

The pdftextcmds package

Heiko Oberdiek
<oberdiek@uni-freiburg.de>

2009/12/12 v0.7

Abstract

LUA_T_EX provides most of the commands of pdf_T_EX 1.40. However a number of utility functions are removed. This package tries to fill the gap and implements some of the missing primitive using Lua.

1 Documentation

Some primitives of pdfTeX are not defined by L^AT_EX. This package implements macro based solutions using Lua code for the following missing pdfTeX primitives;

- \pdfstrcmp
- \pdfunescapehex
- \pdfescapehex
- \pdfescapename
- \pdfescapestring
- \pdffilesize
- \pdffilemoddate
- \pdffiledump
- \pdfmdfivesum
- \immediate\write18

The original names of the primitives cannot be used:

- The syntax for their arguments cannot easily simulated by macros. The primitives using key words such as `file` (\pdfmdfivesum) or `offset` and `length` (\pdffiledump) and uses *⟨general text⟩* for the other arguments. Using token registers assignments, *⟨general text⟩* could be caught. However, the simulated primitives are expandable and register assignments would destroy this important property. (*⟨general text⟩* allows something like `\expandafter\bgroup ...`.)
- The original primitives can be expanded using one expansion step. The new macros need two expansion steps because of the additional macro expansion. Example:

```
\expandafter\foo\pdffilemoddate{file}
vs.
\expandafter\expandafter\expandafter
\foo\pdf@filemoddate{file}
```

L^AT_EX isn't stable yet and thus the status of this package is *experimental*. Feedback is welcome.

1.1 General principles

Naming convention: Usually this package defines a macro `\pdf@⟨cmd⟩` if pdfTeX provides `\pdf⟨cmd⟩`.

Arguments: The order of arguments in `\pdf@⟨cmd⟩` is the same as for the corresponding primitive of pdfTeX. The arguments are ordinary undelimited T_EX arguments, no *⟨general text⟩* and without additional keywords.

Expandibility: The macro `\pdf@⟨cmd⟩` is expandable if the corresponding pdfTeX primitive has this property. Exact two expansion steps are necessary (first is the macro expansion) except for `\pdf@primitive` and `\pdf@ifprimitive`. The latter ones are not macros, but have the direct meaning of the primitive.

Without LuaT_EX: The macros `\pdf@⟨cmd⟩` are mapped to the commands of pdfTeX if they are available. Otherwise they are undefined.

Availability: The macros that the packages provides are undefined, if the necessary primitives are not found and cannot be implemented by Lua.

1.2 Macros

`\pdf@strcmp {<stringA>} {<stringB>}`

Same as `\pdfstrcmp{<stringA>}{<stringB>}`.

`\pdf@unescapehex {<string>}`

Same as `\pdfunescapehex{<string>}`. The argument is a byte string given in hexadecimal notation. The result are character tokens from 0 until 255 with catcode 12 and the space with catcode 10.

`\pdf@escapehex {<string>}`
`\pdf@escapestring {<string>}`
`\pdf@escapename {<string>}`

Same as the primitives of pdfTeX. However pdfTeX does not know about characters with codes 256 and larger. Thus the string is treated as byte string, characters with more than eight bits are ignored.

`\pdf@filesize {<filename>}`

Same as `\pdffilesize{<filename>}`.

`\pdf@filemoddate {<filename>}`

Same as `\pdffilemoddate{<filename>}`.

`\pdf@filedump {<offset>} {<length>} {<filename>}`

Same as `\pdffiledump offset <offset> length <length> {<filename>}`. Both `<offset>` and `<length>` must not be empty, but must be a valid TeX number.

`\pdf@mdfivesum {<string>}`

Same as `\pdfmdfivesum{<string>}`. Keyword `file` is supported by macro `\pdf@filemdfivesum`.

`\pdf@filemdfivesum {<filename>}`

Same as `\pdfmdfivesum file{<filename>}`.

`\pdf@shellescape`

Same as `\pdfshellescape`. It expands to 1 if external commands can be executed and 0 otherwise. In pdfTeX external commands must be enabled first by command line option or configuration option. In LuaTeX option `--safer` disables the execution of external commands.

`\pdf@system {<cmdline>}`

It is a wrapper for `\immediate\write18` in pdfTeX or `os.execute` in LuaTeX.

In theory `os.execute` returns a status number. But its meaning is quite undefined. Are there some reliable properties? Does it make sense to provide an user interface to this status exit code?

`\pdf@primitive \cmd`

Same as `\pdfprimitive` in pdfTeX or L^AT_EX. In XeTeX the primitive is called `\primitive`. Despite the current definition of the command `\cmd`, it's meaning as primitive is used.

`\pdf@ifprimitive \cmd`

Same as `\ifpdfprimitive` in pdfTeX or L^AT_EX. XeTeX calls it `\ifprimitive`. It is a switch that checks if the command `\cmd` has it's primitive meaning.

1.2.1 Additional macro: `\pdf@isprimitive`

`\pdf@isprimitive \cmd1 \cmd2 {\true} {\false}`

If `\cmd1` has the primitive meaning given by the primitive name of `\cmd2`, then the argument `\true` is executed, otherwise `\false`. The macro `\pdf@isprimitive` is expandable. Internally it checks the result of `\meaning` and is therefore available for all T_EX variants, even the original T_EX. Example with L^AT_EX:

```
\makeatletter
\pdf@isprimitive{@@input}{input}{%
  \typeout{\string\@@input\space is original\string\input}%
}%
\typeout{Oops, \string\@@input\space is not the %
        original\string\input}%
}
```

1.2.2 Experimental

`\pdf@unescapehexnative {\string}`
`\pdf@escapehexnative {\string}`
`\pdf@escapepagenative {\string}`
`\pdf@mdfivesumnative {\string}`

The variants without `native` in the macro name are supposed to be compatible with pdfTeX. However characters with more than eight bits are not supported and are ignored. If L^AT_EX is running, then its UTF-8 coded strings are used. Thus the full unicode character range is supported. However the result differs from pdfTeX for characters with eight or more bits.

`\pdf@pipe {\cmdline}`

It calls `\cmdline` and returns the output of the external program in the usual manner as byte string (catcode 12, space with catcode 10). The Lua documentation says, that the used `io.popen` may not be available on all platforms. Then macro `\pdf@pipe` is undefined.

2 Implementation

1 `\package`

2.1 Reload check and package identification

Reload check, especially if the package is not used with L^AT_EX.

175 \fi

```

2.5 \pdf@primitive, \pdf@ifprimitive

Since version 1.40.0 pdf_{TEX} has \pdfprimitive and \ifpdfprimitive. And \pdfprimitive was fixed in version 1.40.4.

Xe_{TEX} provides them under the name \primitive and \ifprimitive. L_AT_EX knows both name variants, but they have possibly to be enabled first (tex.enableprimitives).

Depending on the format TeX Live uses a prefix luatex.

Caution: \let must be used for the definition of the macros, especially because of \ifpdfprimitive.

2.5.1 Using Lua_{TEX}'s tex.enableprimitives

```
176 \ifluatex
```

```
\pdftexcmds@directlua
```

```
177 \ifnum\luatexversion<36 %
178   \def\pdftexcmds@directlua{\directlua0}%
179 \else
180   \let\pdftexcmds@directlua\directlua
181 \fi

182 \begingroup
183   \newlinechar=10 %
184   \endlinechar=\newlinechar
185   \pdftexcmds@directlua{%
186     if tex.enableprimitives then
187       tex.enableprimitives('pdf@', {'primitive', 'ifprimitive'})
188       tex.enableprimitives('', {'luaescapestring'})
189     end
190   }%
191 \endgroup %

192 \fi
```

2.5.2 Trying various names to find the primitives

```
\pdftexcmds@strip@prefix
```

```
193 \def\pdftexcmds@strip@prefix#1>{}

194 \def\pdftexcmds@temp#1#2#3{%

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/pdftexcmds.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/pdftexcmds.pdf](#) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for \TeX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

¹<http://ftp.ctan.org/tex-archive/>

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain- \TeX :

```
tex pdftexcmds.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
pdftexcmds.sty      → tex/generic/oberdiek/pdftexcmds.sty
oberdiek.pdftexcmds.lua → scripts/oberdiek/oberdiek.pdftexcmds.lua
pdftexcmds.lua      → scripts/oberdiek/pdftexcmds.lua
pdftexcmds.pdf      → doc/latex/oberdiek/pdftexcmds.pdf
test/pdftexcmds-test1.tex → doc/latex/oberdiek/test/pdftexcmds-test1.tex
test/pdftexcmds-test2.tex → doc/latex/oberdiek/test/pdftexcmds-test2.tex
pdftexcmds.dtx      → source/latex/oberdiek/pdftexcmds.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your \TeX distribution (te \TeX , mi \TeX , ...) relies on file name databases, you must refresh these. For example, te \TeX users run `texhash` or `mktextlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk pdftexcmds.pdf unpack_files output .
```

Unpacking with \LaTeX . The `.dtx` chooses its action depending on the format:

plain- \TeX : Run `docstrip` and extract the files.

\LaTeX : Generate the documentation.

If you insist on using \LaTeX for `docstrip` (really, `docstrip` does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{pdftexcmds.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex pdftexcmds.dtx
makeindex -s gind.ist pdftexcmds.idx
pdflatex pdftexcmds.dtx
makeindex -s gind.ist pdftexcmds.idx
pdflatex pdftexcmds.dtx
```

5 History

[2007/11/11 v0.1]

- First version.

[2007/11/12 v0.2]

- Short description fixed.

[2007/12/12 v0.3]

- Organization of Lua code as module.

[2009/04/10 v0.4]

- Adaptation for syntax change of `\directlua` in L^AT_EX 0.36.

[2009/09/22 v0.5]

- `\pdf@primitive`, `\pdf@ifprimitive` added.
- Xe_T_EX's variants are detected for `\pdf@shellescape`, `\pdf@strcmp`, `\pdf@primitive`, `\pdf@ifprimitive`.

[2009/09/23 v0.6]

- Macro `\pdf@isprimitive` added.

[2009/12/12 v0.7]

- Short info shortened.

6 Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
