

# The `kvsetkeys` package

Heiko Oberdiek\*

2016/05/16 v1.17

## Abstract

Package `kvsetkeys` provides `\kvsetkeys`, a variant of package `keyval`'s `\setkeys`. It allows to specify a handler that deals with unknown options. Active commas and equal signs may be used (e.g. see `babel`'s shorthands) and only one level of curly braces is removed from the values.

# 1 Documentation

First I want to recommend the very good review article “A guide to key-value methods” by Joseph Wright [1]. It introduces the different key-value packages and compares them.

## 1.1 Motivation

\kvsetkeys serves as replacement for keyval’s \setkeys. It basically uses the same syntax. But the implementation is more robust and predictable:

**Active syntax characters:** Comma ‘,’ and the equals sign ‘=’ are used inside key value lists as syntax characters. Package keyval uses the catcode of the characters that is active during package loading, usually this is catcode 12 (other). But it can happen that the catcode setting of the syntax characters changes. Especially active characters are of interest, because some language adaptations uses them. For example, option `turkish` of package `babel` uses the equals sign as active shorthand character. Therefore package `kvsetkeys` deals with both catcode settings 12 (other) and 13 (active).

**Brace removal:** Package keyval’s \setkeys removes up to two levels of curly braces around the value in some unpredictable way:

```
\setkeys{fam}{key={{value}}}
```

→ value

```
\setkeys{fam}{key={{{value}}}}
```

→ {value}

```
\setkeys{fam}{key= {{{value}}}}
```

→ {{value}}

This package `kvsetkeys` follows a much stronger rule: Exactly one level of braces are removed from an item, if the item is surrounded by curly braces. An item can be a the key value pair, the key or the value.

```
\kvsetkeys{fam}{key={value}} → value
\kvsetkeys{fam}{key={{value}}} → {value}
\kvsetkeys{fam}{key= {{value}}} → {value}
```

**Arbitrary values:** Unmatched conditionals are supported.

Before I describe `\kvsetkeys` in more detail, first I want to explain, how this package deals with key value lists. For the package also provides low level interfaces that can be used by package authors.

## 1.2 Normalizing key value lists

```
\kv@normalize {\langle key value list \rangle}
```

If the user specifies key value lists, he usually prefers nice formatted source code, e.g.:

```
\hypersetup{
    pdftitle   = {...},
    pdfsubject = {...},
    pdfauthor  = {...},
    pdfkeywords = {...},
    ...
}
```

Thus there can be spaces around keys, around = or around the value. Also empty entries are possible by too many commas. Therefore these spaces and empty entries are silently removed by package `keyval` and this package. Whereas the contents of the value can be protected by curly braces, especially if spaces or commas are used inside, a key name must not use spaces or other syntax characters.

`\kv@normalize` takes a key value list and performs the cleanup:

- Spaces are removed.
- Syntax characters (comma and equal sign) that are active are replaced by the same characters with standard catcode. (Example: `babel`'s language option `turkish` uses the equal sign as active shorthand character.)

The result is stored in `\kv@list`, e.g.:

```
\kv@list → ,pdftitle={...},pdfsubject={...},...,
```

Curly braces around values (or keys) remain untouched.

**v1.3+:** One comma is added in front of the list and each pair ends with a comma.

Thus an empty list consists of one comma, otherwise two commas encloses the list. Empty entries other than the first are removed.

**v1.0 – v1.2:** Empty entries are removed later. In fact it adds a comma at the begin and end to protect the last value and an easier implementation.

## 1.3 Parsing key value lists

```
\kv@parse {\langle key value list \rangle} {\langle processor \rangle}
```

It is easier to parse a normalized list, thus `\kv@parse` normalizes the list and calls `\kv@parse@normalized`.

```
\kv@parse@normalized {\langle key value list \rangle} {\langle processor \rangle}
```

Now the key value list is split into single key value pairs. For further processing the key and value are given as arguments for the  $\langle processor \rangle$ :

```
\langle processor \rangle {\langle key \rangle} {\langle value \rangle}
```

Also key and value are stored in macro names:

- $\backslash kv@key$  stores the key.
- $\backslash kv@value$  stores the value or if the value was not specified it has the meaning  $\backslash relax$ .

The behaviour in pseudo code:

```
foreach (\langle key \rangle, \langle value \rangle) in (\langle key value list \rangle)
    \kv@key := \langle key \rangle
    \kv@value := \langle value \rangle
    \langle processor \rangle {\langle key \rangle} {\langle value \rangle}
```

```
\kv@break
```

Since version 2011/03/03 v1.11  $\backslash kv@break$  can be called inside the  $\langle processor \rangle$  of  $\backslash kv@parse$  or  $\backslash kv@parse@normalized$ , then the processing is stopped and the following entries discarded.

## 1.4 Processing key value pairs

Key value pairs can be processed in many different ways. For example, the processor for  $\backslash kvsetkeys$  works similar to  $\backslash setkeys$  of package **keyval**. There unknown keys raise an error.

Package **xkeyval** also knows a star form of  $\backslash setkeys$  that stores unknown keys in an internal macro for further processing with  $\backslash setrmkeys$  and similar macros. This feature is covered by processor  $\backslash kv@processor@known$ .

### 1.4.1 Processing similar to **keyval**

```
\kv@processor@default {\langle family \rangle} {\langle key \rangle} {\langle value \rangle}
```

There are many possibilities to process key value pairs.  $\backslash kv@processor@default$  is the processor used in  $\backslash kvsetkeys$ . It reimplements and extends the behaviour of **keyval**'s  $\backslash setkeys$ . In case of unknown keys  $\backslash setkeys$  raise an error. This processor, however, calls a handler instead, if it is provided by the family. Both  $\langle family \rangle$  and  $\langle key \rangle$  may contain package **babel**'s shorthands (since 2011/04/07 v1.13).

Since 2011/10/18 v1.15 the family handler can reject the successful handling of a key by calling  $\backslash kv@handled@false$ .

Since 2016/05/16 v1.17  $\backslash kv@processor@default$  also defines macro  $\backslash kv@fam$  with meaning  $\langle family \rangle$  for convenience.

#### 1.4.2 Processing similar to \setkeys\* of package xkeyval

```
\kv@processor@known {\langle family\rangle} {\langle cmd\rangle} {\langle key\rangle} {\langle value\rangle}
```

The key value processor `\kv@processor@known` behaves similar to `\kv@processor@default`. If the `\langle key\rangle` exists in the `\langle family\rangle` its code is called, otherwise the family handler is tried. If the family handler is not set or cannot handle the key, the unknown key value pair is added to the macro `\langle cmd\rangle`. Since 2011/10/18 v1.15.

The behaviour in pseudo code:

```
if \langle key\rangle exists
    call the keyval code of \langle key\rangle
else
    if \langle handler\rangle for \langle family\rangle exists
        handled = true
        \langle handler\rangle {\langle key\rangle} {\langle value\rangle}
        if handled
        else
            add "\{\langle key\rangle\}=\{\langle value\rangle\}" to \{\langle cmd\rangle\}
        fi
    else
        add "\{\langle key\rangle\}=\{\langle value\rangle\}" to \{\langle cmd\rangle\}
        raise unknown key error
    fi
fi
```

Since 2016/05/16 v1.17 `\kv@processor@known` also defines macro `\kv@fam` with meaning `\langle family\rangle` for convenience.

#### 1.5 Default family handler

`\kv@processor@default` calls `\langle handler\rangle`, the default handler for the family, if the key does not exist in the family. The handler is called with two arguments, the key and the value. It can be defined with `\kv@set@family@handler`:

```
\kv@set@family@handler {\langle family\rangle} {\langle handler definition\rangle}
```

This sets the default family handler for the keyval family `\langle family\rangle`. Inside `\langle handler definition\rangle` #1 stands for the key and #2 is the value. Also `\kv@key` and `\kv@value` can be used for the key and the value. If the value is not given, `\kv@value` has the meaning `\relax`.

```
\kv@unset@family@handler {\langle family\rangle}
```

It removes the family handler for `\langle family\rangle`. Since 2011/10/18 v1.15.

#### 1.6 Put it all together

```
\kvsetkeys {\langle family\rangle} {\langle key value list\rangle}
```

Macro `\kvsetkeys` processes the `\langle key value list\rangle` with the standard processor `\kv@processor@default`:

```
\kv@parse {\langle key value list\rangle}{\kv@processor@default {\langle family\rangle}}
```

```
\kvsetknownkeys {\langle family\rangle} {\langle cmd\rangle} {\langle key value list\rangle}
```

Macro `\kvsetknownkeys` processes the `\langle key value list\rangle` with processor `\kv@processor@known`. All key value pairs with keys that are not known in `\langle family\rangle` are stored in macro `\langle cmd\rangle`. A previous contents of macro `\langle cmd\rangle` will be overwritten. If all keys can be handled, `\langle cmd\rangle` will be empty, otherwise it contains a key value list of unhandled key value pairs. Since 2011/10/18 v1.15.

Pseudo code:

```
create macro \cdaux with unique name (inside the current group)
\def\cdaux{}%
\kv@parse {\langle key value list\rangle}{\kv@processor@known {\langle family\rangle} {\langle cdaux\rangle}}%
\let\cmd=\cdaux
```

```
\kvsetkeys@expandafter {\langle family\rangle} {\langle list cmd\rangle}
\kvsetknownkeys@expandafter {\langle family\rangle} {\langle cmd\rangle} {\langle list cmd\rangle}
```

Both macros behave like the counterparts without suffix `@expandafter`. The difference is that the key value list is given as macro that is expanded once. Since 2011/10/18 v1.15.

Thus you can replace `\setkeys` of package `keyval` by the key value parser of this package:

```
\renewcommand*{\setkeys}{\kvsetkeys}
or
\let\setkeys\kvsetkeys
```

## 1.7 Comma separated lists

Since version 2007/09/29 v1.3 this package also supports the normalizing and parsing of general comma separated lists.

```
\comma@normalize {\langle comma list\rangle}
```

Macro `\comma@normalize` normalizes the comma separated list, removes spaces around commas. The result is put in macro `\comma@list`.

```
\comma@parse {\langle comma list\rangle} {\langle processor\rangle}
```

Macro `\comma@parse` first normalizes the comma separated list and then parses the list by calling `\comma@parse@normalized`.

```
\comma@parse@normalized {\langle normalized comma list\rangle} {\langle processor\rangle}
```

The list is parsed. Empty entries are ignored. `\langle processor\rangle` is called for each non-empty entry with the entry as argument:

```
\processor{\entry}
```

Also the entry is stored in the macro `\comma@entry`.

```
\comma@break
```

Since version 2011/03/03 v1.11 `\comma@break` can be called inside the *<processor>* of `\comma@parse` or `\comma@parse@normalized`, then the processing is stopped and the following entries discarded.

## 2 Example

The following example prints a short piece of HTML code using the tabbing environment for indenting purpose and a key value syntax for specifying the attributes of an HTML tag. The example illustrates the use of a default family handler.

```
1 {*example}
2 \documentclass{article}
3 \usepackage[T1]{fontenc}
4 \usepackage{kvsetkeys}
5 \usepackage{keyval}
6
7 \makeatletter
8 \newcommand*{\tag}[2][]{%
9   % #1: attributes
10  % #2: tag name
11  \begingroup
12  \toks@={}
13  \let\@endslash\empty
14  \kvsetkeys{tag}{#1}%
15  \texttt{%
16    \textless #2\the\toks@\textgreater
17  }%
18  \endgroup
19 }
20 \kv@set@family@handler{tag}{%
21  % #1: key
22  % #2: value
23  \toks@\expandafter{%
24    \the\toks@
25    \space
26    #1=\string"\#2\string"%
27  }%
28 }
29 \define@key{tag}{/}[]{%
30   \def\@endslash{/}%
31 }
32 \makeatother
33
34 \begin{document}
35 \begin{tabbing}
36   \mbox{} \qquad \=\qquad \=\kill
37   \tag{html} \\
38   \>\dots \\
39   \>\tag[border=1]{table} \\
40   \>\>\tag[width=200, span=3, /]{colgroup} \\
41   \>\>\dots \\
42   \>\tag{/table} \\
43   \>\dots \\
44   \tag{/html} \\
45 \end{tabbing}
46 \end{document}
```

```
47 </example>
```

## 3 Implementation

### 3.1 Identification

```
48 /*package)

## 4 Installation

### 4.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

---

<sup>1</sup>CTAN:[pkg/kvsetkeys](#)

[CTAN:macros/latex/contrib/oberdiek/kvsetkeys.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/kvsetkeys.pdf](#) Documentation.

**Bundle.** All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for  $\text{\TeX}$  Files” ([CTAN:pkg/tds](#)). Directories with `texmf` in their name are usually organized this way.

## 4.2 Bundle installation

**Unpacking.** Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

## 4.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain  $\text{\TeX}$ :

```
tex kvsetkeys.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>kvsetkeys.sty</code>	→ <code>tex/generic/oberdiek/kvsetkeys.sty</code>
<code>kvsetkeys.pdf</code>	→ <code>doc/latex/oberdiek/kvsetkeys.pdf</code>
<code>kvsetkeys-example.tex</code>	→ <code>doc/latex/oberdiek/kvsetkeys-example.tex</code>
<code>kvsetkeys.dtx</code>	→ <code>source/latex/oberdiek/kvsetkeys.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

## 4.4 Refresh file name databases

If your  $\text{\TeX}$  distribution ( $\text{\TeX} \text{Live}$ ,  $\text{MiK}\text{\TeX}$ , ...) relies on file name databases, you must refresh these. For example,  $\text{\TeX} \text{Live}$  users run `texhash` or `mktexlsr`.

## 4.5 Some details for the interested

**Unpacking with L<sup>A</sup>T<sub>E</sub>X.** The `.dtx` chooses its action depending on the format:

**plain  $\text{\TeX}$ :** Run `docstrip` and extract the files.

**L<sup>A</sup>T<sub>E</sub>X:** Generate the documentation.

If you insist on using L<sup>A</sup>T<sub>E</sub>X for `docstrip` (really, `docstrip` does not need L<sup>A</sup>T<sub>E</sub>X), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{kvsetkeys.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL<sup>A</sup>T<sub>E</sub>X:

```
pdflatex kvsetkeys.dtx
makeindex -s gind.ist kvsetkeys.idx
pdflatex kvsetkeys.dtx
makeindex -s gind.ist kvsetkeys.idx
pdflatex kvsetkeys.dtx
```

## 5 References

- [1] A guide to key-value methods, Joseph Wright, second draft for TUGBoat, 2009-03-17. <https://www.texdev.net/uploads/2009/03/keyval.pdf>

## 6 History

### [2006/03/06 v1.0]

- First version.

### [2006/10/19 v1.1]

- Fix of `\kv@set@family@handler`.
- Example added.

### [2007/09/09 v1.2]

- Using package `infwarerr` for error messages.
- Catcode section rewritten.

### [2007/09/29 v1.3]

- Normalizing and parsing of comma separated lists added.
- `\kv@normalize` rewritten.
- Robustness increased for normalizing and parsing, e.g. for values with unmatched conditionals.
- $\varepsilon$ -T<sub>E</sub>X is used if available.
- Tests added for normalizing and parsing.

### [2009/07/19 v1.4]

- Bug fix for `\kv@normalize`: unwanted space removed (Florent Chervet).

## [2009/07/30 v1.5]

- Documentation addition: recommendation for Joseph Wright's review article.

## [2009/12/12 v1.6]

- Short info shortened.

## [2009/12/22 v1.7]

- Internal optimization (`\KVS@CommaSpace`, ..., `\KVS@EqualsSpace`).

## [2010/01/28 v1.8]

- Compatibility to `iniTeX` added.

## [2010/03/01 v1.9]

- Support of `\par` inside values.

## [2011/01/30 v1.10]

- Already loaded package files are not input in plain `TeX`.

## [2011/03/03 v1.11]

- `\kv@break` and `\comma@break` added.

## [2011/04/05 v1.12]

- Error message with recovery action in help message (request by GL).

## [2011/04/07 v1.13]

- `\kv@processor@default` supports package `babel`'s shorthands.
- `\kv@set@family@handler` with shorthand support.

## [2011/06/15 v1.14]

- Some optimizations in token register uses (GL, HO).

## [2011/10/18 v1.15]

- `\kv@processor@known` and `\kvsetknownkeys` added.
- `\kvsetkeys@expandafter` and `\kvsetknownkeys@expandafter` added.
- Family handler can report success or failure by `\kv@handled@true` or `\kv@handled@false`.
- `\kv@unset@family@handler` added.

[2012/04/25 v1.16]

- `\kv@processor@default` and `\kv@processor@known` define macro `\kv@fam` for convenience.
- Catcode section: Catcode setting for + added for ε-TeX.

[2016/05/16 v1.17]

- Documentation updates.

## 7 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
