMatrix / xdots }
  {
    line-style .code:n =
    {
      \bool_lazy_or:nnTF
```

We can't use `\c_@@_tikz_loaded_bool` to test whether tikz is loaded because `\NiceMatrixOptions` may be used in the preamble of the document.

```
468   { \cs_if_exist_p:N \tikzpicture }
 469   { \str_if_eq_p:nn { #1 } { standard } }
 470   { \tl_set:Nn \l_@@_xdots_line_style_tl { #1 } }
 471   { \@@_error:n { bad-option-for-line-style } }
 472   ,
 473   line-style .value_required:n = true ,
 474   color .tl_set:N = \l_@@_xdots_color_tl ,
 475   color .value_required:n = true ,
 476   shorten .dim_set:N = \l_@@_xdots_shorten_dim ,
 477   shorten .value_required:n = true ,
```

The options `down` and `up` are not documented for the final user because he should use the syntax with `^` and `_`.

```
478   down .tl_set:N = \l_@@_xdots_down_tl ,
 479   up .tl_set:N = \l_@@_xdots_up_tl ,
```

The key `draw-first`, which is meant to be used only with `\Ddots` and `\Idots`, which be catched when `\Ddots` or `\Idots` is used (during the construction of the array and not when we draw the dotted lines).

```
480   draw-first .code:n = \prg_do_nothing: ,
 481   unknown .code:n = \@@_error:n { Unknown-option-for-xdots }
 482 }

```

Important code used by {NiceArrayWithDelims}

The pseudo-environment \@@_Cell:-\@@_end_Cell: will be used to format the cells of the array. In the code, the affectations are global because this pseudo-environment will be used in the cells of a \halign (via an environment {array}).

```

786 \cs_new_protected:Npn \@@_Cell:
787 {

```

At the beginning of the cell, we link \CodeAfter to a command which do *not* begin with \omit (whereas the standard version of \CodeAfter begins with \omit).

```

788   \cs_set_eq:NN \CodeAfter \@@_CodeAfter_i:n

```

We increment \c@jCol, which is the counter of the columns.

```

789   \int_gincr:N \c@jCol

```

Now, we increment the counter of the rows. We don't do this incrementation in the \everycr because some packages, like arydshln, create special rows in the \halign that we don't want to take into account.

```

790   \int_compare:nNnT \c@jCol = 1
791   { \int_compare:nNnT \l_@@_first_col_int = 1 \@@_begin_of_row: }
792   \int_gset:Nn \g_@@_col_total_int { \int_max:nn \g_@@_col_total_int \c@jCol }

```

The content of the cell is composed in the box \l_@@_cell_box because we want to compute some dimensions of the box. The \hbox_set_end: corresponding to this \hbox_set:Nw will be in the \@@_end_Cell: (and the potential \c_math_toggle_token also).

```

793   \hbox_set:Nw \l_@@_cell_box
794   \bool_if:NF \l_@@_NiceTabular_bool
795   {
796     \c_math_toggle_token
797     \bool_if:NT \l_@@_small_bool \scriptstyle
798   }

```

We will call *corners* of the matrix the cases which are at the intersection of the exterior rows and exterior columns (of course, the four corners doesn't always exist simultaneously).

The codes `\l_@@_code_for_first_row_tl` and `al` don't apply in the corners of the matrix.

```

799 \int_compare:nNnTF \c@iRow = 0
800 {
801     \int_compare:nNnT \c@jCol > 0
802     {
803         \l_@@_code_for_first_row_tl
804         \xglobal \colorlet{nicematrix-first-row}{. .}
805     }
806 }
807 {
808     \int_compare:nNnT \c@iRow = \l_@@_last_row_int
809     {
810         \l_@@_code_for_last_row_tl
811         \xglobal \colorlet{nicematrix-last-row}{. .}
812     }
813 }
814 }
```

The following macro `\@@_begin_of_row` is usually used in the cell number 1 of the row. However, when the key `first-col` is used, `\@@_begin_of_row` is executed in the cell number 0 of the row.

```

815 \cs_new_protected:Npn \@@_begin_of_row:

```

The following computations are for the “first row” and the “last row”.

```

899     \@@_update_for_first_and_last_row:

```

If the cell is empty, or may be considered as if, we must not create the PGF node, for two reasons:

- it’s a waste of time since such a node would be rather pointless;
- we test the existence of these nodes in order to determine whether a cell is empty when we search the extremities of a dotted line.

However, it's very difficult to determine whether a cell is empty. As of now, we use the following technic:

- if the width of the box `\l_@@_cell_box` (created with the content of the cell) is equal to zero, we consider the cell as empty (however, this is not perfect since the user may have used a `\rlap`, a `\llap` or a `\mathclap` of `mathtools`).
- the cells with a command `\Ldots` or `\Cdots`, `\Vdots`, etc., should also be considered as empty; if `nullify-dots` is in force, there would be nothing to do (in this case the previous commands only write an instruction in a kind of `code-after`); however, if `nullify-dots` is not in force, a phantom of `\ldots`, `\cdots`, `\vdots` is inserted and its width is not equal to zero; that's why these commands raise a boolean `\g_@@_empty_cell_bool` and we begin by testing this boolean.

```

899 \bool_if:NTF \g_@@_empty_cell_bool
900   { \box_use_drop:N \l_@@_cell_box }
901   {
902     \bool_lazy_or:nnTF
903       \g_@@_not_empty_cell_bool
904       { \dim_compare_p:nNn { \box_wd:N \l_@@_cell_box } > \c_zero_dim }
905       \@@_node_for_the_cell:
906       { \box_use_drop:N \l_@@_cell_box }
907   }
908 \bool_gset_false:N \g_@@_empty_cell_bool
909 \bool_gset_false:N \g_@@_not_empty_cell_bool
910 }
```

The following command creates the PGF name of the node with, of course, `\l_@@_cell_box` as the content.

```

911 \cs_new_protected:Npn \@@_node_for_the_cell:
912 {
913   \pgfpicture
914   \pgfsetbaseline \c_zero_dim
915   \pgfrememberpicturepositiononpagetrue
916   \pgfset
917   {
918     inner_sep = \c_zero_dim ,
919     minimum_width = \c_zero_dim
920   }
921   \pgfnode
922   { rectangle }
923   { base }
924   { \box_use_drop:N \l_@@_cell_box }
925   { \@@_env: - \int_use:N \c@iRow - \int_use:N \c@jCol }
926   { }
927   \str_if_empty:NF \l_@@_name_str
928   {

931     { \@@_env: - \int_use:N \c@iRow - \int_use:N \c@jCol }
932   }
933   \endpgfpicture
934 }
```

The second argument of the following command `\@@_instruction_of_type:nnn` defined below is the type of the instruction (`Cdots`, `Vdots`, `Ddots`, etc.). The third argument is the list of options. This command writes in the corresponding `\g_@@_type_lines_tl` the instruction which will actually draw the line after the construction of the matrix.

For example, for the following matrix,

```
\begin{pNiceMatrix}
1 & 2 & 3 & 4 \\
5 & \Cdots & & 6 \\
7 & \Cdots [color=red]
\end{pNiceMatrix}
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 5 & \dots & & 6 \\ 7 & \dots & & \end{pmatrix}$$

the content of `\g_@@_Cdots_lines_tl` will be:

```
\@@_draw_Cdots:nnn {2}{2}{}
\@@_draw_Cdots:nnn {3}{2}{color=red}
```

The first argument is a boolean which indicates whether you must put the instruction on the left or on the right on the list of instructions.

```
935 \cs_new_protected:Npn \@@_instruction_of_type:nnn #1 #2 #3
936 {
```

It's important to use a `\tl_gput_right:c` and not a `\tl_gput_left:c` because we want the `\Ddots` lines to be drawn in the order of appearance in the array (for parallelisation).

```
937 \bool_if:nTF { #1 } \tl_gput_left:c \tl_gput_right:c
938   { g_@@_ #2 _ lines _ tl }
939   {
940     \use:c { @@_ draw _ #2 : nnn }
941     { \int_use:N \c@iRow }
942     { \int_use:N \c@jCol }
943     { \exp_not:n { #3 } }
944   }
945 }
```

We want to use `\array` of `array`. However, if the class used is `revtex4-1` or `revtex4-2`, we have to do some tuning and use the command `\@array@array` instead of `\array` because these classes do a redefinition of `\array` incompatible with our use of `\array`.

```
946 \cs_new_protected:Npn \@@_revtex_array:
947 {
948   \cs_set_eq:NN \acoll \arrayacol
949   \cs_set_eq:NN \acolr \arrayacol

```

The following code `\@@_pre_array:` is used in `{NiceArrayWithDelims}`. It exists as a standalone macro only for legibility.

```

1037 \cs_new_protected:Npn \@@_pre_array:
1038 {

```

If `booktabs` is loaded, we have to patch the macro `\@BTnormal` which is a macro of `booktabs`. The macro `\@BTnormal` draws an horizontal rule but it occurs after a vertical skip done by a low level TeX command. When this macro `\@BTnormal` occurs, the `row` node has yet been inserted by `nicematrix` *before* the vertical skip (and thus, at a wrong place). That why we decide to create a new `row` node (for the same row). We patch the macro `\@BTnormal` to create this `row` node. This new `row` node will overwrite the previous definition of that `row` node and we have managed to avoid the error messages of that redefinition ⁴⁰.

```

1039 \bool_if:NT \c_@@_booktabs_loaded_bool
1040     { \tl_put_left:Nn \@BTnormal \@@_create_row_node: }
1041 \box_clear_new:N \l_@@_cell_box

1045 \cs_if_exist:NT \thejCol
1046     { \int_set_eq:NN \l_@@_old_jCol_int \c@jCol }
1047 \int_gzero_new:N \c@jCol
1048 \normalbaselines

```

If the option `small` is used, we have to do some tuning. In particular, we change the value of `\arraystretch` (this parameter is used in the construction of `\@arstrutbox` in the beginning of `{array}`).

```

1049 \bool_if:NT \l_@@_small_bool
1050 {
1051     \cs_set_nopar:Npn \arraystretch { 0.47 }
1052     \dim_set:Nn \arraycolsep { 1.45 pt }
1053 }

```

⁴⁰cf. `\nicematrix@redefine@check@rerun`

The environment `{array}` uses internally the command `\ialign`. We change the definition of `\ialign` for several reasons. In particular, `\ialign` sets `\everycr` to `{ }` and we *need* to have to change the value of `\everycr`.

```

1054 \cs_set_nopar:Npn \ialign
1055 {
1056     \bool_if:NTF \c_@@_colortbl_loaded_bool
1057     {
1058         \CT@everycr
1059         {
1060             \noalign { \cs_gset_eq:NN \CT@row@color \prg_do_nothing: }
1061             \c_@@_everycr:
1062         }
1063     }
1064     { \everycr { \c_@@_everycr: } }
1065     \tabskip = \c_zero_skip

```

The box `\@arstrutbox` is a box constructed in the beginning of the environment `{array}`. The construction of that box takes into account the current value of `\arraystretch`^{41 and `\extrarowheight` (of `array`). That box is inserted (via `\@arstrut`) in the beginning of each row of the array. That's why we use the dimensions of that box to initialize the variables which will be the dimensions of the potential first and last row of the environment. This initialization must be done after the creation of `\@arstrutbox` and that's why we do it in the `\ialign`.}

```

1066     \dim_gzero_new:N \g_@@_dp_row_zero_dim
1067     \dim_gset:Nn \g_@@_dp_row_zero_dim { \box_dp:N \@arstrutbox }

```

The command `\CT@arc@` contains the instruction of color for the rules of the array⁴². This command is used by `\CT@arc@` but we use it also for compatibility with `colortbl`. But we want also to be able to use color for the rules of the array when `colortbl` is *not* loaded. That's why we do the following instruction which is in the patch of the beginning of arrays done by `colortbl`. Of course, we restore the value of `\CT@arc@` at the end of our environment.

```
1144 \cs_gset_eq:NN \@@_old_CT@arc@ \CT@arc@
```

We deactivate Tikz externalization because we will use PGF pictures with the options `overlay` and `remember picture` (or equivalent forms). We deactivate with `\tikzexternalisable` and not with `\tikzset{external/export=false}` which is *not* equivalent.

```

1145 \cs_if_exist:NT \tikz@library@external@loaded
1146 {
1147     \tikzexternalisable
1148     \cs_if_exist:NT \ifstandalone
1149         { \tikzset { external / optimize = false } }
1150 }
```

We increment the counter `\g_@@_env_int` which counts the environments of the package.

```

1151 \int_gincr:N \g_@@_env_int
1152 \bool_if:NF \l_@@_block_auto_columns_width_bool
1153     { \dim_gzero_new:N \g_@@_max_cell_width_dim }
```

The sequence `\g_@@_blocks_seq` will contain the carateristics of the blocks (specified by `\Block`) of the array. The sequence `\g_@@_pos_of_blocks_seq` will contain only the position of the blocks. Of course, this is redundant but it's for efficiency.

```

1154 \seq_gclear:N \g_@@_blocks_seq
1155 \seq_gclear:N \g_@@_pos_of_blocks_seq
```

In fact, the sequence `\g_@@_pos_of_blocks_seq` will also contain the positions of the cells with a `\diagbox`.

```

1156 \seq_gclear:N \g_@@_pos_of_stroken_blocks_seq
1157 \seq_gclear:N \g_@@_pos_of_xdots_seq
1158 \tl_if_exist:cT { g_@@_code_before_ \int_use:N \g_@@_env_int _ tl }
1159 {
1160     \bool_set_true:N \l_@@_code_before_bool
1161     \exp_args:NNv \tl_put_right:Nn \l_@@_code_before_tl
1162         { g_@@_code_before_ \int_use:N \g_@@_env_int _ tl }
1163 }
```

The set of keys is not exactly the same for `{NiceArray}` and for the variants of `{NiceArray}` (`{pNiceArray}`, `{bNiceArray}`, etc.) because, for `{NiceArray}`, we have the options `t`, `c`, `b` and `baseline`.

```

1164 \bool_if:NTF \l_@@_NiceArray_bool
1165     { \keys_set:nn { NiceMatrix / NiceArray } }
1166     { \keys_set:nn { NiceMatrix / pNiceArray } }
1167 { #3 , #5 }
```

⁴²e.g. `\color[rgb]{0.5,0.5,0}`

```

1168 \tl_if_empty:NF \l_@@_rules_color_tl
1169   { \exp_after:wN \@@_set_Carc@: \l_@@_rules_color_tl \q_stop }

```

If the key `code-before` is used, we have to create the `col` nodes and the `row` nodes before the creation of the array. First, we have to test whether the size of the array has been written in the `aux` file in a previous run. In this case, a command `\@@_size_nb_of_env:` has been created.

```

1170 \bool_if:NT \l_@@_code_before_bool
1171   {
1172     \seq_if_exist:cT { \@@_size_ \int_use:N \g_@@_env_int _ seq }
1173   }

```

First, we give values to the LaTeX counters `iRow` and `jCol`. We remind that, in the `code-before` (and in the `code-after`) they represent the numbers of rows and columns of the array (without the potential last row and last column).

```

1174 \int_zero_new:N \c@iRow
1175 \int_set:Nn \c@iRow
1176   { \seq_item:cn { \@@_size_ \int_use:N \g_@@_env_int _ seq } 2 }
1177 \int_zero_new:N \c@jCol
1178 \int_set:Nn \c@jCol
1179   { \seq_item:cn { \@@_size_ \int_use:N \g_@@_env_int _ seq } 4 }

```

We have to adjust the values of `\c@iRow` and `\c@jCol` to take into account the potential last row and last column. A value of `-2` for `\l_@@_last_row_int` means that there is no last row. Idem for the columns.

```

1180 \int_compare:nNnF \l_@@_last_row_int = { -2 }
1181   { \int_decr:N \c@iRow }
1182 \int_compare:nNnF \l_@@_last_col_int = { -2 }
1183   { \int_decr:N \c@jCol }

```

Now, we will create all the `col` nodes and `row` nodes with the informations written in the `aux` file. You use the technique described in the page 1229 of `pgfmanual.pdf`, version 3.1.4b.

```

1184 \pgfsys@markposition { \@@_env: - position }
1185 \pgfsys@getposition { \@@_env: - position } \@@_picture_position:
1186 \pgfpicture

```

First, the creation of the `row` nodes.

```

1187 \int_step_inline:nnn
1188   { \seq_item:cn { \@@_size_ \int_use:N \g_@@_env_int _ seq } 1 }
1189   { \seq_item:cn { \@@_size_ \int_use:N \g_@@_env_int _ seq } 2 + 1 }
1190   {
1191     \pgfsys@getposition { \@@_env: - row - ##1 } \@@_node_position:
1192     \pgfcoordinate { \@@_env: - row - ##1 }
1193       { \pgfpointdiff \@@_picture_position: \@@_node_position: }
1194   }

```

Now, the creation of the `col` nodes.

```

1195 \int_step_inline:nnn

1273 }
```

The code in `\@@_pre_array:` is used only by `{NiceArrayWithDelims}`.

```
1274 \@@_pre_array:
```

We compute the width of both delimiters.

```

1275 \dim_zero_new:N \l_@@_left_delim_dim
1276 \dim_zero_new:N \l_@@_right_delim_dim
1277 \bool_if:NTF \l_@@_NiceArray_bool
1278     {
1279         \dim_gset:Nn \l_@@_left_delim_dim { 2 \arraycolsep }
1280         \dim_gset:Nn \l_@@_right_delim_dim { 2 \arraycolsep }
1281     }
1282 }
```

The command `\bBigg@` is a command of `amsmath`.

```

1283 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \l_@@_left_delim_tl $ }
1284 \dim_set:Nn \l_@@_left_delim_dim { \box_wd:N \l_tmpa_box }
1285 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \l_@@_right_delim_tl $ }
1286 \dim_set:Nn \l_@@_right_delim_dim { \box_wd:N \l_tmpa_box }
1287 }
```

The array will be composed in a box (named `\l_@@_the_array_box`) because we have to do manipulations concerning the potential exterior rows.

```
1288 \box_clear_new:N \l_@@_the_array_box
```

If the user has loaded `nicematrix` with the option `define-L-C-R`, he will be able to use `L`, `C` and `R` instead of `l`, `c` and `r` in the preambles of the environments of `nicematrix` (it's a compatibility mode since `L`, `C` and `R` were mandatory before version 5.0).

```
1289 \bool_if:NT \c_@@_define_L_C_R_bool \@@_define_L_C_R:
```

The preamble will be constructed in `\g_@@_preamble_tl`.

```
1290 \@@_construct_preamble:
```

Now, the preamble is constructed in `\g_@@_preamble_tl`

Here is the beginning of the box which will contain the array. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the second part of the environment (and the closing `\c_math_toggle_token` also).

```

1291 \hbox_set:Nw \l_@@_the_array_box
1292 \skip_horizontal:N \l_@@_left_margin_dim
1293 \skip_horizontal:N \l_@@_extra_left_margin_dim
1294 \c_math_toggle_token
1295 \bool_if:NTF \l_@@_light_syntax_bool
1296     { \use:c { @@-light-syntax } }
1297     { \use:c { @@-normal-syntax } }
1298 }
1299 {
1300 \bool_if:NTF \l_@@_light_syntax_bool
1301     { \use:c { end @@-light-syntax } }
1302     { \use:c { end @@-normal-syntax } }
1303 \c_math_toggle_token
1304 \skip_horizontal:N \l_@@_right_margin_dim
1305 \skip_horizontal:N \l_@@_extra_right_margin_dim
1306 \hbox_set_end:
```

End of the construction of the array (in the box `\l_@@_the_array_box`).

If the user has used the key `last-row` with a value, we control that the given value is correct (since we have just constructed the array, we know the real number of rows of the array).

```

1307 \int_compare:nNnT \l_@@_last_row_int > { -2 }
1308 {
1309     \bool_if:NF \l_@@_last_row_without_value_bool
1310     {
1311         \int_compare:nNnF \l_@@_last_row_int = \c@iRow
1312         {
1313             \o@_error:n { Wrong~last~row }
1314             \int_gset_eq:NN \l_@@_last_row_int \c@iRow
1315         }
1316     }
1317 }
```

Now, the definition of `\c@jCol` and `\g_@@_col_total_int` change: `\c@jCol` will be the number of columns without the “last column”; `\g_@@_col_total_int` will be the number of columns with this “last column”.⁴³

```

1318 \int_gset_eq:NN \c@jCol \g_@@_col_total_int
1319 \bool_if:nTF \g_@@_last_col_found_bool
1320     { \int_gdecr:N \c@jCol }
1321     {
1322         \int_compare:nNnT \l_@@_last_col_int > { -1 }
1323         { \o@_error:n { last~col~not~used } }
1324     }
```

We fix also the value of `\c@iRow` and `\g_@@_row_total_int` with the same principle.

```

1325 \int_gset_eq:NN \g_@@_row_total_int \c@iRow
1326 \int_compare:nNnT \l_@@_last_row_int > { -1 } { \int_gdecr:N \c@iRow }
```

Now, we begin the real construction in the output flow of TeX. First, we take into account a potential “first column” (we remind that this “first column” has been constructed in an overlapping position and that we have computed its width in `\g_@@_width_first_col_dim`: see p. 97).

```

1327 \int_compare:nNnT \l_@@_first_col_int = 0
1328 {
1329     \skip_horizontal:N \col@sep
1330     \skip_horizontal:N \g_@@_width_first_col_dim
1331 }
```

The construction of the real box is different when `\l_@@_NiceArray_bool` is true (`{NiceArray}` or `{NiceTabular}`) and in the other environments because, in `{NiceArray}` or `{NiceTabular}`, we have no delimiter to put (but we have tabular notes to put). We begin with this case.

Remark that, in all cases, `\o@_use_arraybox_with_notes_c` is used.

```

1332 \bool_if:NTF \l_@@_NiceArray_bool
1333 {
1334     \str_case:VnF \l_@@_baseline_tl
1335     {
1336         b \o@_use_arraybox_with_notes_b:
1337         c \o@_use_arraybox_with_notes_c:
1338     }
1339     \o@_use_arraybox_with_notes:
1340 }
```

Now, in the case of an environment `{pNiceArray}`, `{bNiceArray}`, etc. We compute `\l_tmpa_dim` which is the total height of the “first row” above the array (when the key `first-row` is used).

```

1341 {
1342     \int_compare:nNnTF \l_@@_first_row_int = 0
1343     {
1344         \dim_set_eq:NN \l_tmpa_dim \g_@@_dp_row_zero_dim
1345         \dim_add:Nn \l_tmpa_dim \g_@@_ht_row_zero_dim
1346     }
1347     { \dim_zero:N \l_tmpa_dim }
```

⁴³We remind that the potential “first column” (exterior) has the number 0.

We compute $\l_1_{tmpb_dim}$ which is the total height of the “last row” below the array (when the key `last-row` is used). A value of -2 for $\l_1_{@@_last_row_int}$ means that there is no “last row”.⁴⁴

```

1348 \int_compare:nNnTF \l_@@_last_row_int > { -2 }
1349 {
1350     \dim_set_eq:NN \l_1_tmpb_dim \g_@@_ht_last_row_dim
1351     \dim_add:Nn \l_1_tmpb_dim \g_@@_dp_last_row_dim
1352 }
1353 { \dim_zero:N \l_1_tmpb_dim }
1354 \hbox_set:Nn \l_1_tmpa_box
1355 {
1356     \c_math_toggle_token
1357     \tl_if_empty:NF \l_@@_delimiters_color_tl
1358         { \color { \l_@@_delimiters_color_tl } }
1359     \exp_after:wN \left \l_@@_left_delim_tl
1360     \vcenter
1361     {

```

We take into account the “first row” (we have previously computed its total height in $\l_1_{tmpa_dim}$). The `\hbox:n` (or `\hbox`) is necessary here.

```

1362 \skip_vertical:N -\l_1_tmpa_dim
1363 \hbox
1364 {
1365     \bool_if:NTF \l_@@_NiceTabular_bool
1366         { \skip_horizontal:N -\tabcolsep }
1367         { \skip_horizontal:N -\arraycolsep }
1368     \@@_use_arraybox_with_notes_c:
1369     \bool_if:NTF \l_@@_NiceTabular_bool
1370         { \skip_horizontal:N -\tabcolsep }
1371         { \skip_horizontal:N -\arraycolsep }
1372 }

```

We take into account the “last row” (we have previously computed its total height in $\l_1_{tmpb_dim}$).

```

1373 \skip_vertical:N -\l_1_tmpb_dim
1374 }
1375 \exp_after:wN \right \l_@@_right_delim_tl
1376 \c_math_toggle_token
1377 }

```

Now, the box $\l_1_{tmpa_box}$ is created with the correct delimiters.

We will put the box in the TeX flow. However, we have a small work to do when the option `max-delimiter-width` is used.

```

1378 \bool_if:NTF \l_@@_max_delimiter_width_bool
1379     { \@@_put_box_in_flow_bis:nn { #1 } { #2 } }
1380     \@@_put_box_in_flow:
1381 }

```

We take into account a potential “last column” (this “last column” has been constructed in an overlapping position and we have computed its width in $\g_@@_width_last_col_dim$: see p. 98).

```

1382 \bool_if:NT \g_@@_last_col_found_bool
1383 {
1384     \skip_horizontal:N \g_@@_width_last_col_dim
1385     \skip_horizontal:N \col@sep
1386 }
1387 \bool_if:NF \l_@@_Matrix_bool
1388 {
1389     \int_compare:nNnT \c@jCol < \g_@@_static_num_of_col_int
1390         { \@@_error:n { columns-not-used } }
1391     }
1392 \group_begin:
1393 \globaldefs = 1
1394 \@@_msg_redirect_name:nn { columns-not-used } { error }
1395 \group_end:

```

⁴⁴A value of -1 for $\l_1_{@@_last_row_int}$ means that there is a “last row” but the user have not set the value with the option `last row` (and we are in the first compilation).

```
1396     \@@_after_array:
```

The aim of the following `\egroup` (the corresponding `\bgroup` is, of course, at the beginning of the environment) is to be able to put an exposant to a matrix in a mathematical formula.

```
1397     \egroup
1398     \bool_if:NT \c_@@_footnote_bool \endsavenotes
1399 }
```

This is the end of the environment `{NiceArrayWithDelims}`.

We construct the preamble of the array

The transformation of the preamble is an operation in several steps.

The preamble given by the final use is in `\g_@@_preamble_tl` and the modified version will be stored in `\g_@@_preamble_t1` also.

```
1400 \cs_new_protected:Npn \@@_construct_preamble:
1401 {
```

First, we will do an “expansion” of the preamble with the tools of the package `array` itself. This “expansion” will expand all the constructions with `*` and with all column types (defined by the user or by various packages using `\newcolumntype`).

Since we use the tools of `array` to do this expansion, we will have a programmation which is not in the style of `expl3`.

We redefine the column types `w` and `W`. We use `\@@_newcolumntype` instead of `\newcolumntype` because we don’t want warnings for column types already defined. These redefinitions are in fact *protections* of the letters `w` and `W`. We don’t want these columns type expanded because we will do the patch ourselves after. We want to be able the standard column types `w` and `W` in potential `{tabular}` of `array` in some cells of our array. That’s why we do those redefinitions in a TeX group.

```
1402 \group_begin:
```

If we are in an environment without explicit preamble, we have nothing to do (excepted the treatment on both sides of the preamble which will be done at the end).

```
1403 \bool_if:NF \l_@@_Matrix_bool
1404 {
1405     \@@_newcolumntype w [ 2 ] { \@@_w: { ##1 } { ##2 } }
1406     \@@_newcolumntype W [ 2 ] { \@@_W: { ##1 } { ##2 } }
```

First, we have to store our preamble in the token register `\@temptokena` (those “token registers” are not supported by `expl3`).

```
1407 \exp_args:N \@temptokena \g_@@_preamble_t1
```

Initialisation of a flag used by `array` to detect the end of the expansion.

```
1408 \tempswattrue
```

The following line actually does the expansion (it’s has been copied from `array.sty`).

```
1409 \whilesw \if@tempswa \fi { \tempswafalse \the \NC@list }
```

Now, we have to “patch” that preamble by transforming some columns. We will insert in the TeX flow the preamble in its actual form (that is to say after the “expansion”) following by a marker `\q_stop` and we will consume these tokens constructing the (new form of the) preamble in `\g_@@_preamble_t1`. This is done recursively with the command `\@@_patch_preamble:n`. In the same time, we will count the columns with the counter `\c@jCol`.

```
1410 \int_gzero_new:N \c@jCol
1411 \bool_if:NTF \l_@@_vlines_bool
1412 {
1413     \tl_gset:Nn \g_@@_preamble_t1
1414     { ! { \skip_horizontal:N \arrayrulewidth } }
1415 }
1416 { \tl_gclear:N \g_@@_preamble_t1 }
```

The counter `\l_tmpa_int` will count the number of consecutive occurrences of the symbol `\`.

```
1417     \int_zero:N \l_tmpa_int
```

Now, we actually patch the preamble (and it is constructed in `\g_@@_preamble_tl`).

```
1418     \exp_after:wN \@@_patch_preamble:n \the \c_temptokena \q_stop
1419     \int_gset_eq:NN \g_@@_static_num_of_col_int \c@jCol
1420 }
```

Now, we replace `\columncolor` by `\@@_columncolor_preamble`.

```
1421     \bool_if:NT \l_@@_colortbl_like_bool
1422     {
1423         \regex_replace_all:NnN
1424             \c_@@_columncolor_regex
1425             { \c { @@_columncolor_preamble } }
1426             \g_@@_preamble_tl
1427     }
```

We complete the preamble with the potential “exterior columns”.

```
1428     \int_compare:nNnTF \l_@@_first_col_int = 0
1429     { \tl_gput_left:NV \g_@@_preamble_tl \c_@@_preamble_first_col_tl }
1430     {
1431         \bool_lazy_all:nT
1432         {
1433             \l_@@_NiceArray_bool
1434             { \bool_not_p:n \l_@@_NiceTabular_bool }
1435             { \bool_not_p:n \l_@@_vlines_bool }
1436             { \bool_not_p:n \l_@@_exterior_arraycolsep_bool }
1437         }
1438         { \tl_gput_left:Nn \g_@@_preamble_tl { @ { } } }
1439     }
1440     \int_compare:nNnTF \l_@@_last_col_int > { -1 }
1441     { \tl_gput_right:NV \g_@@_preamble_tl \c_@@_preamble_last_col_tl }
1442     {
1443         \bool_lazy_all:nT
1444         {
1445             \l_@@_NiceArray_bool
1446             { \bool_not_p:n \l_@@_NiceTabular_bool }
1447             { \bool_not_p:n \l_@@_vlines_bool }
1448             { \bool_not_p:n \l_@@_exterior_arraycolsep_bool }
1449         }
1450         { \tl_gput_right:Nn \g_@@_preamble_tl { @ { } } }
1451     }
```

We add a last column to raise a good error message when the user put more columns than allowed by its preamble. However, for technical reasons, it's not possible to do that in `{NiceTabular*}` (`\l_@@_tabular_width_dim=0pt`).

```
1452     \dim_compare:nNnT \l_@@_tabular_width_dim = \c_zero_dim
1453     {
1454         \tl_gput_right:Nn
1455             \g_@@_preamble_tl
1456             { > { \@@_error_too_much_cols: } 1 }
1457     }
```

Now, we have to close the TeX group which was opened for the redefinition of the columns of type `w` and `W`.

```
1458     \group_end:
1459 }
1460 \cs_new_protected:Npn \@@_patch_preamble:n #1

1837     \skip_horizontal:N -\l_@@_real_right_delim_dim
1838 }

```

The construction of the array in the environment `{NiceArrayWithDelims}` is, in fact, done by the environment `{@@-light-syntax}` or by the environment `{@@-normal-syntax}` (whether the option `light-syntax` is in force or not). When the key `light-syntax` is not used, the construction is a standard environment (and, thus, it's possible to use `verbatim` in the array).

```
1839 \NewDocumentEnvironment { @@-normal-syntax } { }
```

First, we test whether the environment is empty. If it is empty, we raise a fatal error (it's only a security). In order to detect whether it is empty, we test whether the next token is `\end` and, if it's the case, we test if this is the end of the environment (if it is not, an standard error will be raised by LaTeX for incorrect nested environments).

```

1840 {
1841     \peek_meaning_ignore_spaces:NTF \end \@@_analyze_end:Nn
1842     { \exp_args:NV \@@_array: \g_@@_preamble_tl }
1843 }
1844 {
1845     \@@_create_col_nodes:
1846     \endarray
1847 }

```

When the key `light-syntax` is in force, we use an environment which takes its whole body as an argument (with the specifier `b` of `xparse`).

```
1848 \NewDocumentEnvironment { @@-light-syntax } { b }
1849 {
```

First, we test whether the environment is empty. It's only a security. Of course, this test is more easy than the similar test for the “normal syntax” because we have the whole body of the environment in `#1`.

```

1850 \tl_if_empty:nT { #1 } { \@@_fatal:n { empty~environment } }
1851 \tl_map_inline:nn { #1 }
1852 {
1853     \str_if_eq:nnT { ##1 } { & }
1854     { \@@_fatal:n { ampersand-in-light-syntax } }
1855     \str_if_eq:nnT { ##1 } { \\ }
1856     { \@@_fatal:n { double-backslash-in-light-syntax } }
1857 }
```

Now, you extract the `code-after` of the body of the environment. Maybe, there is no command `\CodeAfter` in the body. That's why you put a marker `\CodeAfter` after #1. If there is yet a `\CodeAfter` in #1, this second (or third...) `\CodeAfter` will be caught in the value of `\g_nicematrix_code_after_tl`. That doesn't matter because `\CodeAfter` will be set to *no-op* before the execution of `\g_nicematrix_code_after_tl`.

```
1858     \@@_light_syntax_i #1 \CodeAfter \q_stop
1859 }
```

Now, the second part of the environment. It is empty. That's not surprising because we have caught the whole body of the environment with the specifier `b` provided by `xparse`.

```
1860 { }
1861 \cs_new_protected:Npn \@@_light_syntax_i #1\CodeAfter #2\q_stop
1862 {
1863     \tl_gput_right:Nn \g_nicematrix_code_after_tl { #2 }
```

The body of the array, which is stored in the argument #1, is now splitted into items (and *not* tokens).

```
1864 \seq_gclear_new:N \g_@@_rows_seq
1865 \tl_set_rescan:Nno \l_@@_end_of_row_tl { } \l_@@_end_of_row_tl
1866 \exp_args:NNV \seq_gset_split:Nnn \g_@@_rows_seq \l_@@_end_of_row_tl { #1 }
```

If the environment uses the option `last-row` without value (i.e. without saying the number of the rows), we have now the opportunity to know that value. We do it, and so, if the token list `\l_@@_code_for_last_row_tl` is not empty, we will use directly where it should be.

```
1867 \int_compare:nNnT \l_@@_last_row_int = { -1 }
1868     { \int_set:Nn \l_@@_last_row_int { \seq_count:N \g_@@_rows_seq } }
```

Here is the call to `\array` (we have a dedicated macro `\@@_array`: because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```
1869 \exp_args:NV \@@_array: \g_@@_preamble_tl
```

We need a global affectation because, when executing `\l_tmpa_tl`, we will exit the first cell of the array.

```
1870 \seq_gpop_left:NN \g_@@_rows_seq \l_tmpa_tl
1871 \exp_args:NV \@@_line_with_light_syntax_i:n \l_tmpa_tl
1872 \seq_map_function:NN \g_@@_rows_seq \@@_line_with_light_syntax:n
1873 \@@_create_col_nodes:
1874 \endarray
1875 }

1876 \cs_new_protected:Npn \@@_line_with_light_syntax:n #1

1883     \l_tmpa_tl
1884     \seq_map_inline:Nn \g_@@_cells_seq { & ##1 }
1885 }
```

The following command is used by the code which detects whether the environment is empty (we raise a fatal error in this case: it's only a security).

```
1886 \cs_new_protected:Npn \@@_analyze_end:Nn #1 #2
1887 {
1888     \str_if_eq:VnT \g_@@_name_env_str { #2 }
1889     { \@@_fatal:n { empty~environment } }
```

We reput in the stream the `\end{...}` we have extracted and the user will have an error for incorrect nested environments.

```
1890     \end { #2 }
1891 }
```

The command `\@@_create_col_nodes`: will construct a special last row. That last row is a false row used to create the `col` nodes and to fix the width of the columns (when the array is constructed with an option which specify the width of the columns).

```

1892 \cs_new:Npn \@@_create_col_nodes:

We compute in `\g_tmpa_skip` the common width of the columns (it's a skip and not a dimension). We use a global variable because we are in a cell of an `\halign` and because we have to use this variable in other cells (of the same row). The affectation of `\g_tmpa_skip`, like all the affectations, must be done after the `\omit` of the cell.

We give a default value for `\g_tmpa_skip` (`0 pt plus 1 fill`) but it will just after be erased by a fixed value in the concerned cases.

```

```

We write also the potential content of `\g_@@_pos_of_blocks_seq` (it will be useful if the commands `\rowcolors` is used with the key `respect-blocks`).

```
2261 \seq_gset_from_clist:cn
2262     { c_@@_pos_of_blocks_ \int_use:N \g_@@_env_int _ seq }
2263     { \seq_use:Nnnn \g_@@_pos_of_blocks_seq , , , }
2264 }
2265 \iow_now:Nn \mainaux \ExplSyntaxOff
2266 }
```

By default, the diagonal lines will be parallelized⁴⁵. There are two types of diagonals lines: the `\Ddots` diagonals and the `\Iddots` diagonals. We have to count both types in order to know whether a diagonal is the first of its type in the current `{NiceArray}` environment.

```
2267 \bool_if:NT \l_@@_parallelize_diags_bool
2268 {
2269     \int_gzero_new:N \g_@@_ddots_int
2270     \int_gzero_new:N \g_@@_iddots_int
```

The dimensions `\g_@@_delta_x_one_dim` and `\g_@@_delta_y_one_dim` will contain the Δ_x and Δ_y of the first `\Ddots` diagonal. We have to store these values in order to draw the others `\Ddots` diagonals parallel to the first one. Similarly `\g_@@_delta_x_two_dim` and `\g_@@_delta_y_two_dim` are the Δ_x and Δ_y of the first `\Iddots` diagonal.

```
2271     \dim_gzero_new:N \g_@@_delta_x_one_dim
2272     \dim_gzero_new:N \g_@@_delta_y_one_dim
2273     \dim_gzero_new:N \g_@@_delta_x_two_dim
2274     \dim_gzero_new:N \g_@@_delta_y_two_dim
2275 }
2276 \int_zero_new:N \l_@@_initial_i_int
2277 \int_zero_new:N \l_@@_initial_j_int
2278 \int_zero_new:N \l_@@_final_i_int
2279 \int_zero_new:N \l_@@_final_j_int
2280 \bool_set_false:N \l_@@_initial_open_bool
2281 \bool_set_false:N \l_@@_final_open_bool
```

If the option `small` is used, the values `\l_@@_radius_dim` and `\l_@@_inter_dots_dim` (used to draw the dotted lines created by `\hdottedline` and `\vdottedline` and also for all the other dotted lines when `line-style` is equal to `standard`, which is the initial value) are changed.

```
2282 \bool_if:NT \l_@@_small_bool
```

⁴⁵It's possible to use the option `parallelize-diags` to disable this parallelization.

```

2283     {
2284         \dim_set:Nn \l_@@_radius_dim { 0.37 pt }
2285         \dim_set:Nn \l_@@_inter_dots_dim { 0.25 em }

```

The dimension `\l_@@_xdots_shorten_dim` corresponds to the option `xdots/shorten` available to the user. That's why we give a new value according to the current value, and not an absolute value.

```

2286         \dim_set:Nn \l_@@_xdots_shorten_dim { 0.6 \l_@@_xdots_shorten_dim }
2287     }

```

Now, we actually draw the dotted lines (specified by `\Cdots`, `\Vdots`, etc.).

```
2288     \@@_draw_dotted_lines:
```

The following computes the “corners” (made up of empty cells) but if there is no corner to compute, it will do nothing.

```
2289     \@@_compute_corners:
```

The sequence `\g_@@_pos_of_blocks_seq` must be “adjusted” (for the case where the user have written something like `\Block{1-}`).

```
2290     \@@_adjust_pos_of_blocks_seq:
```

The following code is only for efficiency. We determine whether the potential horizontal and vertical rules are “complete”, that is to say drawn in the whole array. We are sure that all the rules will be complete when there is no block, no virtual block (determined by a command such as `\Cdots`, `\Vdots`, etc.) and no corners. In that case, we switch to a shortcut version of `\@@_vline_i:nn` and `\@@_hline:nn`.

```

2291     \bool_lazy_all:nT
2292     {
2293         { \seq_if_empty_p:N \g_@@_pos_of_blocks_seq }
2294         { \seq_if_empty_p:N \g_@@_pos_of_xdots_seq }
2295         { \seq_if_empty_p:N \l_@@_empty_corner_cells_seq }
2296     }
2297     {
2298         \cs_set_eq:NN \@@_vline_i:nn \@@_vline_i_complete:nn
2299         \cs_set_eq:NN \@@_hline_i:nn \@@_hline_i_complete:nn
2300     }
2301     \bool_if:NT \l_@@_hlines_bool \@@_draw_hlines:
2302     \bool_if:NT \l_@@_vlines_bool \@@_draw_vlines:
2303     \g_@@_internal_code_after_tl
2304     \tl_gclear:N \g_@@_internal_code_after_tl

```

Now, the `code-after`.

```

2305     \bool_if:NT \c_@@_tikz_loaded_bool
2306     {
2307         \tikzset
2308         {
2309             every_picture / .style =
2310             {
2311                 overlay ,
2312                 remember-picture ,
2313                 name-prefix = \@@_env: -
2314             }
2315         }
2316     }
2317     \cs_set_eq:NN \line \@@_line
2318     \cs_set_eq:NN \SubMatrix \@@_SubMatrix

```

When `light-syntax` is used, we insert systematically a `\CodeAfter` in the flow. Thus, it's possible to have two instructions `\CodeAfter` and the second may be in `\g_nicematrix_code_after_tl`. That's why we set `\Code-after` to be *no-op* now.

```
2319     \cs_set_eq:NN \CodeAfter \prg_do_nothing:
```

We clear the list of the names of the potential `\SubMatrix` that will appear in the `code-after` (unfortunately, that list has to be global).

```
2320 \seq_gclear:N \g_@@_submatrix_names_seq
```

And here's the `code-after`. Since the `code-after` may begin with an “argument” between square brackets of the options, we extract and treat that potential “argument” with the command `\@@_CodeAfter_keys::`.

```
2321 \exp_last_unbraced:NV \@@_CodeAfter_keys: \g_nicematrix_code_after_tl  
2322 \scan_stop:  
2323 \tl_gclear:N \g_nicematrix_code_after_tl  
2324 \group_end:
```

`\g_nicematrix_code_before_tl` is for instructions in the cells of the array such as `\rowcolor` and `\cellcolor` (when the key `colortbl-like` is in force). These instructions will be written on the `aux` file to be added to the `code-before` in the next run.

```
2325 \tl_if_empty:NF \g_nicematrix_code_before_tl  
2326 {
```

The command `\rowcolor` in tabular will in fact use `\rectanglecolor` in order to follow the behaviour of `\rowcolor` of `colortbl`. That's why there may be a command `\rectanglecolor` in `\g_nicematrix_code_before_tl`. In order to avoid an error during the expansion, we define a protected version of `\rectanglecolor`.

```
2327 \cs_set_protected:Npn \rectanglecolor { }  
2328 \cs_set_protected:Npn \columncolor { }  
2329 \iow_now:Nn \mainaux \ExplSyntaxOn  
2330 \iow_now:Nx \mainaux

2333 { g_@@_code_before_ \int_use:N \g_@@_env_int _ tl }  
2334 { \exp_not:V \g_nicematrix_code_before_tl }  
2335 }  
2336 \iow_now:Nn \mainaux \ExplSyntaxOff  
2337 \bool_set_true:N \l_@@_code_before_bool  
2338 }  
  
2339 \str_gclear:N \g_@@_name_env_str  
2340 \@@_restore_iRow_jCol:
```

The command `\CT@arc@` contains the instruction of color for the rules of the array⁴⁶. This command is used by `\CT@arc@` but we use it also for compatibility with `colortbl`. But we want also to be able to use color for the rules of the array when `colortbl` is *not* loaded. That's why we do the following instruction which is in the patch of the end of arrays done by `colortbl`.

```
2341 \cs_gset_eq:NN \CT@arc@ \@@_old_CT@arc@  
2342 }
```

The following command will extract the potential options (between square brackets) at the beginning of the `code-after` (that is to say, when `\CodeAfter` is used, the options of that “command” `\CodeAfter`).

```
2343 \NewDocumentCommand \@@_CodeAfter_keys: { O { } }  
2344 { \keys_set:nn { NiceMatrix / CodeAfter } { #1 } }
```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format $i-j$. However, the user is allowed to omit i or j (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_pos_of_blocks_seq` (and `\g_@@_blocks_seq`) as a number of rows (resp. columns) for the block equal to 100. It's possible, after the construction of the array, to replace these values by the correct ones (since we know the number of rows and columns of the array).

```
2345 \cs_new_protected:Npn \@@_adjust_pos_of_blocks_seq:  
2346 {  
2347 \seq_gset_map_x:NNn \g_@@_pos_of_blocks_seq \g_@@_pos_of_blocks_seq  
2348 { \@@_adjust_pos_of_blocks_seq_i:nnnn ##1 }  
2349 }
```

⁴⁶e.g. `\color[rgb]{0.5,0.5,0}`

The following command must *not* be protected.

```

2350 \cs_new:Npn \@@_adjust_pos_of_blocks_seq_i:nnnn #1 #2 #3 #4
2351 {
2352 { #1 }
2353 { #2 }
2354 {

We draw the dotted lines

A dotted line will be said *open* in one of its extremities when it stops on the edge of the matrix and *closed* otherwise. In the following matrix, the dotted line is closed on its left extremity and open on its right.

$$\begin{pmatrix} a+b+c & a+b & a \\ & \cdots & \cdots \\ a & a+b & a+b+c \end{pmatrix}$$

The command `\@@_find_extremities_of_line:nnnn` takes four arguments:

- the first argument is the row of the cell where the command was issued;

- the second argument is the column of the cell where the command was issued;
- the third argument is the x -value of the orientation vector of the line;
- the fourth argument is the y -value of the orientation vector of the line.

This command computes:

- $\backslash l_{@@initial_i_int}$ and $\backslash l_{@@initial_j_int}$ which are the coordinates of one extremity of the line;
- $\backslash l_{@@final_i_int}$ and $\backslash l_{@@final_j_int}$ which are the coordinates of the other extremity of the line;
- $\backslash l_{@@initial_open_bool}$ and $\backslash l_{@@final_open_bool}$ to indicate whether the extremities are open or not.

```
2390 \cs_new_protected:Npn \@@_find_extremities_of_line:n #1 #2 #3 #4
2391 {
```

First, we declare the current cell as “dotted” because we forbide intersections of dotted lines.

```
2392 \cs_set:cpn { @@ _ dotted _ #1 - #2 } { }
```

Initialization of variables.

```
2393 \int_set:Nn \l_@@initial_i_int { #1 }
2394 \int_set:Nn \l_@@initial_j_int { #2 }
2395 \int_set:Nn \l_@@final_i_int { #1 }
2396 \int_set:Nn \l_@@final_j_int { #2 }
```

We will do two loops: one when determinating the initial cell and the other when determinating the final cell. The boolean $\backslash l_{@@stop_loop_bool}$ will be used to control these loops. In the first loop, we search the “final” extremity of the line.

```
2397 \bool_set_false:N \l_@@stop_loop_bool
2398 \bool_do_until:Nn \l_@@stop_loop_bool
2399 {
2400     \int_add:Nn \l_@@final_i_int { #3 }
2401     \int_add:Nn \l_@@final_j_int { #4 }
```

We test if we are still in the matrix.

```

2452            { \bool_set_true:N \l_@@_stop_loop_bool }
```

If the case is empty, we declare that the cell as non-empty. Indeed, we will draw a dotted line and the cell will be on that dotted line. All the cells of a dotted line have to be marked as "dotted" because we don't want intersections between dotted lines. We recall that the research of the extremities of the lines are all done in the same TeX group (the group of the environnement), even though, when the extremities are found, each line is drawn in a TeX group that we will open for the options of the line.

```

2453    {

```

2672 \group_begin:
2673     \int_compare:nNnTF { #2 } = 0
2674     { \color { nicematrix-first-col } }
2675     {
2676         \int_compare:nNnT { #2 } = \l_@@_last_col_int
2677         { \color { nicematrix-last-col } }
2678     }
2679     \keys_set:nn { NiceMatrix / xdots } { #3 }
2680     \tl_if_empty:VF \l_@@_xdots_color_tl
2681     { \color { \l_@@_xdots_color_tl } }
2682     \@@_actually_draw_Vdots:
2683     \group_end:
2684 }
2685

```

The command `\@@_actually_draw_Vdots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool`.

The following function is also used by `\Vdotsfor`.

```

2686 \cs_new_protected:Npn \@@_actually_draw_Vdots:
2687 {

```

The boolean `\l_tmpa_bool` indicates whether the column is of type 1 or may be considered as if.

```

2688 \bool_set_false:N \l_tmpa_bool
2689 \bool_lazy_or:nnF \l_@@_initial_open_bool \l_@@_final_open_bool
2690 {
2691     \@@_set_initial_coords_from_anchor:n { south-west }
2692     \@@_set_final_coords_from_anchor:n { north-west }
2693     \bool_set:Nn \l_tmpa_bool
2694     { \dim_compare_p:nNn \l_@@_x_initial_dim = \l_@@_x_final_dim }
2695 }

```

Now, we try to determine whether the column is of type c or may be considered as if.

```

2696 \bool_if:NTF \l_@@_initial_open_bool
2697 {
2698     \@@_qpoint:n { row - \int_use:N \l_@@_initial_i_int }
2699     \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
2700 }
2701 { \@@_set_initial_coords_from_anchor:n { south } }
2702 \bool_if:NTF \l_@@_final_open_bool
2703 {
2704     \@@_qpoint:n { row - \@@_succ:n \l_@@_final_i_int }
2705     \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
2706 }
2707 { \@@_set_final_coords_from_anchor:n { north } }
2708 \bool_if:NTF \l_@@_initial_open_bool
2709 {
2710     \bool_if:NTF \l_@@_final_open_bool

```

```

2711 {
2712     \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
2713     \dim_set_eq:NN \l_tmpa_dim \pgf@x
2714     \@@_qpoint:n { col - \@@_succ:n \l_@@_initial_j_int }
2715     \dim_set:Nn \l_@@_x_initial_dim { ( \pgf@x + \l_tmpa_dim ) / 2 }
2716     \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim

```

We may think that the final user won't use a "last column" which contains only a command `\Vdots`. However, if the `\Vdots` is in fact used to draw, not a dotted line, but an arrow (to indicate the number of rows of the matrix), it may be really encountered.

```

2717 \int_compare:nNnT \l_@@_last_col_int > { -2 }
2718 {
2719     \int_compare:nNnT \l_@@_initial_j_int = \g_@@_col_total_int
2720     {
2721         \dim_set_eq:NN \l_tmpa_dim \l_@@_right_margin_dim
2722         \dim_add:Nn \l_tmpa_dim \l_@@_extra_right_margin_dim
2723         \dim_add:Nn \l_@@_x_initial_dim \l_tmpa_dim
2724         \dim_add:Nn \l_@@_x_final_dim \l_tmpa_dim
2725     }
2726 }
2727 {
2728     \dim_set_eq:NN \l_@@_x_initial_dim \l_@@_x_final_dim
2729 }
2730 {
2731     \bool_if:NTF \l_@@_final_open_bool
2732     { \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim }
2733 }

```

Now the case where both extremities are closed. The first conditional tests whether the column is of type c (C of `{NiceArray}`) or may be considered as if.

```

2734 \dim_compare:nNnf \l_@@_x_initial_dim = \l_@@_x_final_dim
2735 {
2736     \dim_set:Nn \l_@@_x_initial_dim
2737     {
2738         \bool_if:NTF \l_tmpa_bool \dim_min:nn \dim_max:nn
2739             \l_@@_x_initial_dim \l_@@_x_final_dim
2740     }
2741     \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
2742 }
2743 }
2744 }
2745 \@@_draw_line:
2746 }

```

For the diagonal lines, the situation is a bit more complicated because, by default, we parallelize the diagonals lines. The first diagonal line is drawn and then, all the other diagonal lines are drawn parallel to the first one.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

2747 \cs_new_protected:Npn \@@_draw_Ddots:nnn #1 #2 #3
2748 {
2749     \cs_if_free:cT { @_ dotted _ #1 - #2 }
2750     {
2751         \@@_find_extremities_of_line:nnnn { #1 } { #2 } 1 1

```

The previous command may have changed the current environment by marking some cells as "dotted", but, fortunately, it is outside the group for the options of the line.

```

2752 \group_begin:
2753     \keys_set:nn { NiceMatrix / xdots } { #3 }
2754     \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
2755     \@@_actually_draw_Ddots:
2756     \group_end:
2757 }
2758 }

```

The command `\@@_actually_draw_Ddots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
 - `\l_@@_initial_j_int`
 - `\l_@@_initial_open_bool`
 - `\l_@@_final_i_int`
 - `\l_@@_final_j_int`
 - `\l_@@_final_open_bool.`
- ```

2759 \cs_new_protected:Npn \@@_actually_draw_Ddots:
2760 {
2761 \bool_if:NTF \l_@@_initial_open_bool
2762 {
2763 \@@_qpoint:n { row - \int_use:N \l_@@_initial_i_int }
2764 \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
2765 \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
2766 \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
2767 }
2768 { \@@_set_initial_coords_from_anchor:n { south-east } }
2769 \bool_if:NTF \l_@@_final_open_bool
2770 {
2771 \@@_qpoint:n { row - \@@_succ:n \l_@@_final_i_int }
2772 \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
2773 \@@_qpoint:n { col - \@@_succ:n \l_@@_final_j_int }
2774 \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
2775 }
2776 { \@@_set_final_coords_from_anchor:n { north-west } }

```

We have retrieved the coordinates in the usual way (they are stored in `\l_@@_x_initial_dim`, etc.). If the parallelization of the diagonals is set, we will have (maybe) to adjust the fourth coordinate.

```

2777 \bool_if:NT \l_@@_parallelize_diags_bool
2778 {
2779 \int_gincr:N \g_@@_ddots_int

```

We test if the diagonal line is the first one (the counter `\g_@@_ddots_int` is created for this usage).

```
2780 \int_compare:nNnTF \g_@@_ddots_int = 1
```

If the diagonal line is the first one, we have no adjustment of the line to do but we store the  $\Delta_x$  and the  $\Delta_y$  of the line because these values will be used to draw the others diagonal lines parallels to the first one.

```

2781 {
2782 \dim_gset:Nn \g_@@_delta_x_one_dim
2783 { \l_@@_x_final_dim - \l_@@_x_initial_dim }
2784 \dim_gset:Nn \g_@@_delta_y_one_dim
2785 { \l_@@_y_final_dim - \l_@@_y_initial_dim }
2786 }
```

If the diagonal line is not the first one, we have to adjust the second extremity of the line by modifying the coordinate `\l_@@_x_initial_dim`.

```

2787 {
2788 \dim_set:Nn \l_@@_y_final_dim
2789 {
2790 \l_@@_y_initial_dim +
2791 (\l_@@_x_final_dim - \l_@@_x_initial_dim) *
2792 \dim_ratio:nn \g_@@_delta_y_one_dim \g_@@_delta_x_one_dim
2793 }
2794 }
2795 \@@_draw_line:
2796 }
```

We draw the \Iddots diagonals in the same way.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

2798 \cs_new_protected:Npn \@@_draw_Iddots:n #1 #2 #3

2847 \@@_draw_line:
2848 }
```

## The actual instructions for drawing the dotted line with Tikz

The command `\@@_draw_line:` should be used in a `{pgfpicture}`. It has six implicit arguments:

- `\l_@@_x_initial_dim`
- `\l_@@_y_initial_dim`
- `\l_@@_x_final_dim`
- `\l_@@_y_final_dim`
- `\l_@@_initial_open_bool`
- `\l_@@_final_open_bool`

```

2849 \cs_new_protected:Npn \@@_draw_line:
2850 {
2851 \pgfrememberpicturepositiononpage true
2852 \pgf@relevantforpicturesize false
2853 \tl_if_eq:NNTF \l_@@_xdots_line_style_tl \c_@@_standard_tl
2854 \@@_draw_standard_dotted_line:
2855 \@@_draw_non_standard_dotted_line:
2856 }
```

We have to do a special construction with `\exp_args:N` to be able to put in the list of options in the correct place in the Tikz instruction.

```

2857 \cs_new_protected:Npn \@@_draw_non_standard_dotted_line:
2858 {
2859 \begin{scope}
2860 \exp_args:N \@@_draw_non_standard_dotted_line:n
2861 { \l_@@_xdots_line_style_tl , \l_@@_xdots_color_tl }
2862 }
```

We have used the fact that, in PGF, un color name can be put directly in a list of options (that's why we have put direktdly `\l_@@_xdots_color_tl`).

The argument of `\@@_draw_non_standard_dotted_line:n` is, in fact, the list of options.

```

2863 \cs_new_protected:Npn \@@_draw_non_standard_dotted_line:n #1
2864 {
2865 \@@_draw_non_standard_dotted_line:nVV
2866 { #1 }
2867 \l_@@_xdots_up_tl
2868 \l_@@_xdots_down_tl
2869 }

2870 \cs_new_protected:Npn \@@_draw_non_standard_dotted_line:nnn #1 #2 #3
2871 {
2872 \draw
2873 [
2874 #1 ,
2875 shorten~> = \l_@@_xdots_shorten_dim ,
2876 shorten~< = \l_@@_xdots_shorten_dim ,
2877]
2878 (\l_@@_x_initial_dim , \l_@@_y_initial_dim)
```

Be careful: We can't put `\c_math_toggle_token` instead of \$ in the following lines because we are in the contents of Tikz nodes (and they will be *rescanned* if the Tikz library `babel` is loaded).

```

2879 -- node [sloped , above] { $ \scriptstyle #2 $ }
2880 node [sloped , below] { $ \scriptstyle #3 $ }
2881 (\l_@@_x_final_dim , \l_@@_y_final_dim) ;
2882 \end { scope }
2883 }
2884 \cs_generate_variant:Nn \@@_draw_non_standard_dotted_line:nnn { n V V }
```

The command `\@@_draw_standard_dotted_line:` draws the line with our system of points (which gives a dotted line with real round points).

```

2885 \cs_new_protected:Npn \@@_draw_standard_dotted_line:
2886 {
2887 \bool_lazy_and:nnF
2888 { \tl_if_empty_p:N \l_@@_xdots_up_tl }

2922 {
2923 \c_math_toggle_token
2924 \scriptstyle \l_@@_xdots_down_tl
2925 \c_math_toggle_token
2926 }
2927 { }
2928 { \pgfusepath { } }
2929 \endpgfscope
2930 }
2931 \group_begin:
2932 \dim_zero_new:N \l_@@_l_dim
2933 \dim_set:Nn \l_@@_l_dim
```

The dimension `\l_@@_l_dim` is the length  $\ell$  of the line to draw. We use the floating point reals of `expl3` to compute this length.

```

2932 \dim_zero_new:N \l_@@_l_dim
2933 \dim_set:Nn \l_@@_l_dim
```

```

2934 {
2935 \fp_to_dim:n
2936 {
2937 sqrt
2938 (
2939 (\l_@@x_final_dim - \l_@@x_initial_dim) ^ 2
2940 +
2941 (\l_@@y_final_dim - \l_@@y_initial_dim) ^ 2
2942)
2943 }
2944 }
```

It seems that, during the first compilations, the value of  $\l_@@l\_dim$  may be erroneous (equal to zero or very large). We must detect these cases because they would cause errors during the drawing of the dotted line. Maybe we should also write something in the aux file to say that one more compilation should be done.

```

## User commands available in the new environments

The commands `\@_Ldots`, `\@_Cdots`, `\@_Vdots`, `\@_Ddots` and `\@_Iddots` will be linked to `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots` and `\Iddots` in the environments `{NiceArray}` (the other environments of `nicematrix` rely upon `{NiceArray}`).

The starred versions of these commands are deprecated since version 3.1 but, as of now, they are still available with an error.

The syntax of these commands uses the character `_` as embellishment and that's why we have to insert a character `_` in the *arg spec* of these commands. However, we don't know the future catcode of `_` in the main document (maybe the user will use `underscore`, and, in that case, the catcode is 13 because `underscore` activates `_`). That's why these commands will be defined in a `\AtBeginDocument` and the *arg spec* will be rescanned.

```

3032 \AtBeginDocument
3033 {
3034 \tl_set:Nn \l_@@_argspec_tl { 0 { } E { _^ } { { } { } } }

3129 \bool_gset_true:N \g_@@_empty_cell_bool
3130 }
3131 }

```

End of the `\AtBeginDocument`.

Despite its name, the following set of keys will be used for `\Ddots` but also for `\Iddots`.

```

3132 \keys_define:nn { NiceMatrix / Ddots }
3133 {
3134 draw-first .bool_set:N = \l_@@_draw_first_bool ,
3135 draw-first .default:n = true ,
3136 draw-first .value_forbidden:n = true
3137 }

```

The command `\@@_Hspace:` will be linked to `\hspace` in `{NiceArray}`.

```

3138 \cs_new_protected:Npn \@@_Hspace:

```

```

3139 {
3140 \bool_gset_true:N \g_@@_empty_cell_bool
3141 \hskip
3142 }

```

In the environment `{NiceArray}`, the command `\multicolumn` will be linked to the following command `\@@_multicolumn:nnn`.

```

3143 \cs_set_eq:NN \@@_old_multicolumn \multicolumn
3144 \cs_new:Npn \@@_multicolumn:nnn #1 #2 #3
3145 {

```

We have to act in an expandable way since it will begin by a `\multicolumn`.

```

3146 \exp_args:NNe
3147 \@@_old_multicolumn
3148 { #1 }

```

We will have to replace `\tl_lower_case:n` in the future since it seems to be deprecated.

```

3149 {
3150 \exp_args:Nne \str_case:nn { \str_foldcase:n { #2 } }
3151 {
3152 l { > \@@_Cell: 1 < \@@_end_Cell: }
3153 r { > \@@_Cell: r < \@@_end_Cell: }
3154 c { > \@@_Cell: c < \@@_end_Cell: }
3155 { l | } { > \@@_Cell: 1 < \@@_end_Cell: | }
3156 { r | } { > \@@_Cell: r < \@@_end_Cell: | }
3157 { c | } { > \@@_Cell: c < \@@_end_Cell: | }
3158 { | l } { | > \@@_Cell: 1 < \@@_end_Cell: }
3159 { | r } { | > \@@_Cell: r < \@@_end_Cell: }
3160 { | c } { | > \@@_Cell: c < \@@_end_Cell: }
3161 { | l | } { | > \@@_Cell: 1 < \@@_end_Cell: | }
3162 { | r | } { | > \@@_Cell: r < \@@_end_Cell: | }
3163 { | c | } { | > \@@_Cell: c < \@@_end_Cell: | }
3164 }
3165 }
3166 { #3 }

```

The `\peek_remove_spaces:n` is mandatory.

```

3167 \peek_remove_spaces:n
3168 {
3169 \int_compare:nNnT #1 > 1
3170 {
3171 \seq_gput_left:Nx \g_@@_multicolumn_cells_seq
3172 { \int_use:N \c@iRow - \int_use:N \c@jCol }
3173 \seq_gput_left:Nn \g_@@_multicolumn_sizes_seq { #1 }
3174 \seq_gput_right:Nx \g_@@_pos_of_blocks_seq
3175 {
3176 \int_use:N \c@iRow
3177 \int_use:N \c@jCol
3178 \int_use:N \c@iRow
3179 \int_eval:n { \c@jCol + #1 - 1 }
3180 }
3181 }
3182 \int_gadd:Nn \c@jCol { #1 - 1 }
3183 \int_compare:nNnT \c@jCol > \g_@@_col_total_int
3184 { \int_gset_eq:NN \g_@@_col_total_int \c@jCol }
3185 }
3186 }

```

The command `\@@_Hdotsfor` will be linked to `\Hdotsfor` in `{NiceArrayWithDelims}`. Tikz nodes are created also in the implicit cells of the `\Hdotsfor` (maybe we should modify that point).

This command must *not* be protected since it begins with `\multicolumn`.

```

3187 \cs_new:Npn \@@_Hdotsfor:
3188 {

```

```

3189 \bool_lazy_and:nNTF
3190 { \int_compare_p:nNn \c@jCol = 0 }
3191 { \int_compare_p:nNn \l_@@_first_col_int = 0 }
3192 {
3193 \bool_if:NTF \g_@@_after_col_zero_bool
3194 {
3195 \multicolumn { 1 } { c } { }
3196 \@@_Hdotsfor_i
3197 }
3198 { \@@_fatal:n { Hdotsfor-in-col-0 } }
3199 }
3200 {
3201 \multicolumn { 1 } { c } { }
3202 \@@_Hdotsfor_i
3203 }
3204 }

```

The command `\@@_Hdotsfor_i` is defined with `\NewDocumentCommand` because it has an optional argument. Note that such a command defined by `\NewDocumentCommand` is protected and that's why we have put the `\multicolumn` before (in the definition of `\@@_Hdotsfor:`).

```

3205 \AtBeginDocument
3206 {
3207 \tl_set:Nn \l_@@_argspec_tl { 0 { } m 0 { } E { _ ^ } { { } { } } }
3208 \tl_set_rescan:Nno \l_@@_argspec_tl { } \l_@@_argspec_tl

```

We don't put ! before the last optionnal argument for homogeneity with `\Cdots`, etc. which have only one optional argument.

```

3209 \exp_args:NNV \NewDocumentCommand \@@_Hdotsfor_i \l_@@_argspec_tl
3210 {
3211 \tl_gput_right:Nx \g_@@_HVdotsfor_lines_tl

```

## The command `\line` accessible in code-after

In the `code-after`, the command `\@@_line:nn` will be linked to `\line`. This command takes two arguments which are the specifications of two cells in the array (in the format  $i-j$ ) and draws a dotted line between these cells.

First, we write a command with an argument of the format  $i-j$  and applies the command `\int_eval:n` to  $i$  and  $j$ ; this must *not* be protected (and is, of course fully expandable).<sup>47</sup>

```
3357 \cs_new:Npn \@@_double_int_eval:n #1-#2 \q_stop
3358 { \int_eval:n { #1 } - \int_eval:n { #2 } }
```

With the following construction, the command `\@@_double_int_eval:n` is applied to both arguments before the application of `\@@_line_i:nn` (the construction uses the fact the `\@@_line_i:nn` is protected and that `\@@_double_int_eval:n` is fully expandable).

```

3383 \cs_if_free_p:c { pgf @ sh @ ns @ \@@_env: - #1 }
3384 ||
3385 \cs_if_free_p:c { pgf @ sh @ ns @ \@@_env: - #2 }
3386 }
3387 {
3388 \@@_error:nnn { unknown-cell-for-line-in-code-after } { #1 } { #2 }
3389 }
}
```

---

<sup>47</sup>Indeed, we want that the user may use the command `\line` in `code-after` with LaTeX counters in the arguments — with the command `\value`.

```

3390 { \@@_draw_line_ii:nn { #1 } { #2 } }
3391 }
3392 \AtBeginDocument
3393 {
3394 \cs_new_protected:Npx \@@_draw_line_ii:nn #1 #2
3395 {

```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible” and that why we do this static construction of the command `\@@_draw_line_ii`:

```

3396 \c_@@_pgfortikzpicture_tl
3397 \@@_draw_line_iii:nn { #1 } { #2 }
3398 \c_@@_endpgfortikzpicture_tl
3399 }
3400 }

```

The following command *must* be protected (it’s used in the construction of `\@@_draw_line_ii:nn`).

```

3401 \cs_new_protected:Npn \@@_draw_line_iii:nn #1 #2
3402 {
3403 \pgfrememberpicturepositiononpage true
3404 \pgfpointshapeborder { \@@_env: - #1 } { \@@_qpoint:n { #2 } }
3405 \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
3406 \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
3407 \pgfpointshapeborder { \@@_env: - #2 } { \@@_qpoint:n { #1 } }
3408 \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
3409 \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
3410 \@@_draw_line:
3411 }

```

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Iddots` don’t use this command because they have to do other settings (for example, the diagonal lines must be parallelized).

## Colors of cells, rows and columns

We want to avoid the thin white lines that are shown in some PDF viewers (eg: with the engine MuPDF used by SumatraPDF). That’s why we try to draw rectangles of the same color in the same instruction `\pgfusepathqfill` (and they will be in the same instruction `fill`—coded `f`—in the resulting PDF).

The commands `\@@_rowcolor`, `\@@_columncolor` and `\@@_rectanglecolor` (which are linked to `\rowcolor`, `\columncolor` and `\rectanglecolor` before the execution of the `code-before`) don’t directly draw the corresponding rectangles. Instead, they store their instructions color by color:

- A sequence `\l_@@_colors_seq` will be built containing all the colors used by at least one of these instructions. Each *color* may be prefixed by its color model (eg: `[gray]{0.5}`).
- For the color whose index in `\l_@@_colors_seq` is equal to *i*, a list of instructions which use that color will be constructed in the token list `\l_@@_color_i_tl`. In that token list, the instructions will `\@@_rowcolor:n`, `\@@_columncolor:n` and `\@@_rectanglecolor:nn` (corresponding of `\rowcolor`, `\columncolor` and `\rectanglecolor`).

`bigskip #1` is the color and `#2` is an instruction using that color. Despite its name, the command `\@@_add_to_color_seq` doesn’t only add a color to `\l_@@_colors_seq`: it also updates the corresponding token list `\l_@@_color_i_tl`.

```

3412 \cs_new_protected:Npn \@@_add_to_colors_seq:nn #1 #2
3413 {

```

First, we look for the number of the color and, if it’s found, we store it in `\l_tmpa_int`. If the color is not present in `\l_@@_colors_seq`, `\l_tmpa_int` will remain equal to 0.

```

3414 \int_zero:N \l_tmpa_int
3415 \seq_map_indexed_inline:Nn \l_@@_colors_seq
3416 { \tl_if_eq:nnT { #1 } { #2 } { \int_set:Nn \l_tmpa_int { ##1 } } }
3417 \int_compare:nNnTF \l_tmpa_int = \c_zero_int

```

First, the case where the color is a *new* color (not in the sequence).

```

3418 {
3419 \seq_put_right:Nn \l_@@_colors_seq { #1 }
3420 \tl_set:cn { l_@@_color _ \seq_count:N \l_@@_colors_seq _ tl } { #2 }
3421 }
```

Now, the case where the color is *not* a new color (the color is in the sequence at the position `\l_tmpa_int`).

```

3422 { \tl_put_right:cn { l_@@_color _ \int_use:N \l_tmpa_int _ tl } { #2 } }
3423 }
3424 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { x n }
```

The macro `\@@_actually_color:` will actually fill all the rectangles, color by color (using the sequence `\l_@@_colors_seq` and all the token lists of the form `\l_@@_color_i_tl`).

```

3425 \cs_new_protected:Npn \@@_actually_color:

3682 { \exp_not:N \columncolor [#1] { #2 } { \int_use:N \c@jCol } }
3683 }
3684 }
```

## The vertical rules

We give to the user the possibility to define new types of columns (with `\newcolumntype` of `array`) for special vertical rules (*e.g.* rules thicker than the standard ones) which will not extend in the potential exterior rows of the array.

We provide the command `\OnlyMainNiceMatrix` in that goal. However, that command must be no-op outside the environments of `nicematrix` (and so the user will be allowed to use the same new type of column in the environments of `nicematrix` and in the standard environments of `array`).

That's why we provide first a global definition of `\OnlyMainNiceMatrix`.

```
3685 \cs_set_eq:NN \OnlyMainNiceMatrix \use:n
```

Another definition of `\OnlyMainNiceMatrix` will be linked to the command in the environments of `nicematrix`. Here is that definition, called `\@@_OnlyMainNiceMatrix:n`.

```

3686 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix:n #1

3690 {
3691 \int_compare:nNnTF \c@jCol = 0
3692 {
```

```

3693 \int_compare:nNnF \c@iRow = { -1 }
3694 { \int_compare:nNnF \c@iRow = { \l_@@_last_row_int - 1 } { #1 } }
3695 }
3696 { \c@_OnlyMainNiceMatrix_i:n { #1 } }
3697 }
3698 }
```

This definition may seem complicated by we must remind that the number of row  $\c@iRow$  is incremented in the first cell of the row, *after* an potential vertical rule on the left side of the first cell.

The command  $\c@_OnlyMainNiceMatrix_i:n$  is only a short-cut which is used twice in the above command. This command must *not* be protected.

```

3699 \cs_new_protected:Npn \c@_OnlyMainNiceMatrix_i:n #1
3700 {
3701 \int_compare:nNnF \c@iRow = 0
3702 { \int_compare:nNnF \c@iRow = \l_@@_last_row_int { #1 } }
3703 }
```

Remember that  $\c@iRow$  is not always inferior to  $\l_@@_last_row_int$  because  $\l_@@_last_row_int$  may be equal to  $-2$  or  $-1$  (we can't write  $\int_compare:nNnT \c@iRow < \l_@@_last_row_int$ ).

The following command will be executed in the `internal-code-after`. The rule will be drawn *before* the column  $\#1$ .  $\#2$  is the number of consecutive occurrences of  $|$ .

```

3704 \cs_new_protected:Npn \c@_vline:nn #1 #2
3705 {
```

The following test is for the case where the user don't use all the columns specified in the preamble of the environment (for instance, a preamble of `|c|c|c|` but only two columns used).

```

3706 \int_compare:nNnT { #1 } < { \c@jCol + 2 }
3707 {
3708 \pgfpicture
3709 \c@_vline_i:nn { #1 } { #2 }
3710 \endpgfpicture
3711 }
3712 }
```

```

3713 \cs_new_protected:Npn \c@_vline_i:nn #1 #2
3714 {
```

$\l_tmpa_t1$  is the number of row and  $\l_tmpb_t1$  the number of column. When we have found a row corresponding to a rule to draw, we note its number in  $\l_tmpc_t1$ .

```

3715 \tl_set:Nx \l_tmpb_t1 { #1 }
3716 \tl_clear_new:N \l_tmpc_t1
3717 \int_step_variable:nNn \c@iRow \l_tmpa_t1

4025 { \@@_compute_a_corner:nnnnnn \c@iRow \c@jCol { -1 } { -1 } 1 1 }
4026 }
4027 { \@@_error:nn { bad-corner } { ##1 } }
4028 }
4029 }

```

“Computing a corner” is determining all the empty cells (which are not in a block) that belong to that corner. These cells will be added to the sequence `\l_@@_empty_corner_cells_seq`.

The six arguments of `\@@_compute_a_corner:nnnnnn` are as follow:

- #1 and #2 are the number of row and column of the cell which is actually in the corner;
- #3 and #4 are the steps in rows and the step in columns when moving from the corner;
- #5 is the number of the final row when scanning the rows from the corner;
- #6 is the number of the final column when scanning the columns from the corner.

```

4030 \cs_new_protected:Npn \@@_compute_a_corner:nnnnn #1 #2 #3 #4 #5 #6
4031 {

```

For the explanations and the name of the variables, we consider that we are computing the left-upper corner.

First, we try to determine which is the last empty cell (and not in a block: we won't add that precision any longer) in the column of number 1. The flag `\l_tmpa_bool` will be raised when a non-empty cell is found.

```

4032 \bool_set_false:N \l_tmpa_bool
4033 \int_zero_new:N \l_@@_last_empty_row_int
4034 \int_set:Nn \l_@@_last_empty_row_int { #1 }
4035 \int_step_inline:nnnn { #1 } { #3 } { #5 }
4036 {
4037 \@@_test_if_cell_in_a_block:nn { ##1 } { \int_eval:n { #2 } }
4038 \bool_lazy_or:nnTF
4039 {
4040 \cs_if_exist_p:c
4041 { pgf @ sh @ ns @ \@@_env: - ##1 - \int_eval:n { #2 } }
4042 }
4043 \l_tmpb_bool
4044 { \bool_set_true:N \l_tmpa_bool }
4045 {
4046 \bool_if:NF \l_tmpa_bool
4047 { \int_set:Nn \l_@@_last_empty_row_int { ##1 } }
4048 }
4049 }

```

Now, you determine the last empty cell in the row of number 1.

```

4050 \bool_set_false:N \l_tmpa_bool
4051 \int_zero_new:N \l_@@_last_empty_column_int
4052 \int_set:Nn \l_@@_last_empty_column_int { #2 }
4053 \int_step_inline:nnnn { #2 } { #4 } { #6 }
4054 {
4055 \@@_test_if_cell_in_a_block:nn { \int_eval:n { #1 } } { ##1 }
4056 \bool_lazy_or:nnTF
4057 \l_tmpb_bool
4058 {
4059 \cs_if_exist_p:c
4060 { pgf @ sh @ ns @ \@@_env: - \int_eval:n { #1 } - ##1 }
4061 }
4062 { \bool_set_true:N \l_tmpa_bool }

4111 }
4112 }
4113 }
4114 }

```

## The commands to draw dotted lines to separate columns and rows

These commands don't use the normal nodes, the medium nor the large nodes. They only use the `col` nodes and the `row` nodes.

### Horizontal dotted lines

The following command must *not* be protected because it's meant to be expanded in a `\noalign`.

```

4115 \cs_new:Npn \@@_hdottedline:
4116 {
4117 \noalign { \skip_vertical:N 2\l_@@_radius_dim }
4118 \@@_hdottedline_i:
4119 }

```

On the other side, the following command should be protected.

```

4120 \cs_new_protected:Npn \@@_hdottedline_i:
4121 {

```

We write in the code-after the instruction that will actually draw the dotted line. It's not possible to draw this dotted line now because we don't know the length of the line (we don't even know the number of columns).

```

4122 \tl_gput_right:Nx \g_@@_internal_code_after_tl
4123 { \@@_hdottedline:n { \int_use:N \c@iRow } }
4124 }

```

The command `\@@_hdottedline:n` is the command written in the `code-after` that will actually draw the dotted line. Its argument is the number of the row *before* which we will draw the row.

```
4125 \AtBeginDocument
4126 {
```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible”. That’s why we construct now a version of `\@@_hdottedline:n` with the right environment (`\begin{pgfpicture}\end{pgfpicture}` or `\begin{tikzpicture}...\end{tikzpicture}`).

```
4127 \cs_new_protected:Npx \@@_hdottedline:n #1
4128 {
4129 \bool_set_true:N \exp_not:N \l_@@_initial_open_bool
4130 \bool_set_true:N \exp_not:N \l_@@_final_open_bool
4131 \c_@@_pgfortikzpicture_tl
4132 \@@_hdottedline_i:n { #1 }
4133 \c_@@_endpgfortikzpicture_tl
4134 }
4135 }
```

The following command *must* be protected since it is used in the construction of `\@@_hdottedline:n`.

```
4136 \cs_new_protected:Npn \@@_hdottedline_i:n #1
4137 {
4138 \pgfrememberpicturepositiononpagetrue
4139 \@@_qpoint:n { row - #1 }
```

We do a translation par `- \l_@@_radius_dim` because we want the dotted line to have exactly the same position as a vertical rule drawn by “|” (considering the rule having a width equal to the diameter of the dots).

```
4140 \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
4141 \dim_sub:Nn \l_@@_y_initial_dim \l_@@_radius_dim
4142 \dim_set_eq:NN \l_@@_y_final_dim \l_@@_y_initial_dim
```

The dotted line will be extended if the user uses `margin` (or `left-margin` and `right-margin`).

The aim is that, by standard the dotted line fits between square brackets (`\hline` doesn’t).

```
\begin{bNiceMatrix}
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}
```

$$\begin{array}{cccc} 1 & 2 & 3 & 4 \\ \hline 1 & 2 & 3 & 4 \\ 1 & \dots & \dots & 4 \\ 1 & 2 & 3 & 4 \end{array}$$

But, if the user uses `margin`, the dotted line extends to have the same width as a `\hline`.

```
\begin{bNiceMatrix}[margin]
```

```
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}
```

$$\begin{array}{cccc} 1 & 2 & 3 & 4 \\ \hline 1 & 2 & 3 & 4 \\ \cdot & \cdot & \cdot & \cdot \\ 1 & 2 & 3 & 4 \end{array}$$

```
4143 \@@_qpoint:n { col - 1 }
4144 \dim_set:Nn \l_@@_x_initial_dim
4145 {
4146 \pgf@x +
```

We do a reduction by `\arraycolsep` for the environments with delimiters (and not for the other).

```
4147 \bool_if:NTF \l_@@_NiceArray_bool \c_zero_dim \arraycolsep
4148 - \l_@@_left_margin_dim
4149 }
4150 \@@_qpoint:n { col - \@@_succ:n \c@jCol }
4151 \dim_set:Nn \l_@@_x_final_dim
4152 {
4153 \pgf@x -
```

```

4154 \bool_if:NTF \l_@@_NiceArray_bool \c_zero_dim \arraycolsep
4155 + \l_@@_right_margin_dim
4156 }

```

For reasons purely aesthetic, we do an adjustment in the case of a rounded bracket. The correction by 0.5  $\l_@@_inter_dots_dim$  is *ad hoc* for a better result.

```

4157 \tl_set:Nn \l_tmpa_tl { (}
4158 \tl_if_eq:NNF \l_@@_left_delim_tl \l_tmpa_tl
4159 { \dim_gadd:Nn \l_@@_x_initial_dim { 0.5 \l_@@_inter_dots_dim } }
4160 \tl_set:Nn \l_tmpa_tl {) }
4161 \tl_if_eq:NNF \l_@@_right_delim_tl \l_tmpa_tl
4162 { \dim_gsub:Nn \l_@@_x_final_dim { 0.5 \l_@@_inter_dots_dim } }

```

As of now, we have no option to control the style of the lines drawn by `\hdottedline` and the specifier “`:`” in the preamble. That’s why we impose the style `standard`.

```

4163 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl
4164 \@@_draw_line:
4165 }

```

## Vertical dotted lines

```

4166 \cs_new_protected:Npn \@@_vdottedline:n #1
4167 {
4168 \bool_set_true:N \l_@@_initial_open_bool
4169 \bool_set_true:N \l_@@_final_open_bool

```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible”.

```

4170 \bool_if:NTF \c_@@_tikz_loaded_bool
4171 {
4172 \tikzpicture
4173 \@@_vdottedline_i:n { #1 }
4174 \endtikzpicture
4175 }
4176 {
4177 \pgfpicture
4178 \@@_vdottedline_i:n { #1 }
4179 \endpgfpicture
4180 }
4181 }

```

```

4182 \cs_new_protected:Npn \@@_vdottedline_i:n #1
4183 {

```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. The package `nicematrix` uses it even if `colortbl` is not loaded.

```

4184 \CT@arc@
4185 \pgfrememberpicturepositiononpagetrue
4186 \@@_qpoint:n { col - \int_eval:n { #1 + 1 } }

```

We do a translation par  $-\l_@@_radius_dim$  because we want the dotted line to have exactly the same position as a vertical rule drawn by “`|`” (considering the rule having a width equal to the diameter of the dots).

```

4187 \dim_set:Nn \l_@@_x_initial_dim { \pgf@x - \l_@@_radius_dim }
4188 \dim_set:Nn \l_@@_x_final_dim { \pgf@x - \l_@@_radius_dim }
4189 \@@_qpoint:n { row - 1 }

```

We arbitrary decrease the height of the dotted line by a quantity equal to  $\l_@@_inter_dots_dim$  in order to improve the visual impact.

```

4190 \dim_set:Nn \l_@@_y_initial_dim { \pgf@y - 0.5 \l_@@_inter_dots_dim }
4191 \@@_qpoint:n { row - \@@_succ:n \c@iRow }
4192 \dim_set:Nn \l_@@_y_final_dim { \pgf@y + 0.5 \l_@@_inter_dots_dim }

```

As of now, we have no option to control the style of the lines drawn by `\hdottedline` and the specifier “`:`” in the preamble. That’s why we impose the style `standard`.

```
4193 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl
4194 \@@_draw_line:
4195 }
```

## The environment `{NiceMatrixBlock}`

The following flag will be raised when all the columns of the environments of the block must have the same width in “auto” mode.

```
4196 \bool_new:N \l_@@_block_auto_columns_width_bool
```

As of now, there is only one option available for the environment `{NiceMatrixBlock}`.

```
4197 \keys_define:nn { NiceMatrix / NiceMatrixBlock }
4198 {
4199 auto-columns-width .code:n =
4200 {
4201 \bool_set_true:N \l_@@_block_auto_columns_width_bool
4202 \dim_gzero_new:N \g_@@_max_cell_width_dim
4203 \bool_set_true:N \l_@@_auto_columns_width_bool
4204 }
4205 }

4206 \NewDocumentEnvironment { NiceMatrixBlock } { ! O { } }
4207 {
4208 \int_gincr:N \g_@@_NiceMatrixBlock_int
4209 \dim_zero:N \l_@@_columns_width_dim
4210 \keys_set:nn { NiceMatrix / NiceMatrixBlock } { #1 }
4211 \bool_if:NT \l_@@_block_auto_columns_width_bool
4212 {
4213 \cs_if_exist:cT { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
4214 {
4215 \exp_args:NNc \dim_set:Nn \l_@@_columns_width_dim
4216 { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
4217 }
4218 }
4219 }
```

At the end of the environment `{NiceMatrixBlock}`, we write in the main `.aux` file instructions for the column width of all the environments of the block (that’s why we have stored the number of the first environment of the block in the counter `\l_@@_first_env_block_int`).

```
4220 {
4221 \bool_if:NT \l_@@_block_auto_columns_width_bool
4222 {
4223 \iow_shipout:Nn \@mainaux \ExplSyntaxOn
4224 \iow_shipout:Nx \@mainaux
4225 {
4226 \cs_gset:cpn
4227 { @@ _ max _ cell _ width _ \int_use:N \g_@@_NiceMatrixBlock_int }
4228 { \dim_eval:n { \g_@@_max_cell_width_dim + \arrayrulewidth } }
4229 }
4230 \iow_shipout:Nn \@mainaux \ExplSyntaxOff
4231 }
4232 }
```

For technical reasons, we have to include the width of a potential rule on the right side of the cells.

## The extra nodes

First, two variants of the functions `\dim_min:nn` and `\dim_max:nn`.

```
4233 \cs_generate_variant:Nn \dim_min:nn { v n }
4234 \cs_generate_variant:Nn \dim_max:nn { v n }
```

The following command is called in `\@@_use_arraybox_with_notes_c`: just before the construction of the blocks (if the creation of medium nodes is required, medium nodes are also created for the blocks dans that construction uses the standard medium nodes).

```
4235 \cs_new_protected:Npn \@@_create_extra_nodes:
4236 {
4237 \bool_if:nTF \l_@@_medium_nodes_bool
4238 {
4239 \bool_if:NTF \l_@@_large_nodes_bool
4240 \@@_create_medium_and_large_nodes:
4241 \@@_create_medium_nodes:
4242 }
4243 { \bool_if:NT \l_@@_large_nodes_bool \@@_create_large_nodes: }
4244 }
```

We have three macros of creation of nodes: `\@@_create_medium_nodes:`, `\@@_create_large_nodes:` and `\@@_create_medium_and_large_nodes:`.

We have to compute the mathematical coordinates of the “medium nodes”. These mathematical coordinates are also used to compute the mathematical coordinates of the “large nodes”. That’s why we write a command `\@@_computations_for_medium_nodes:` to do these computations.

The command `\@@_computations_for_medium_nodes:` must be used in a `{pgfpicture}`.

For each row  $i$ , we compute two dimensions  $l_{\text{@@}_\text{row\_}i\text{\_min\_dim}}$  and  $l_{\text{@@}_\text{row\_}i\text{\_max\_dim}}$ . The dimension  $l_{\text{@@}_\text{row\_}i\text{\_min\_dim}}$  is the minimal  $y$ -value of all the cells of the row  $i$ . The dimension  $l_{\text{@@}_\text{row\_}i\text{\_max\_dim}}$  is the maximal  $y$ -value of all the cells of the row  $i$ .

Similarly, for each column  $j$ , we compute two dimensions  $l_{\text{@@}_\text{column\_}j\text{\_min\_dim}}$  and  $l_{\text{@@}_\text{column\_}j\text{\_max\_dim}}$ . The dimension  $l_{\text{@@}_\text{column\_}j\text{\_min\_dim}}$  is the minimal  $x$ -value of all the cells of the column  $j$ . The dimension  $l_{\text{@@}_\text{column\_}j\text{\_max\_dim}}$  is the maximal  $x$ -value of all the cells of the column  $j$ .

Since these dimensions will be computed as maximum or minimum, we initialize them to `\c_max_dim` or `-\c_max_dim`.

```
4245 \cs_new_protected:Npn \@@_computations_for_medium_nodes:
4246 {
4247 \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
4248 {
4249 \dim_zero_new:c { l_@@_row_\@@_i: _min_dim }
4250 \dim_set_eq:cN { l_@@_row_\@@_i: _min_dim } \c_max_dim
4251 \dim_zero_new:c { l_@@_row_\@@_i: _max_dim }
4252 \dim_set:cn { l_@@_row_\@@_i: _max_dim } { - \c_max_dim }
4253 }
4254 \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
4255 {
4256 \dim_zero_new:c { l_@@_column_\@@_j: _min_dim }
4257 \dim_set_eq:cN { l_@@_column_\@@_j: _min_dim } \c_max_dim
4258 \dim_zero_new:c { l_@@_column_\@@_j: _max_dim }
4259 \dim_set:cn { l_@@_column_\@@_j: _max_dim } { - \c_max_dim }
4260 }
}
```

We begin the two nested loops over the rows and the columns of the array.

```
4261 \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
4262 {
4263 \int_step_variable:nnNn
4264 \l_@@_first_col_int \g_@@_col_total_int \@@_j:
```

If the cell  $(i-j)$  is empty or an implicit cell (that is to say a cell after implicit ampersands &) we don't update the dimensions we want to compute.

```
4265 {
4266 \cs_if_exist:cT
4267 { pgf @ sh @ ns @ \@@_env: - \@@_i: - \@@_j: }
```

We retrieve the coordinates of the anchor `south west` of the (normal) node of the cell  $(i-j)$ . They will be stored in `\pgf@x` and `\pgf@y`.

```
4268 {
4269 \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { south-west }
4270 \dim_set:cn { l_@@_row_\@@_i: _min_dim }
4271 { \dim_min:vn { l_@@_row _ \@@_i: _min_dim } \pgf@y }
4272 \seq_if_in:NxF \g_@@_multicolumn_cells_seq { \@@_i: - \@@_j: }
4273 {
4274 \dim_set:cn { l_@@_column _ \@@_j: _min_dim }
4275 { \dim_min:vn { l_@@_column _ \@@_j: _min_dim } \pgf@x }
4276 }
```

We retrieve the coordinates of the anchor `north east` of the (normal) node of the cell  $(i-j)$ . They will be stored in `\pgf@x` and `\pgf@y`.

```
4277 \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { north-east }
4278 \dim_set:cn { l_@@_row _ \@@_i: _ max_dim }
4279 { \dim_max:vn { l_@@_row _ \@@_i: _ max_dim } \pgf@y }
4280 \seq_if_in:NxF \g_@@_multicolumn_cells_seq { \@@_i: - \@@_j: }
4281 {
4282 \dim_set:cn { l_@@_column _ \@@_j: _ max_dim }
4283 { \dim_max:vn { l_@@_column _ \@@_j: _ max_dim } \pgf@x }
4284 }
4285 }
4286 }
```

Now, we have to deal with empty rows or empty columns since we don't have created nodes in such rows and columns.

```
4288 \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
4289 {
4290 \dim_compare:nNnT
4291 { \dim_use:c { l_@@_row _ \@@_i: _ min _ dim } } = \c_max_dim
4292 {
4293 \@@_qpoint:n { row - \@@_i: - base }
4294 \dim_set:cn { l_@@_row _ \@@_i: _ max _ dim } \pgf@y
4295 \dim_set:cn { l_@@_row _ \@@_i: _ min _ dim } \pgf@y
4296 }
4297 }
4298 \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
4299 {
4300 \dim_compare:nNnT
4301 { \dim_use:c { l_@@_column _ \@@_j: _ min _ dim } } = \c_max_dim
4302 {
4303 \@@_qpoint:n { col - \@@_j: }
4304 \dim_set:cn { l_@@_column _ \@@_j: _ max _ dim } \pgf@y
4305 \dim_set:cn { l_@@_column _ \@@_j: _ min _ dim } \pgf@y
4306 }
4307 }
4308 }
```

Here is the command `\@@_create_medium_nodes`. When this command is used, the “medium nodes” are created.

```
4309 \cs_new_protected:Npn \@@_create_medium_nodes:
4310 {
4311 \pgfpicture
4312 \pgfrememberpicturepositiononpagetrue
4313 \pgf@relevantforpicturesizefalse
4314 \@@_computations_for_medium_nodes:
```

Now, we can create the “medium nodes”. We use a command `\@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```
4315 \tl_set:Nn \l_@@_suffix_tl { -medium }
4316 \@_create_nodes:
4317 \endpgfpicture
4318 }
```

The command `\@_create_large_nodes:` must be used when we want to create only the “large nodes” and not the medium ones<sup>48</sup>. However, the computation of the mathematical coordinates of the “large nodes” needs the computation of the mathematical coordinates of the “medium nodes”. Hence, we use first `\@_computations_for_medium_nodes:` and then the command `\@_computations_for_large_nodes::`.

```
4319 \cs_new_protected:Npn \@_create_large_nodes:
4320 {
4321 \pgfpicture
4322 \pgfrememberpicturepositiononpagetrue
4323 \pgf@relevantforpicturesizefalse
4324 \@_computations_for_medium_nodes:
4325 \@_computations_for_large_nodes:
4326 \tl_set:Nn \l_@@_suffix_tl { - large }
4327 \@_create_nodes:
4328 \endpgfpicture
4329 }
4330 \cs_new_protected:Npn \@_create_medium_and_large_nodes:
4331 {
4332 \pgfpicture
4333 \pgfrememberpicturepositiononpagetrue
4334 \pgf@relevantforpicturesizefalse
4335 \@_computations_for_medium_nodes:
```

Now, we can create the “medium nodes”. We use a command `\@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```
4336 \tl_set:Nn \l_@@_suffix_tl { - medium }
4337 \@_create_nodes:
4338 \@_computations_for_large_nodes:
4339 \tl_set:Nn \l_@@_suffix_tl { - large }
4340 \@_create_nodes:
4341 \endpgfpicture
4342 }
```

For “large nodes”, the exterior rows and columns don’t interfer. That’s why the loop over the columns will start at 1 and stop at `\c@jCol` (and not `\g_@@_col_total_int`). Idem for the rows.

```
4343 \cs_new_protected:Npn \@_computations_for_large_nodes:
4344 {
4345 \int_set:Nn \l_@@_first_row_int 1
4346 \int_set:Nn \l_@@_first_col_int 1
```

We have to change the values of all the dimensions `l_@@_row_i_min_dim`, `l_@@_row_i_max_dim`, `l_@@_column_j_min_dim` and `l_@@_column_j_max_dim`.

```
4347 \int_step_variable:nNn { \c@iRow - 1 } \@_i:
4348 {
4349 \dim_set:cn { l_@@_row _ \@_i: _ min _ dim }
4350 {
4351 (
4352 \dim_use:c { l_@@_row _ \@_i: _ min _ dim } +
4353 \dim_use:c { l_@@_row _ \@@_succ:n \@_i: _ max _ dim }
4354)
4355 / 2
4356 }
4357 \dim_set_eq:cc { l_@@_row _ \@@_succ:n \@_i: _ max _ dim }
```

---

<sup>48</sup>If we want to create both, we have to use `\@_create_medium_and_large_nodes:`

```

4358 { l_@_row_@_i: _min_dim }
4359 }
4360 \int_step_variable:nNn { \c@jCol - 1 } @j:
4361 {
4362 \dim_set:cn { l_@_column_@_j: _max_dim }
4363 {
4364 (
4365 \dim_use:c { l_@_column_@_j: _max_dim } +
4366 \dim_use:c
4367 { l_@_column_@_succ:n \c@j: _min_dim }
4368)
4369 / 2
4370 }
4371 \dim_set_eq:cc { l_@_column_@_succ:n \c@j: _min_dim }
4372 { l_@_column_@_j: _max_dim }
4373 }

```

Here, we have to use `\dim_sub:cn` because of the number 1 in the name.

```

4374 \dim_sub:cn
4375 { l_@_column_1_min_dim }
4376 \l_@_left_margin_dim
4377 \dim_add:cn
4378 { l_@_column_@_int_use:N \c@jCol _max_dim }
4379 \l_@_right_margin_dim
4380 }

```

The command `\@_create_nodes:` is used twice: for the construction of the “medium nodes” and for the construction of the “large nodes”. The nodes are constructed with the value of all the dimensions `l_@_row_i_min_dim`, `l_@_row_i_max_dim`, `l_@_column_j_min_dim` and `l_@_column_j_max_dim`. Between the construction of the “medium nodes” and the “large nodes”, the values of these dimensions are changed.

The function also uses `\l_@_suffix_t1` (-medium or -large).

```

4381 \cs_new_protected:Npn @_create_nodes:
4382 {
4383 \int_step_variable:nnNn \l_@_first_row_int \g_@_row_total_int @_i:
4384 {
4385 \int_step_variable:nnNn \l_@_first_col_int \g_@_col_total_int @_j:
4386 }

```

We draw the rectangular node for the cell (`\@_i-\@_j`).

```

4387 @_pgf_rect_node:nnnnn
4388 { @_env: - @_i: - @_j: \l_@_suffix_t1 }
4389 { \dim_use:c { l_@_column_@_j: _min_dim } }
4390 { \dim_use:c { l_@_row_@_i: _min_dim } }
4391 { \dim_use:c { l_@_column_@_j: _max_dim } }
4392 { \dim_use:c { l_@_row_@_i: _max_dim } }
4393 \str_if_empty:NF \l_@_name_str
4394 {
4395 \pgfnodealias
4396 { \l_@_name_str - @_i: - @_j: \l_@_suffix_t1 }
4397 { @_env: - @_i: - @_j: \l_@_suffix_t1 }
4398 }
4399 }
4400 }

```

Now, we create the nodes for the cells of the `\multicolumn`. We recall that we have stored in `\g_@_multicolumn_cells_seq` the list of the cells where a `\multicolumn{n}{...}{...}` with  $n > 1$  was issued and in `\g_@_multicolumn_sizes_seq` the correspondant values of  $n$ .

```

4401 \seq_mapthread_function:NNN
4402 \g_@_multicolumn_cells_seq
4403 \g_@_multicolumn_sizes_seq
4404 @_node_for_multicolumn:nn
4405 }

```

```

4406 \cs_new_protected:Npn \@@_extract_coords_values: #1 - #2 \q_stop
4407 {
4408 \cs_set_nopar:Npn \@@_i: { #1 }
4409 \cs_set_nopar:Npn \@@_j: { #2 }
4410 }

```

The command `\@@_node_for_multicolumn:nn` takes two arguments. The first is the position of the cell where the command `\multicolumn{n}{...}{...}` was issued in the format  $i-j$  and the second is the value of  $n$  (the length of the “multi-cell”).

```

4411 \cs_new_protected:Npn \@@_node_for_multicolumn:nn #1 #2
4412 {
4413 \@@_extract_coords_values: #1 \q_stop
4414 \@@_pgf_rect_node:nnnn
4415 { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
4416 { \dim_use:c { l_@@_column _ \@@_j: _ min _ dim } }
4417 { \dim_use:c { l_@@_row _ \@@_i: _ min _ dim } }
4418 { \dim_use:c { l_@@_column _ \int_eval:n { \@@_j: +#2-1 } _ max _ dim } }
4419 { \dim_use:c { l_@@_row _ \@@_i: _ max _ dim } }
4420 \str_if_empty:NF \l_@@_name_str
4421 {
4422 \pgfnodealias
4423 { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
4424 { \int_use:N \g_@@_env_int - \@@_i: - \@@_j: \l_@@_suffix_tl}
4425 }
4426 }

```

## The blocks

The code deals with the command `\Block`. This command has no direct link with the environment `{NiceMatrixBlock}`.

The options of the command `\Block` will be analyzed first in the cell of the array (and once again when the block will be put in the array). Here is the set of keys for the first pass.

```

4427 \keys_define:nn { NiceMatrix / Block / FirstPass }
4428 {
4429 l .code:n = \tl_set:Nn \l_@@_pos_of_block_tl l ,
4430 l .value_forbidden:n = true ,
4431 r .code:n = \tl_set:Nn \l_@@_pos_of_block_tl r ,
4432 r .value_forbidden:n = true ,
4433 c .code:n = \tl_set:Nn \l_@@_pos_of_block_tl c ,
4434 c .value_forbidden:n = true ,

```

The two following lines will be uncommented when we will give to the key `color` its new definition.

```

4435 % color .tl_set:N = \l_@@_color_tl ,
4436 % color .value_required:n = true ,
4437 }

```

The following command `\@@_Block:` will be linked to `\Block` in the environments of `nicematrix`. We define it with `\NewExpandableDocumentCommand` because it has an optional argument between `<` and `>` (for TeX instructions put before the math mode of the label and before the beginning of the small array of the block). It’s mandatory to use an expandable command.

```

4438 \NewExpandableDocumentCommand \@@_Block: { O { } m D < > { } m }
4439 {

```

If the first mandatory argument of the command (which is the size of the block with the syntax  $i-j$ ) has not be provided by the user, you use `1-1` (that is to say a block of only one cell).

```

4440 \tl_if_blank:nTF { #2 } { \@@_Block_i 1-1 \q_stop } { \@@_Block_i #2 \q_stop }
4441 { #1 } { #3 } { #4 }
4442 }

```

With the following construction, we extract the values of  $i$  and  $j$  in the first mandatory argument of the command.

```
4443 \cs_new:Npn \@@_Block_i #1-#2 \q_stop { \@@_Block_ii:nnnnn { #1 } { #2 } }
```

Now, the arguments have been extracted: #1 is  $i$  (the number of rows of the block), #2 is  $j$  (the number of columns of the block), #3 is the list of key-values, #4 are the tokens to put before the math mode and the beginning of the small array of the block and #5 is the label of the block.

```
4444 \cs_new_protected:Npn \@@_Block_ii:nnnnn #1 #2 #3 #4 #5
4445 {
```

We recall that #1 and #2 have been extracted from the first mandatory argument of \Block (which is of the syntax  $i-j$ ). However, the user is allowed to omit  $i$  or  $j$  (or both). We detect that situation by replacing a missing value by 100 (it's a convention: when the block will actually be drawn these values will be detected and interpreted as *maximal possible value*).

```
4446 \bool_lazy_or:nnTF
4447 { \tl_if_blank_p:n { #1 } }
4448 { \str_if_eq_p:nn { #1 } { * } }
4449 { \int_set:Nn \l_tmpa_int { 100 } }
4450 { \int_set:Nn \l_tmpa_int { #1 } }

4451 \bool_lazy_or:nnTF
4452 { \tl_if_blank_p:n { #2 } }
4453 { \str_if_eq_p:nn { #2 } { * } }
4454 { \int_set:Nn \l_tmpb_int { 100 } }
4455 { \int_set:Nn \l_tmpb_int { #2 } }

4456 \int_compare:nNnTF \l_tmpb_int = 1
4457 {
4458 \tl_if_empty:NTF \l_@@_cell_type_tl
4459 { \tl_set:Nn \l_@@_pos_of_block_tl c }
4460 { \tl_set_eq:NN \l_@@_pos_of_block_tl \l_@@_cell_type_tl }
4461 }
4462 { \tl_set:Nn \l_@@_pos_of_block_tl c }

4463 \keys_set_known:nn { NiceMatrix / Block / FirstPass } { #3 }
4464 \tl_set:Nx \l_tmpa_tl
4465 {
4466 { \int_use:N \c@iRow }
4467 { \int_use:N \c@jCol }
4468 { \int_eval:n { \c@iRow + \l_tmpa_int - 1 } }
4469 { \int_eval:n { \c@jCol + \l_tmpb_int - 1 } }
4470 }
```

Now, `\l_tmpa_tl` contains an “object” corresponding to the position of the block with four components, each of them surrounded by curly brackets:

`{imin}{jmin}{imax}{jmax}`.

If the block is mono-column or mono-row, we have a special treatment. That's why we have two macros: `\@@_Block_iv:nnnnn` and `\@@_Block_v:nnnnn` (the five arguments of those macros are provided by curryfication).

```
4471 \bool_lazy_or:nnTF
4472 { \int_compare_p:nNn { \l_tmpa_int } = 1 }
4473 { \int_compare_p:nNn { \l_tmpb_int } = 1 }
4474 { \exp_args:Nxx \@@_Block_iv:nnnnn }
4475 { \exp_args:Nxx \@@_Block_v:nnnnn }
4476 { \l_tmpa_int } { \l_tmpb_int } { #3 } { #4 } { #5 }
4477 }
```

The following macro is for the case of a \Block which is mono-row or mono-column (or both). In that case, the content of the block is composed right now in a box (because we have to take into account the dimensions of that box for the width of the current column or the height and the depth of the current row). However, that box will be put in the array *after the construction of the array* (by using PGF).

```

4478 \cs_new_protected:Npn \@@_Block_iv:nnnnn #1 #2 #3 #4 #5
4479 {
4480 \int_gincr:N \g_@@_block_box_int
4481 \cs_set_protected_nopar:Npn \diagbox ##1 ##2
4482 {
4483 \tl_gput_right:Nx \g_@@_internal_code_after_tl
4484 {
4485 \g_@@_actually_diagbox:nnnnnn
4486 { \int_use:N \c@iRow }
4487 { \int_use:N \c@jCol }
4488 { \int_eval:n { \c@iRow + #1 - 1 } }
4489 { \int_eval:n { \c@jCol + #2 - 1 } }
4490 { \exp_not:n { ##1 } } { \exp_not:n { ##2 } }
4491 }
4492 }
4493 \box_gclear_new:c
4494 { g_@@_ block _ box _ \int_use:N \g_@@_block_box_int _ box }
4495 \hbox_gset:cn
4496 { g_@@_ block _ box _ \int_use:N \g_@@_block_box_int _ box }
4497 {

```

For a mono-column block, if the user has specified a color for the column in the preamble of the array, we want to fix that color in the box we construct. We do that with `\set@color` and not `\color_ensure_current`: because that command seems to be bugged: it doesn't work in XeLaTeX when `fontspec` is loaded.

```

4498 \tl_if_empty:NTF \l_@@_color_tl
4499 { \int_compare:nNnT { #2 } = 1 \set@color }
4500 { \color { \l_@@_color_tl } }
4501 \group_begin:
4502 \cs_set:Npn \arraystretch { 1 }
4503 \dim_set_eq:NN \extrarowheight \c_zero_dim
4504 #4

```

If the box is rotated (the key `\rotate` may be in the previous `#4`), the tabular used for the content of the cell will be constructed with a format `c`. In the other cases, the tabular will be constructed with a format equal to the key of position of the box. In other words: the alignment internal to the tabular is the same as the external alignment of the tabular (that is to say the position of the block in its zone of merged cells).

```

4505 \bool_if:NT \g_@@_rotate_bool { \tl_set:Nn \l_@@_pos_of_block_tl c }
4506 \bool_if:NTF \l_@@_NiceTabular_bool
4507 {
4508 \exp_args:Nnx \begin { tabular }
4509 { @ { } \l_@@_pos_of_block_tl @ { } }
4510 #5
4511 \end { tabular }
4512 }
4513 {
4514 \c_math_toggle_token
4515 \exp_args:Nnx \begin { array }

```

The integer `\l_@@_last_row_int` will be the last row of the block and `\l_@@_last_col_int` its last column.

```

4641 \int_zero_new:N \l_@@_last_row_int
4642 \int_zero_new:N \l_@@_last_col_int

```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format  $i-j$ . However, the user is allowed to omit  $i$  or  $j$  (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_blocks_seq` as a number of rows (resp. columns) for the block equal to 100. That's what we detect now.

```

```

Let's consider the following `\begin{NiceTabular}`. Because of the instruction `!{\hspace{1cm}}` in the preamble which increases the space between the columns (by adding, in fact, that space to the previous column, that is to say the second column of the tabular), we will create *two* nodes relative to the block: the node `1-1-block` and the node `1-1-block-short`. The latter will be used by `nicematrix` to put the label of the node. The first one won't be used explicitly.

```

\begin{NiceTabular}{cc!{\hspace{1cm}}c}
\Block{2-2}{our block} & & one \\
& & two \\
three & four & five \\
six & seven & eight \\
\end{NiceTabular}

```

We highlight the node `1-1-block`

|           |       |
|-----------|-------|
| our block | one   |
|           | two   |
| three     | four  |
| six       | seven |

We highlight the node `1-1-block-short`

|           |       |
|-----------|-------|
| our block | one   |
|           | two   |
| three     | four  |
| six       | seven |

The construction of the merged cells.

4977 }
4978 \cs_new_protected:Npn \@@_dotfill_i: { \group_insert_after:N \@@_dotfill_ii: }
4979 \cs_new_protected:Npn \@@_dotfill_ii: { \group_insert_after:N \@@_dotfill_iii: }
```

Now, if the box if not empty (unfortunately, we can't actually test whether the box is empty and that's why we only consider it's width), we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in the cell of the array, and it will extend, since it is no longer in `\l_@@_cell_box`.

```
4980 \cs_new_protected:Npn \@@_dotfill_iii:
4981 { \dim_compare:nNnT { \box_wd:N \l_@@_cell_box } = \c_zero_dim \@@_old_dotfill }
```

## The command \diagbox

The command `\diagbox` will be linked to `\diagbox:nn` in the environments of `nicematrix`.

```
4982 \cs_new_protected:Npn \@@_diagbox:nn #1 #2
4983 {
4984 \tl_gput_right:Nx \g_@@_internal_code_after_tl
4985 {
4986 \@@_actually_diagbox:nnnnnn
4987 { \int_use:N \c@iRow }
4988 { \int_use:N \c@jCol }
4989 { \int_use:N \c@iRow }
4990 { \int_use:N \c@jCol }
4991 { \exp_not:n { #1 } }
4992 { \exp_not:n { #2 } }
4993 }
```

We put the cell with `\diagbox` in the sequence `\g_@@_pos_of_blocks_seq` because a cell with `\diagbox` must be considered as non empty by the key `except-corners`.

```
4994 \seq_gput_right:Nx \g_@@_pos_of_blocks_seq
4995 {
4996 { \int_use:N \c@iRow }
4997 { \int_use:N \c@jCol }
4998 { \int_use:N \c@iRow }
4999 { \int_use:N \c@jCol }
5000 }
5001 }
```

The command `\diagbox` is also redefined locally when we draw a block.

The first four arguments of `\@@_actually_diagbox:nnnnnn` correspond to the rectangle (=block) to slash (we recall that it's possible to use `\diagbox` in a `\Block`). The two other are the elements to draw below and above the diagonal line.

```
5002 \cs_new_protected:Npn \@@_actually_diagbox:nnnnnn #1 #2 #3 #4 #5 #6
5003 {
5004 \pgfpicture
5005 \pgf@relevantforpicturesizefalse
5006 \pgfrememberpicturepositiononpagetrue
5007 \@@_qpoint:n { row - #1 }
5008 \dim_set_eq:NN \l_tmpa_dim \pgf@y
5009 \@@_qpoint:n { col - #2 }
5010 \dim_set_eq:NN \l_tmpb_dim \pgf@x
5011 \pgfpathmoveto { \pgfpoint \l_tmpb_dim \l_tmpa_dim }
```

```

5012 \@@_qpoint:n { row - \@@_succ:n { #3 } }
5013 \dim_set_eq:NN \l_tmpc_dim \pgf@y
5014 \@@_qpoint:n { col - \@@_succ:n { #4 } }
5015 \dim_set_eq:NN \l_tmpd_dim \pgf@x
5016 \pgfpathlineto { \pgfpoint \l_tmpd_dim \l_tmpc_dim }
5017 {

```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. The package `nicematrix` uses it even if `colortbl` is not loaded.

```

5018 \CT@arc@
5019 \pgfsetroundcap
5020 \pgfusepathqstroke
5021 }
5022 \pgfset { inner-sep = 1 pt }
5023 \pgfscope
5024 \pgftransformshift { \pgfpoint \l_tmpb_dim \l_tmpc_dim }
5025 \pgfnode { rectangle } { south-west }
5026 { \@@_math_toggle_token: #5 \@@_math_toggle_token: } { } { }
5027 \endpgfscope
5028 \pgftransformshift { \pgfpoint \l_tmpd_dim \l_tmpa_dim }
5029 \pgfnode { rectangle } { north-east }
5030 { \@@_math_toggle_token: #6 \@@_math_toggle_token: } { } { }
5031 \endpgfpicture
5032 }

```

## The keyword `\CodeAfter`

The `code-after` (inserted with the key `code-after` or after the keyword `\CodeAfter` can always begin with a list of pairs *key-value* between square brackets). Here the corresponding set of keys.

```

5033 \keys_define:nn { NiceMatrix / CodeAfter }
5034 {
5035 sub-matrix .code:n =
5036 \keys_set:nn { NiceMatrix / sub-matrix } { #1 } ,
5037 sub-matrix .value_required:n = true ,
5038 delimiters-color .tl_set:N = \l_@@_delimiters_color_tl ,
5039 delimiters-color .value_required:n = true ,
5040 unknown .code:n = \@@_error:n { Unknown-key-for-CodeAfter }
5041 }

```

In fact, in this subsection, we define the user command `\CodeAfter` for the case of the “normal syntax”. For the case of “light-syntax”, see the definition of the environment `{@@-light-syntax}` on p. 92.

In the environments of `nicematrix`, `\CodeAfter` will be linked to `\@@_CodeAfter::`. That macro must *not* be protected since it begins with `\omit`.

```
5042 \cs_new:Npn \@@_CodeAfter: { \omit \@@_CodeAfter_i:n }
```

However, in each cell of the environment, the command `\CodeAfter` will be linked to the following command `\@@_CodeAfter_i:n` which do *not* begin with `\omit` (and thus, the user will be able to use `\CodeAfter` without error and without the need to prefix by `\omit`).

We have to catch everything until the end of the current environment (of `nicematrix`). First, we go until the next command `\end`.

```

5043 \cs_new_protected:Npn \@@_CodeAfter_i:n #1 \end
5044 {
5045 \tl_gput_right:Nn \g_nicematrix_code_after_tl { #1 }
5046 \@@_CodeAfter_ii:n
5047 }

```

We catch the argument of the command `\end` (in `#1`).

```

5048 \cs_new_protected:Npn \@@_CodeAfter_ii:n #1
5049 {

```

If this is really the end of the current environment (of `nicematrix`), we put back the command `\end` and its argument in the TeX flow.

```
5050 \str_if_eq:eeTF \currenvir { #1 }
5051 { \end { #1 } }
```

If this is not the `\end` we are looking for, we put those tokens in `\g_nicematrix_code_after_tl` and we go on searching for the next command `\end` with a recursive call to the command `\@@_CodeAfter:n`.

```
5052 {
5053 \tl_gput_right:Nn \g_nicematrix_code_after_tl { \end { #1 } }
5054 \@@_CodeAfter_i:n
5055 }
5056 }
```

## The delimiters in the preamble

The command `\@@_delimiter:nnn` will be used to draw delimiters inside the matrix when delimiters are specified in the preamble of the array. It does *not* concern the exterior delimiters added by `{NiceArrayWithDelims}` (and `{pNiceArray}`, `{pNiceMatrix}`, etc.).

A delimiter in the preamble of the array will write an instruction `\@@_delimiter:nnn` in the `\g_@@_internal_code_after_tl` (and also potentially add instructions in the preamble provided to `\array` in order to add spaces between columns).

The first argument is the type of delimiter ((, [, \{, ], ] ou \}). The second argument is the number of columnm. The third argument is a boolean equal to `\c_true_bool` (resp. `\c_false_true`) when the delimiter must be put on the left (resp. right) side.

```
5057 \cs_new_protected:Npn \@@_delimiter:nnn #1 #2 #3
5058 {
5059 \pgfpicture
5060 \pgfrememberpicturepositiononpagetrue
5061 \pgf@relevantforpicturesizefalse
```

`\l_@@_y_initial_dim` and `\l_@@_y_final_dim` will be the *y*-values of the extremities of the delimiter we will have to construct.

```
5062 \@@_qpoint:n { row - 1 }
5063 \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
5064 \@@_qpoint:n { row - \@@_succ:n \c@iRow }
5065 \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
```

We will compute in `\l_tmpa_dim` the *x*-value where we will have to put our delimiter (on the left side or on the right side).

```
5066 \bool_if:nTF { #3 }
5067 { \dim_set_eq:NN \l_tmpa_dim \c_max_dim }
5068 { \dim_set:Nn \l_tmpa_dim { - \c_max_dim } }
5069 \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
5070 {
5071 \cs_if_exist:cT
5072 { \pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
5073 {
5074 \pgfpointanchor
5075 { \@@_env: - ##1 - #2 }
5076 { \bool_if:nTF { #3 } { west } { east } }
5077 \dim_set:Nn \l_tmpa_dim
5078 { \bool_if:nTF { #3 } \dim_min:nn \dim_max:nn \l_tmpa_dim \pgf@x }
5079 }
5080 }
```

Now we can put the delimiter with a node of PGF.

```
5081 \pgfset { inner_sep = \c_zero_dim }
5082 \dim_zero:N \nulldelimiterspace
5083 \pgftransformshift
5084 {
```

```

5085 \pgfpoint
5086 { \l_tmpa_dim }
5087 { (\l_@@_y_initial_dim + \l_@@_y_final_dim + \arrayrulewidth) / 2 }
5088 }
5089 \pgfnode
5090 { rectangle }
5091 { \bool_if:nTF { #3 } { east } { west } }
5092 {

```

Here is the content of the PGF node, that is to say the delimiter, constructed with its right size.

```

5093 \nullfont
5094 \c_math_toggle_token
5095 \tl_if_empty:NF \l_@@_delimiters_color_tl
5096 { \color { \l_@@_delimiters_color_tl } }
5097 \bool_if:nTF { #3 } { \left #1 } { \left . }
5098 \vcenter
5099 {
5100 \nullfont
5101 \hrule \@height
5102 \dim_eval:n { \l_@@_y_initial_dim - \l_@@_y_final_dim }
5103 \@depth \c_zero_dim
5104 \@width \c_zero_dim
5105 }
5106 \bool_if:nTF { #3 } { \right . } { \right #1 }
5107 \c_math_toggle_token
5108 }
5109 { }
5110 { }
5111 \endpgfpicture
5112 }

```

## The command SubMatrix

```

5113 \keys_define:nn { NiceMatrix / sub-matrix }
5114 {
5115 extra-height .dim_set:N = \l_@@_submatrix_extra_height_dim ,
5116 extra-height .value_required:n = true ,
5117 left-xshift .dim_set:N = \l_@@_submatrix_left_xshift_dim ,
5118 left-xshift .value_required:n = true ,
5119 right-xshift .dim_set:N = \l_@@_submatrix_right_xshift_dim ,
5120 right-xshift .value_required:n = true ,
5121 xshift .meta:n = { left-xshift = #1, right-xshift = #1 } ,
5122 xshift .value_required:n = true ,
5123 delimiters-color .tl_set:N = \l_@@_delimiters_color_tl ,
5124 delimiters-color .value_required:n = true ,
5125 slim .bool_set:N = \l_@@_submatrix_slim_bool ,
5126 slim .default:n = true ,
5127 }
5128 \keys_define:nn { NiceMatrix }
5129 {
5130 SubMatrix .inherit:n = NiceMatrix /sub-matrix ,
5131 CodeAfter / sub-matrix .inherit:n = NiceMatrix / sub-matrix
5132 }

```

The following keys set is for the command `\SubMatrix` itself (not the tuning of `\SubMatrix` that can be done elsewhere).

```

5133 \keys_define:nn { NiceMatrix / SubMatrix }
5134 {
5135 name .code:n =
5136 \tl_if_empty:nTF { #1 }
5137 { \@@_error:n { Invalid-name-format } }
5138 {
5139 \regex_match:nnTF { \A[A-Za-z][A-Za-z0-9]*\Z } { #1 }

```

```

5140 {
5141 \seq_if_in:NnTF \g_@@_submatrix_names_seq { #1 }
5142 { \@@_error:nn { Duplicate-name-for-SubMatrix } { #1 } }
5143 {
5144 \str_set:Nn \l_@@_submatrix_name_str { #1 }
5145 \seq_gput_right:Nn \g_@@_submatrix_names_seq { #1 }
5146 }
5147 }
5148 { \@@_error:n { Invalid-name-format } }
5149 } ,
5150 name .value_required:n = true ,
5151 unknown .code:n = \@@_error:n { Unknown-key-for-SubMatrix }
5152 }

```

In the `code-after`, the following command `\@@_SubMatrix` will be linked to `\SubMatrix`.

- #1 is the left delimiter;
- #2 is the upper-left cell of the matrix with the format  $i-j$ ;
- #2 is the lower-right cell of the matrix with the format  $i-j$ ;
- #4 is the right delimiter;
- #5 is the list of options of the command.

```

5153 \NewDocumentCommand \@@_SubMatrix { m m m m ! O {} }
5154 {
5155 \group_begin:

```

The command `\@@_cut_on_hyphen:w` cuts on the hyphen an argument of the form  $i-j$ . The value of  $i$  is stored in `\l_tmpa_tl` and the value of  $j$  is stored in `\l_tmpb_tl`.

```

5156 \@@_cut_on_hyphen:w #3 \q_stop
5157 \tl_clear_new:N \l_tmpc_tl

5209 \dim_set:Nn \l_@@_y_initial_dim
5210 { \dim_max:nn \l_@@_y_initial_dim \pgf@y }
5211 }
5212 \cs_if_exist:cT
5213 { pgf @ sh @ ns @ \@@_env: - \l_tmpc_tl - ##1 }
5214 {
5215 \pgfpointanchor { \@@_env: - \l_tmpc_tl - ##1 } { south }
5216 \dim_set:Nn \l_@@_y_final_dim
5217 { \dim_min:nn \l_@@_y_final_dim \pgf@y }
5218 }
5219 }
5220 \dim_set:Nn \l_tmpa_dim
5221 {
5222 \l_@@_y_initial_dim - \l_@@_y_final_dim +
5223 \l_@@_submatrix_extra_height_dim - \arrayrulewidth
5224 }
5225 \dim_set_eq:NN \nulldelimiterspace \c_zero_dim

```

If the key `name` has been used for the command `\SubMatrix`, we create a PGF node with that name for the submatrix (this node does not take into account the delimiters that we will put after).

```

5226 \str_if_empty:NF \l_@@_submatrix_name_str
5227 {
5228 \@@_pgf_rect_node:nnnn \l_@@_submatrix_name_str
5229 \l_@@_x_initial_dim \l_@@_y_initial_dim
5230 \l_@@_x_final_dim \l_@@_y_final_dim
5231 }

```

Now, we deal with the left delimiter. Of course, the environment `{pgfscope}` is for the `\pgftransformshift`.

```

5232 \begin{pgfscope}
5233 \pgftransformshift
5234 {
5235 \pgfpoint
5236 { \l_@@_x_initial_dim - \l_@@_submatrix_left_xshift_dim }
5237 { (\l_@@_y_initial_dim + \l_@@_y_final_dim) / 2 }
5238 }
5239 \str_if_empty:NTF \l_@@_submatrix_name_str
5240 { \@@_node_left:nn #1 { } }
5241 { \@@_node_left:nn #1 { \@@_env: - \l_@@_submatrix_name_str - left } }
5242 \end{pgfscope}

```

Now, we deal with the right delimiter.

```

5243 \pgftransformshift
5244 {
5245 \pgfpoint
5246 { \l_@@_x_final_dim + \l_@@_submatrix_right_xshift_dim }
5247 { (\l_@@_y_initial_dim + \l_@@_y_final_dim) / 2 }
5248 }
5249 \str_if_empty:NTF \l_@@_submatrix_name_str
5250 { \@@_node_right:nn #4 { } }
5251 {
5252 \@@_node_right:nn #4 { \@@_env: - \l_@@_submatrix_name_str - right }
5253 }
5254 \endpgfpicture
5255 }
5256 \group_end:
5257 }
```

The command `\@@_node_left:nn` puts the left delimiter with the correct size. The argument `#1` is the delimiter to put. The argument `#2` is the name we will give to this PGF node (if the key `name` has been used in `\SubMatrix`).

```

5258 \cs_new_protected:Npn \@@_node_left:nn #1 #2
5259 {
5260 \pgfnode
5261 { rectangle }
5262 { east }
5263 {

```

```

5298 \@width \c_zero_dim
5299 }
5300 \right #1
5301 \c_math_toggle_token
5302 }
5303 { #2 }
5304 { }
5305 }

```

## We process the options at package loading

We process the options when the package is loaded (with `\usepackage`) but we recommend to use `\NiceMatrixOptions` instead.

We must process these options after the definition of the environment `{NiceMatrix}` because the option `renew-matrix` executes the code `\cs_set_eq:NN \env@matrix \NiceMatrix`.

Of course, the command `\NiceMatrix` must be defined before such an instruction is executed.

The boolean `\g_@@_footnotehyper_bool` will indicate if the option `footnotehyper` is used.

```
5306 \bool_new:N \c_@@_footnotehyper_bool
```

The boolean `\c_@@_footnote_bool` will indicate if the option `footnote` is used, but quickly, it will also be set to true if the option `footnotehyper` is used.

```

5307 \bool_new:N \c_@@_footnote_bool
5308 \@@_msg_new:nnn { Unknown~option~for~package }
5309 {

## 18 History

The successive versions of the file `nicematrix.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://www.tug.org/svn/texlive/trunk/Master/texmf-dist/tex/latex/nicematrix/nicematrix.sty>

### Changes between versions 1.0 and 1.1

The dotted lines are no longer drawn with Tikz nodes but with Tikz circles (for efficiency). Modification of the code which is now twice faster.

## Changes between versions 1.1 and 1.2

New environment `{NiceArray}` with column types L, C and R.

## Changes between version 1.2 and 1.3

New environment `{pNiceArrayC}` and its variants.

Correction of a bug in the definition of `{BNiceMatrix}`, `{vNiceMatrix}` and `{VNiceMatrix}` (in fact, it was a typo).

Options are now available locally in `{pNiceMatrix}` and its variants.

The names of the options are changed. The old names were names in “camel style”.

## Changes between version 1.3 and 1.4

The column types w and W can now be used in the environments `{NiceArray}`, `{pNiceArrayC}` and its variants with the same meaning as in the package `array`.

New option `columns-width` to fix the same width for all the columns of the array.

## Changes between version 1.4 and 2.0

The versions 1.0 to 1.4 of `nicematrix` were focused on the continuous dotted lines whereas the version 2.0 of `nicematrix` provides different features to improve the typesetting of mathematical matrices.

## Changes between version 2.0 and 2.1

New implementation of the environment `{pNiceArrayRC}`. With this new implementation, there is no restriction on the width of the columns.

The package `nicematrix` no longer loads `mathtools` but only `amsmath`.

Creation of “medium nodes” and “large nodes”.

## Changes between version 2.1 and 2.1.1

Small corrections: for example, the option `code-for-first-row` is now available in the command `\NiceMatrixOptions`.

Following a discussion on TeX StackExchange<sup>49</sup>, Tikz externalization is now deactivated in the environments of the package `nicematrix`.<sup>50</sup>

## Changes between version 2.1.2 and 2.1.3

When searching the end of a dotted line from a command like `\Cdots` issued in the “main matrix” (not in the exterior column), the cells in the exterior column are considered as outside the matrix. That means that it’s possible to do the following matrix with only a `\Cdots` command (and a single `\Vdots`).

$$\begin{pmatrix} 0 & \cdots & 0 \\ 0 & \ddots & \ddots \\ 0 & & 0 \end{pmatrix}_{L_i}^{C_j}$$

<sup>49</sup>cf. [tex.stackexchange.com/questions/450841/tikz-externalize-and-nicematrix-package](https://tex.stackexchange.com/questions/450841/tikz-externalize-and-nicematrix-package)

<sup>50</sup>Before this version, there was an error when using `nicematrix` with Tikz externalization. In any case, it’s not possible to externalize the Tikz elements constructed by `nicematrix` because they use the options `overlay` and `remember picture`.

## **Changes between version 2.1.3 and 2.1.4**

Replacement of some options `0 { }` in commands and environments defined with `xparse` by `! 0 { }` (because a recent version of `xparse` introduced the specifier `!` and modified the default behaviour of the last optional arguments).

See [www.texdev.net/2018/04/21/xparse-optional-arguments-at-the-end](http://www.texdev.net/2018/04/21/xparse-optional-arguments-at-the-end)

## **Changes between version 2.1.4 and 2.1.5**

Compatibility with the classes `revtex4-1` and `revtex4-2`.

Option `allow-duplicate-names`.

## **Changes between version 2.1.5 and 2.2**

Possibility to draw horizontal dotted lines to separate rows with the command `\hdottedline` (similar to the classical command `\hline` and the command `\hdashline` of `arydshln`).

Possibility to draw vertical dotted lines to separate columns with the specifier `:` in the preamble (similar to the classical specifier `|` and the specifier `:` of `arydshln`).

## **Changes between version 2.2 and 2.2.1**

Improvement of the vertical dotted lines drawn by the specifier `:` in the preamble.

Modification of the position of the dotted lines drawn by `\hdottedline`.

## **Changes between version 2.2.1 and 2.3**

Compatibility with the column type `S` of `siunitx`.

Option `hlines`.

## **Changes between version 2.3 and 3.0**

Modification of `\Hdotsfor`. Now `\Hdotsfor` erases the `\vlines` (of `|`) as `\hdotsfor` does.

Composition of exterior rows and columns on the four sides of the matrix (and not only on two sides) with the options `first-row`, `last-row`, `first-col` and `last-col`.

## **Changes between version 3.0 and 3.1**

Command `\Block` to draw block matrices.

Error message when the user gives an incorrect value for `last-row`.

A dotted line can no longer cross another dotted line (excepted the dotted lines drawn by `\cdottedline`, the symbol `:` (in the preamble of the array) and `\line` in `code-after`).

The starred versions of `\Cdots`, `\Ldots`, etc. are now deprecated because, with the new implementation, they become pointless. These starred versions are no longer documented.

The vertical rules in the matrices (drawn by `|`) are now compatible with the color fixed by `colortbl`. Correction of a bug: it was not possible to use the colon `:` in the preamble of an array when `pdflatex` was used with `french-babel` (because `french-babel` activates the colon in the beginning of the document).

## **Changes between version 3.1 and 3.2 (and 3.2a)**

Option `small`.

## Changes between version 3.2 and 3.3

The options `first-row`, `last-row`, `first-col` and `last-col` are now available in the environments `{NiceMatrix}`, `{pNiceMatrix}`, `{bNiceMatrix}`, etc.

The option `columns-width=auto` doesn't need any more a second compilation.

The options `renew-dots`, `renew-matrix` and `transparent` are now available as package options (as said in the documentation).

The previous version of `nicematrix` was incompatible with a recent version of `expl3` (released 2019/09/30). This version is compatible.

## Changes between version 3.3 and 3.4

Following a discussion on TeX StackExchange<sup>51</sup>, optimization of Tikz externalization is disabled in the environments of `nicematrix` when the class `standalone` or the package `standalone` is used.

## Changes between version 3.4 and 3.5

Correction on a bug on the two previous versions where the `code-after` was not executed.

## Changes between version 3.5 and 3.6

LaTeX counters `iRow` and `jCol` available in the cells of the array.

Addition of `\normalbaselines` before the construction of the array: in environments like `{align}` of `amsmath` the value of `\baselineskip` is changed and if the options `first-row` and `last-row` were used in an environment of `nicematrix`, the position of the delimiters was wrong.

A warning is written in the `.log` file if an obsolete environment is used.

There is no longer artificial errors `Duplicate~name` in the environments of `amsmath`.

## Changes between version 3.6 and 3.7

The four "corners" of the matrix are correctly protected against the four codes: `code-for-first-col`, `code-for-last-col`, `code-for-first-row` and `code-for-last-row`.

New command `\pAutoNiceMatrix` and its variants (suggestion of Christophe Bal).

## Changes between version 3.7 and 3.8

New programmation for the command `\Block` when the block has only one row. With this programmation, the vertical rules drawn by the specifier "`|`" at the end of the block is actually drawn. In previous versions, they were not because the block of one row was constructed with `\multicolumn`. An error is raised when an obsolete environment is used.

## Changes between version 3.8 and 3.9

New commands `\NiceMatrixLastEnv` and `\OnlyMainNiceMatrix`.

New options `create-medium-nodes` and `create-large-nodes`.

## Changes between version 3.9 and 3.10

New option `light-syntax` (and `end-of-row`).

New option `dotted-lines-margin` for fine tuning of the dotted lines.

---

<sup>51</sup>cf. [tex.stackexchange.com/questions/510841/nicematrix-and-tikz-external-optimize](https://tex.stackexchange.com/questions/510841/nicematrix-and-tikz-external-optimize)

## Changes between versions 3.10 and 3.11

Correction of a bug linked to `first-row` and `last-row`.

## Changes between versions 3.11 and 3.12

Command `\rotate` in the cells of the array.

Options `vlines`, `hlines` and `hvlines`.

Option `baseline` pour `{NiceArray}` (not for the other environments).

The name of the Tikz nodes created by the command `\Block` has changed: when the command has been issued in the cell  $i-j$ , the name is  `$i-j$ -block` and, if the creation of the “medium nodes” is required, a node  `$i-j$ -block-medium` is created.

If the user tries to use more columns than allowed by its environment, an error is raised by `nicematrix` (instead of a low-level error).

The package must be loaded with the option `obsolete-environments` if we want to use the deprecated environments.

## Changes between versions 3.12 and 3.13

The behaviour of the command `\rotate` is improved when used in the “last row”.

The option `dotted-lines-margin` has been renamed in `xdots/shorten` and the options `xdots/color` and `xdots/line-style` have been added for a complete customization of the dotted lines.

In the environments without preamble (`{NiceMatrix}`, `{pNiceMatrix}`, etc.), it’s possible to use the options `l` (=L) or `r` (=R) to specify the type of the columns.

The starred versions of the commands `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots` and `\Idots` are deprecated since the version 3.1 of `nicematrix`. Now, one should load `nicematrix` with the option `starred-commands` to avoid an error at the compilation.

The code of `nicematrix` no longer uses Tikz but only PGF. By default, Tikz is *not* loaded by `nicematrix`.

## Changes between versions 3.13 and 3.14

Correction of a bug (question 60761504 on `stackoverflow`).

Better error messages when the user uses & or \\" when `light-syntax` is in force.

## Changes between versions 3.14 and 3.15

It’s possible to put labels on the dotted lines drawn by `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Idots`, `\Hdotsfor` and the command `\line` in the `code-after` with the tokens `_` and `^`.

The option `baseline` is now available in all the environments of `nicematrix`. Before, it was available only in `{NiceArray}`.

New keyword `\CodeAfter` (in the environments of `nicematrix`).

## Changes between versions 3.15 and 4.0

New environment `{NiceTabular}`

Commands to color cells, rows and columns with a perfect result in the PDF.

## Changes between versions 4.0 and 4.1

New keys `cell-space-top-limit` and `cell-space-bottom-limit`

New command `\diagbox`

The key `hvline` don’t draw rules in the blocks (commands `\Block`) and in the virtual blocks corresponding to the dotted lines.

## Changes between versions 4.1 and 4.2

It's now possible to write `\begin{pNiceMatrix}a&b\\c&d\end{pNiceMatrix}^2` with the expected result.

## Changes between versions 4.2 and 4.3

The horizontal centering of the content of a `\Block` is correct even when an instruction such as `!{\quad}` is used in the preamble of the array.

It's now possible to use the command `\Block` in the “last row”.

## Changes between versions 4.3 and 4.4

New key `hvlines-except-corners`.

## Changes between versions 4.4 and 5.0

Use of the standard column types `l`, `c` and `r` instead of `L`, `C` and `R`.

It's now possible to use the command `\diagbox` in a `\Block`.

Command `\tabularnote`

## Changes between versions 5.0 and 5.1

The vertical rules specified by `|` in the preamble are not broken by `\hline\hline` (and other).

Environment `{NiceTabular*}`

Command `\Vdotsfor` similar to `\Hdotsfor`

The variable `\g_nicematrix_code_after_t1` is now public.

## Changes between versions 5.1 and 5.2

The vertical rules specified by `|` or `||` in the preamble respect the blocks.

Key `respect-blocks` for `\rowcolors` (with a `s`) in the `code-before`.

The variable `\g_nicematrix_code_before_t1` is now public.

The key `baseline` can take in as value of the form `line-i` to align the `\hline` in the row *i*.

The key `hvlines-except-corners` may take in as value a list of corners (eg: NW,SE).

## Changes between versions 5.2 and 5.3

Keys `c`, `r` and `l` for the command `\Block`.

It's possible to use the key `draw-first` with `\Ddots` and `\Idots` to specify which dotted line will be drawn first (the other lines will be drawn parallel to that one if parallelization is activated).

## Changes between versions 5.3 and 5.4

Key `tabularnote`.

Different behaviour for the mono-column blocks.

## Changes between versions 5.4 and 5.5

The user must never put `\omit` before `\CodeAfter`.

Correction of a bug: the tabular notes `\tabularnotes` were not composed when present in a block (except a mono-column block).

## Changes between versions 5.5 and 5.6

Different behaviour for the mono-row blocks.

New command \NotEmpty.

## Changes between versions 5.6 and 5.7

New key `delimiters-color`

Keys `fill`, `draw` and `line-width` for the command \Block.

## Changes between versions 5.7 and 5.8

Keys `cols` and `restart` of the command \rowcolors in the `code-before`.

Modification of the behaviour of \\\ in the columns of type p, m or b (for a behaviour similar to the environments of array).

Better error messages for the command \Block.

## Changes between versions 5.8 and 5.9

Correction of a bug: in the previous versions, it was not possible to use the key `line-style` for the continuous dotted lines when the Tikz library `babel` was loaded.

New key `cell-space-limits`.

## Changes between versions 5.9 and 5.10

New command \SubMatrix available in the \CodeAfter.

It's possible to provide options (between brackets) to the command \CodeAfter.

A (non fatal) error is raised when the key `transparent`, which is deprecated, is used.

# Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
