

# The `ltxcmds` package

Heiko Oberdiek  
<heiko.oberdiek at googlemail.com>

2010/03/01 v1.3

## Abstract

The package `ltxcmds` exports some utility macros from the L<sup>A</sup>T<sub>E</sub>X kernel into a separate namespace and also provides them for other formats such as plain-T<sub>E</sub>X.

# 1 Documentation

## 1.1 Introduction

Many of my packages also support other formats such as plain-T<sub>E</sub>X. Because I am rather familiar with the utility macros from L<sup>A</sup>T<sub>E</sub>X's kernel (e.g. `\@gobble`, `\@firstoftwo`), I found myself rewriting them again and again, because they are lacking in plain-T<sub>E</sub>X.

Therefore this package provides often used macros and similar ones with the name prefix `\ltx@`. This avoids also faulty redefinitions. I remember an example where a package redefined `\@firstoftwo` with forgetting `\long`.

## 1.2 Numbers

```
\ltx@zero
\ltx@one
\ltx@two
\ltx@cclv
```

These commands are numbers 0, 1, 2 and 255. They are not digits and a space is not gobbled afterwards.

## 1.3 Argument killers

```
\ltx@gobble {\langle 1 \rangle} → ⟨1⟩
\ltx@gobbletwo {\langle 1 \rangle} {\langle 2 \rangle} → ⟨1⟩
\ltx@gobblethree {\langle 1 \rangle} {\langle 2 \rangle} {\langle 3 \rangle} → ⟨1⟩
\ltx@gobblefour {\langle 1 \rangle} {\langle 2 \rangle} {\langle 3 \rangle} {\langle 4 \rangle} → ⟨1⟩
```

## 1.4 Argument grabbers

```
\ltx@firstofone {\langle 1 \rangle} → ⟨1⟩
\ltx@firstoftwo {\langle 1 \rangle} {\langle 2 \rangle} → ⟨1⟩
\ltx@secondoftwo {\langle 1 \rangle} {\langle 2 \rangle} → ⟨2⟩
```

## 1.5 List helpers

\ltx@car {\langle 1 \rangle} ... \nil	→ ⟨ 1 ⟩
\ltx@cdr {\langle 1 \rangle} ... \nil	→ ...

## 1.6 Tail recursion

\ltx@ReturnAfterFi {\langle 1 \rangle} \fi	→ \fi ⟨ 1 ⟩
\ltx@ReturnAfterElseFi {\langle 1 \rangle} \else {\langle 2 \rangle} \fi	→ \fi ⟨ 1 ⟩

## 1.7 Empty macro

\ltx@empty	→
------------	---

## 1.8 Characters

\ltx@space
\ltx@percentchar
\ltx@backslashchar

## 1.9 Boolean switch

\ltx@newif {\⟨ cmd ⟩}
-----------------------

\ltx@newif defines a new boolean switch ⟨cmd⟩ like \newif. Unlike plain-T<sub>E</sub>X’s \newif, \ltx@newif is not \outer. The command ⟨cmd⟩ must start with the two characters if.

## 1.10 Command definitions

\ltx@ifundefined {\⟨ cmd ⟩} {\⟨ yes ⟩} {\⟨ no ⟩}
--

If ε-T<sub>E</sub>X is available, \ifcsname is used that does not have the side effect of defining undefined commands with meaning of \relax. This command is always expandable. Change in version 1.1: Also the meaning \relax is always considered “undefined”.

\ltx@IfUndefined {\⟨ cmd ⟩} {\⟨ yes ⟩} {\⟨ no ⟩}
--

If ε-T<sub>E</sub>X is available, \ifcsname is used that does not have the side effect of defining undefined commands with meaning of \relax. Also it always checks for the meaning of \relax and considers this as undefined. This macro is not expandable without ε-T<sub>E</sub>X.

\ltx@LocalExpandAfter
-----------------------

It expands the token after the next token but in a local context. That is the difference to \expandafter. The local context discards the side effect of \csname

and let the command undefined after the expansion step.

## 1.11 Stripping

```
\ltx@RemovePrefix  
\ltx@StripPrefix
```

All tokens up to and including the next available character ‘>’ are thrown away. Usually it is used to strip the first part of the output of the commands `\meaning` or `\pdflastmatch`. Macro `\ltx@RemovePrefix` has the same meaning as L<sup>A</sup>T<sub>E</sub>X’s `\strip@prefix`, whereas macro `\ltx@StripPrefix` expands the next token once before stripping the prefix.

## 1.12 File management

All macros in this section are expandable like the counterparts of the L<sup>A</sup>T<sub>E</sub>X kernel. Also they can be used after the preamble.

### 1.12.1 File extensions

```
\ltx@clsextension  
\ltx@pkgextension
```

If `\@clsextension/\@pkgextension` exists then `\ltx@clsextension/\ltx@pkgextension` returns this macro, otherwise the result is `cls/sty`.

### 1.12.2 Load check

```
\ltx@ifclassloaded {\langle class \rangle} {\langle yes \rangle} {\langle no \rangle}  
\ltx@ifpackageloaded {\langle package \rangle} {\langle yes \rangle} {\langle no \rangle}
```

If the `\langle class \rangle/\langle package \rangle` are loaded the macros `\ltx@ifclassloaded/\ltx@ifpackageloaded` call the `\langle yes \rangle` argument. Otherwise `\langle no \rangle` is executed. Both `\langle class \rangle` and `\langle package \rangle` are specified without extension.

```
\ltx@iffileloaded {\langle file \rangle} {\langle yes \rangle} {\langle no \rangle}
```

If L<sup>A</sup>T<sub>E</sub>X’s `\ProvidesFile` macro was called before using `\langle file \rangle` as argument, then `\ltx@iffileloaded` calls `\langle yes \rangle`, otherwise `\langle no \rangle`. Therefore it is possible that the `\langle file \rangle` is loaded, but `\langle no \rangle` is executed because of a missing `\ProvidesFile`. The L<sup>A</sup>T<sub>E</sub>X kernel does not have a counterpart of `\ltx@iffileloaded`.

Note that the file name used in `\ProvidesFile` and `\ltx@iffileloaded` must match. For example, if T<sub>E</sub>X’s default extension `..tex` was given in the first command, then it must also specified in the latter command and vice versa.

### 1.12.3 Version date check

```
\ltx@ifclasslater {\langle class \rangle} {\langle date \rangle} {\langle yes \rangle} {\langle no \rangle}  
\ltx@ifpackagelater {\langle package \rangle} {\langle date \rangle} {\langle yes \rangle} {\langle no \rangle}  
\ltx@iffilelater {\langle file \rangle} {\langle date \rangle} {\langle yes \rangle} {\langle no \rangle}
```

If a `\ProvidesClass/\ProvidesPackage/\ProvidesFile` command with exact the same class/package/file was executed before with an optional argument that starts with a L<sup>A</sup>T<sub>E</sub>X version date, then this version date is compared with the

argument  $\langle date \rangle$ . If they are equal or if the version date is the later date, then  $\langle yes \rangle$  is called. In all other cases  $\langle no \rangle$  is executed.

A L<sup>A</sup>T<sub>E</sub>X date has the format YYYY/MM/DD with YYYY as year with four digits, MM as month with two digits and DD as day with two digits. If pdfT<sub>E</sub>X's `\pdfmatch` is available, then it is used to detect the version date, to reject invalid date formats and to reject some invalid dates. Dates before 1994/01/01 are always invalid, because version dates are introduced with L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  in 1994.

## 1.13 Macro additions

```
\ltx@GlobalAppendToMacro {\langle cmd \rangle} {\langle addition \rangle}
\ltx@LocalAppendToMacro {\langle cmd \rangle} {\langle addition \rangle}
```

The  $\langle addition \rangle$  is appended to the parameterless macro  $\langle cmd \rangle$ . If  $\langle cmd \rangle$  is undefined or has the meaning `\relax`, then it will be initialized as empty macro before.

## 1.14 Macro `\ltx@ifnextchar`

```
\ltx@ifnextchar {\langle char \rangle} {\langle yes \rangle} {\langle no \rangle}
```

If next character is  $\langle char \rangle$  then  $\langle yes \rangle$  is called, otherwise  $\langle no \rangle$ . The character is not removed.

# 2 Implementation

## 2.1 Identification

1  $\langle *package \rangle$

Reload check, especially if the package is not used with L<sup>A</sup>T<sub>E</sub>X.

```

## 4 Installation

### 4.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

[CTAN:macros/latex/contrib/oberdiek/ltxcmds.dtx](http://CTAN:macros/latex/contrib/oberdiek/ltxcmds.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/ltxcmds.pdf](http://CTAN:macros/latex/contrib/oberdiek/ltxcmds.pdf) Documentation.

**Bundle.** All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](http://CTAN:install/macros/latex/contrib/oberdiek.tds.zip)

TDS refers to the standard “A Directory Structure for T<sub>E</sub>X Files” ([CTAN:tds/tds.pdf](http://CTAN:tds/tds.pdf)). Directories with `texmf` in their name are usually organized this way.

### 4.2 Bundle installation

**Unpacking.** Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

---

<sup>1</sup>[ftp://ftp.ctan.org/tex-archive/](http://ftp.ctan.org/tex-archive/)

**Script installation.** Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

### 4.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain-T<sub>E</sub>X:

```
tex ltxcmds.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>ltxcmds.sty</code>	→ <code>tex/generic/oberdiek/ltxcmds.sty</code>
<code>ltxcmds.pdf</code>	→ <code>doc/latex/oberdiek/ltxcmds.pdf</code>
<code>test/ltxcmds-test1.tex</code>	→ <code>doc/latex/oberdiek/test/ltxcmds-test1.tex</code>
<code>ltxcmds.dtx</code>	→ <code>source/latex/oberdiek/ltxcmds.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

### 4.4 Refresh file name databases

If your T<sub>E</sub>X distribution (teT<sub>E</sub>X, mikT<sub>E</sub>X, ...) relies on file name databases, you must refresh these. For example, teT<sub>E</sub>X users run `texhash` or `mktexlsr`.

### 4.5 Some details for the interested

**Attached source.** The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk ltxcmds.pdf unpack_files output .
```

**Unpacking with L<sup>A</sup>T<sub>E</sub>X.** The `.dtx` chooses its action depending on the format:

**plain-T<sub>E</sub>X:** Run `docstrip` and extract the files.

**L<sup>A</sup>T<sub>E</sub>X:** Generate the documentation.

If you insist on using L<sup>A</sup>T<sub>E</sub>X for `docstrip` (really, `docstrip` does not need L<sup>A</sup>T<sub>E</sub>X), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{ltxcmds.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL<sup>A</sup>T<sub>E</sub>X:

```

pdflatex ltxcmds.dtx
makeindex -s gind.ist ltxcmds.idx
pdflatex ltxcmds.dtx
makeindex -s gind.ist ltxcmds.idx
pdflatex ltxcmds.dtx

```

## 5 History

[2009/08/05 v1.0]

- First version.

[2009/12/12 v1.1]

- Short title shortened.
- `\ltx@ifUndefined` added.

[2010/01/28 v1.2]

- `\ltx@RemovePrefix` and `\ltx@StripPrefix` added.
- `\ltx@ifclassloaded`, `\ltx@ifpackageloaded`, `\ltx@iffileloaded`, `\ltx@ifclasslater`, `\ltx@ifpackagelater`, `\ltx@iffilelater`, `\ltx@clsextension`, `\ltx@pkgextension` added.
- `\ltx@GlobalAppendMacro`, `\ltx@LocalAppendMacro` added.

[2010/03/01 v1.3]

- `\ltx@newif` added.
- `\ltx@ifnextchar` added.
- Numbers `\ltx@zero`, `\ltx@one`, `\ltx@two`, `\ltx@cclv` added.

## 6 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
