

The ltxcmds package

Heiko Oberdiek
<oberdiek@uni-freiburg.de>

2010/01/28 v1.2

Abstract

The package `ltxcmds` exports some utility macros from the \LaTeX kernel into a separate namespace and also provides them for other formats such as `plain-TeX`.

1 Documentation

1.1 Introduction

Many of my packages also support other formats such as plain- \TeX . Because I am rather familiar with the utility macros from \LaTeX 's kernel (e.g. \@gobble , \@firstoftwo), I found myself rewriting them again and again, because they are lacking in plain- \TeX .

Therefore this package provides often used macros and similar ones with the name prefix \ltx@ . This avoids also faulty redefinitions. I remember an example where a package redefined \@firstoftwo with forgetting \long .

1.2 Argument killers

\ltx@gobble $\langle 1 \rangle$	\rightarrow
\ltx@gobbletwo $\langle 1 \rangle$ $\langle 2 \rangle$	\rightarrow
\ltx@gobblethree $\langle 1 \rangle$ $\langle 2 \rangle$ $\langle 3 \rangle$	\rightarrow
\ltx@gobblefour $\langle 1 \rangle$ $\langle 2 \rangle$ $\langle 3 \rangle$ $\langle 4 \rangle$	\rightarrow

1.3 Argument grabbers

\ltx@firstofone $\langle 1 \rangle$	\rightarrow	$\langle 1 \rangle$
\ltx@firstoftwo $\langle 1 \rangle$ $\langle 2 \rangle$	\rightarrow	$\langle 1 \rangle$
\ltx@secondoftwo $\langle 1 \rangle$ $\langle 2 \rangle$	\rightarrow	$\langle 2 \rangle$

1.4 List helpers

\ltx@car $\langle 1 \rangle$... \@nil	\rightarrow	$\langle 1 \rangle$
\ltx@cdr $\langle 1 \rangle$... \@nil	\rightarrow	...

1.5 Tail recursion

$\text{\ltx@ReturnAfterFi}$ $\langle 1 \rangle$ \fi	\rightarrow	\fi $\langle 1 \rangle$
$\text{\ltx@ReturnAfterElseFi}$ $\langle 1 \rangle$ \else $\langle 2 \rangle$ \fi	\rightarrow	\fi $\langle 1 \rangle$

1.6 Empty macro

<code>\ltx@empty</code>	→
-------------------------	---

1.7 Characters

<code>\ltx@space</code>
<code>\ltx@percentchar</code>
<code>\ltx@backslashchar</code>

1.8 Command definitions

<code>\ltx@ifundefined {<cmd>} {<yes>} {<no>}</code>
--

If ε -TeX is available, `\ifcsname` is used that does not have the side effect of defining undefined commands with meaning of `\relax`. This command is always expandable. Change in version 1.1: Also the meaning `\relax` is always considered “undefined”.

<code>\ltx@ifundefined {<cmd>} {<yes>} {<no>}</code>
--

If ε -TeX is available, `\ifcsname` is used that does not have the side effect of defining undefined commands with meaning of `\relax`. Also it always checks for the meaning of `\relax` and considers this as undefined. This macro is not expandable without ε -TeX.

<code>\ltx@LocalExpandAfter</code>

It expands the token after the next token but in a local context. That is the difference to `\expandafter`. The local context discards the side effect of `\csname` and let the command undefined after the expansion step.

1.9 Stripping

<code>\ltx@RemovePrefix</code>
<code>\ltx@StripPrefix</code>

All tokens up to and including the next available character ‘>’ are thrown away. Usually it is used to strip the first part of the output of the commands `\meaning` or `\pdfirstmatch`. Macro `\ltx@RemovePrefix` has the same meaning as L^AT_EX’s `\strip@prefix`, whereas macro `\ltx@StripPrefix` expands the next token once before stripping the prefix.

1.10 File management

All macros in this section are expandable like the counterparts of the L^AT_EX kernel. Also they can be used after the preamble.

1.10.1 File extensions

```
\ltx@clsextension  
\ltx@pkgextension
```

If `\@clsextension/\@pkgextension` exists then `\ltx@clsextension/\ltx@pkgextension` returns this macro, otherwise the result is `cls/sty`.

1.10.2 Load check

```
\ltx@ifclassloaded {<class>} {<yes>} {<no>}  
\ltx@ifpackageloaded {<package>} {<yes>} {<no>}
```

If the `<class>/<package>` are loaded the macros `\ltx@ifclassloaded/\ltx@ifpackageloaded` call the `<yes>` argument. Otherwise `<no>` is executed. Both `<class>` and `<package>` are specified without extension.

```
\ltx@iffileloaded {<file>} {<yes>} {<no>}
```

If L^AT_EX's `\ProvidesFile` macro was called before using `<file>` as argument, then `\ltx@iffileloaded` calls `<yes>`, otherwise `<no>`. Therefore it is possible that the `<file>` is loaded, but `<no>` is executed because of a missing `\ProvidesFile`. The L^AT_EX kernel does not have a counterpart of `\ltx@iffileloaded`.

Note that the file name used in `\ProvidesFile` and `\ltx@iffileloaded` must match. For example, if T_EX's default extension `.tex` was given in the first command, then it must also be specified in the latter command and vice versa.

1.10.3 Version date check

```
\ltx@ifclasslater {<class>} {<date>} {<yes>} {<no>}  
\ltx@ifpackagelater {<package>} {<date>} {<yes>} {<no>}  
\ltx@iffilelater {<file>} {<date>} {<yes>} {<no>}
```

If a `\ProvidesClass/\ProvidesPackage/\ProvidesFile` command with exact the same class/package/file was executed before with an optional argument that starts with a L^AT_EX version date, then this version date is compared with the argument `<date>`. If they are equal or if the version date is the later date, then `<yes>` is called. In all other cases `<no>` is executed.

A L^AT_EX date has the format `YYYY/MM/DD` with `YYYY` as year with four digits, `MM` as month with two digits and `DD` as day with two digits. If pdfT_EX's `\pdfmatch` is available, then it is used to detect the version date, to reject invalid date formats and to reject some invalid dates. Dates before 1994/01/01 are always invalid, because version dates are introduced with L^AT_EX 2_ε in 1994.

1.11 Macro additions

```
\ltx@GlobalAppendToMacro {<cmd>} {<addition>}  
\ltx@LocalAppendToMacro {<cmd>} {<addition>}
```

The `<addition>` is appended to the parameterless macro `<cmd>`. If `<cmd>` is undefined or has the meaning `\relax`, then it will be initialized as empty macro before.

2 Implementation

2.1 Identification

```
1 (*package)
```

Reload check, especially if the package is not used with L^AT_EX.

```

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/ltxcmds.dtx](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek/ltxcmds.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/ltxcmds.pdf](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek/ltxcmds.pdf) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek.tds.zip)

TDS refers to the standard “A Directory Structure for \TeX Files” ([CTAN:tds/tds.pdf](https://ctan.org/ctan/packages/tex/texdoc/tex-tds.pdf)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

¹[ftp://ftp.ctan.org/tex-archive/](https://ftp.ctan.org/tex-archive/)

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through `plain-TeX`:

```
tex ltxcmds.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
ltxcmds.sty          → tex/generic/oberdiek/ltxcmds.sty
ltxcmds.pdf          → doc/latex/oberdiek/ltxcmds.pdf
test/ltxcmds-test1.tex → doc/latex/oberdiek/test/ltxcmds-test1.tex
ltxcmds.dtx          → source/latex/oberdiek/ltxcmds.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your `TeX` distribution (`teTeX`, `mikTeX`, ...) relies on file name databases, you must refresh these. For example, `teTeX` users run `texhash` or `mktextlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk ltxcmds.pdf unpack_files output .
```

Unpacking with \LaTeX . The `.dtx` chooses its action depending on the format:

plain-TeX: Run `docstrip` and extract the files.

\LaTeX : Generate the documentation.

If you insist on using \LaTeX for `docstrip` (really, `docstrip` does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{ltxcmds.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with `pdf \LaTeX` :

```
pdflatex ltxcmds.dtx
makeindex -s gind.ist ltxcmds.idx
pdflatex ltxcmds.dtx
makeindex -s gind.ist ltxcmds.idx
pdflatex ltxcmds.dtx
```

5 History

[2009/08/05 v1.0]

- First version.

[2009/12/12 v1.1]

- Short title shortened.
- `\ltx@ifundefined` added.

[2010/01/28 v1.2]

- `\ltx@RemovePrefix` and `\ltx@StripPrefix` added.
- `\ltx@ifclassloaded`, `\ltx@ifpackageloaded`, `\ltx@iffileloaded`, `\ltx@ifclasslater`, `\ltx@ifpackagelater`, `\ltx@iffilelater`, `\ltx@clsextension`, `\ltx@pkgextension` added.
- `\ltx@GlobalAppendMacro`, `\ltx@LocalAppendMacro` added.

6 Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
