

The `pdftexcmds` package

Heiko Oberdiek

<oberdiek@uni-freiburg.de>

2007/12/12 v0.3

Abstract

LUAT_EX provides most of the commands of pdfT_EX 1.40. However a number of utility functions are removed. This package tries to fill the gap and implements some of the missing primitive using Lua.

1 Documentation

Some primitives of pdfT_EX are not defined by LUAT_EX. This package implements macro based solutions using Lua code for the following missing pdfT_EX primitives;

- `\pdfstrcmp`
- `\pdfunescapehex`

- `\pdfescapehex`
- `\pdfescapename`
- `\pdfescapestring`
- `\pdffilesize`
- `\pdffilemoddate`
- `\pdffiledump`
- `\pdfmdfivesum`
- `\immediate\write18`

The original names of the primitives cannot be used:

- The syntax for their arguments cannot easily simulated by macros. The primitives using key words such as `file` (`\pdfmdfivesum`) or `offset` and `length` (`\pdffiledump`) and uses `general text` for the other arguments. Using token registers assignments, `general text` could be catched. However, the simulated primitives are expandable and register assignments would destroy this important property. (`general text` allows something like `\expandafter\bgroup ...`).
 - The original primitives can be expanded using one expansion step. The new macros need two expansion steps because of the additional macro expansion.
- Example:

```
\expandafter\foo\pdffilemoddate{file}
vs. \expandafter\expandafter\expandafter\foo\pdf@filemoddate{file}.
```

LUATEX isn't stable yet and thus the status of this package is *experimental*. Feedback is welcome.

1.1 General principles

Naming convention: Usually this package defines a macro `\pdf@cmd` if pdfTeX provides `\pdfcmd`.

Arguments: The order of arguments in `\pdf@cmd` is the same as for the corresponding primitive of pdfTeX. The arguments are ordinary undelimited TeX arguments, no `general text` and without additional keywords.

Expandability: The macro `\pdf@cmd` is expandable if the corresponding pdfTeX primitive has this property. Exact two expansion steps are necessary (first is the macro expansion).

Without LuaTeX: The macros `\pdf@cmd` are mapped to the commands of pdfTeX if they are available. Otherwise they are undefined.

1.2 Macros

`\pdf@strcmp {stringA} {stringB}`

Same as `\pdfstrcmp{stringA}{stringB}`.

`\pdf@unescapehex {string}`

Same as `\pdfunescapehex{string}`. The argument is a byte string given in hexadecimal notation. The result are character tokens from 0 until 255 with catcode 12 and the space with catcode 10.

```
\pdf@escapehex {\langle string\rangle}
\pdf@escapestring {\langle string\rangle}
\pdf@escapename {\langle string\rangle}
```

Same as the primitives of pdf_{TEX}. However pdft_{EX} does not know about characters with codes 256 and larger. Thus the string is treated as byte string, characters with more than eight bits are ignored.

```
\pdf@filesize {\langle filename\rangle}
```

Same as \pdffilesize{\langle filename\rangle}.

```
\pdf@filemoddate {\langle filename\rangle}
```

Same as \pdffilemoddate{\langle filename\rangle}.

```
\pdf@filedump {\langle offset\rangle} {\langle length\rangle} {\langle filename\rangle}
```

Same as \pdffiledump *offset* {\langle offset\rangle} *length* {\langle length\rangle} {\langle filename\rangle}. Both {\langle offset\rangle} and {\langle length\rangle} must not be empty, but must be a valid _{TEX} number.

```
\pdf@mdfivesum {\langle string\rangle}
```

Same as \pdfmdfivesum{\langle string\rangle}. Keyword *file* is supported by macro \pdf@filemdfivesum.

```
\pdf@filemdfivesum {\langle filename\rangle}
```

Same as \pdfmdfivesum *file*{\langle filename\rangle}.

```
\pdf@shellescape
```

Same as \pdfshellescape. It expands to 1 if external commands can be executed and 0 otherwise. In pdft_{EX} external commands must be enabled first by command line option or configuration option. In LUAT_{EX} option --safer disables the execution of external commands.

```
\pdf@system {\langle cmdline\rangle}
```

It is a wrapper for \immediate\write18 in pdft_{EX} or os.execute in LUAT_{EX}.

In theory os.execute returns a status number. But its meaning is quite undefined. Are there some reliable properties? Does it make sense to provide an user interface to this status exit code?

1.2.1 Experimental

```
\pdf@unescapehexnative {\langle string\rangle}
\pdf@escapehexnative {\langle string\rangle}
\pdf@escapenamenative {\langle string\rangle}
\pdf@mdfivesumnative {\langle string\rangle}
```

The variants without native in the macro name are supposed to be compatible with pdf_{TEX}. However characters with more than eight bits are not supported and are ignored. If LUAT_{EX} is running, then its UTF-8 coded strings are used.

Thus the full unicode character range is supported. However the result differs from pdfTeX for characters with eight or more bits.

```
\pdf@pipe {\cmdline}
```

It calls *<cmdline>* and returns the output of the external program in the usual manner as byte string (catcode 12, space with catcode 10). The Lua documentation says, that the used `io.popen` may not be available on all platforms. Then macro `\pdf@pipe` is undefined.

2 Implementation

```
1 (*package)
```

2.1 Reload check and package identification

Reload check, especially if the package is not used with L^AT_EX.

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/pdftexcmds.dtx](http://CTAN.mirror/macros/latex/contrib/oberdiek/pdftexcmds.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/pdftexcmds.pdf](http://CTAN.mirror/macros/latex/contrib/oberdiek/pdftexcmds.pdf) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](http://CTAN.mirror/install/macros/latex/contrib/oberdiek.tds.zip)

¹[ftp://ftp.ctan.org/tex-archive/](http://ftp.ctan.org/tex-archive/)

TDS refers to the standard “A Directory Structure for \TeX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TD\S:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl  
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain- \TeX :

```
tex pdftexcmds.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>pdftexcmds.sty</code>	→ <code>tex/generic/oberdiek/pdftexcmds.sty</code>
<code>oberdiek.pdftexcmds.lua</code>	→ <code>scripts/oberdiek/oberdiek.pdftexcmds.lua</code>
<code>pdftexcmds.lua</code>	→ <code>scripts/oberdiek/pdftexcmds.lua</code>
<code>pdftexcmds.pdf</code>	→ <code>doc/latex/oberdiek/pdftexcmds.pdf</code>
<code>pdftexcmds.dtx</code>	→ <code>source/latex/oberdiek/pdftexcmds.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your \TeX distribution (`teTeX`, `mikTeX`, ...) relies on file name databases, you must refresh these. For example, `teTeX` users run `texhash` or `mktexlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk pdftexcmds.pdf unpack_files output .
```

Unpacking with \LaTeX . The `.dtx` chooses its action depending on the format:

plain- \TeX : Run `docstrip` and extract the files.

\TeX : Generate the documentation.

If you insist on using \LaTeX for `docstrip` (really, `docstrip` does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{pdftexcmds.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex pdftexcmds.dtx
makeindex -s gind.ist pdftexcmds.idx
pdflatex pdftexcmds.dtx
makeindex -s gind.ist pdftexcmds.idx
pdflatex pdftexcmds.dtx
```

5 History

[2007/11/11 v0.1]

- First version.

[2007/11/12 v0.2]

- Short description fixed.

[2007/12/12 v0.3]

- Organization of Lua code as module.
