

The `pdftexcmds` package

Heiko Oberdiek*
<heiko.oberdiek at googlemail.com>

2018/01/21 v0.26

Abstract

LuaTeX provides most of the commands of pdfTeX 1.40. However a number of utility functions are removed. This package tries to fill the gap and implements some of the missing primitive using Lua.

1 Documentation

Some primitives of pdfTeX [1] are not defined by LuaTeX [2]. This package implements macro based solutions using Lua code for the following missing pdfTeX primitives;

- \pdfstrcmp
- \pdfunescapehex
- \pdfescapehex
- \pdfescapename
- \pdfescapestring
- \pdfffilesize

- `\pdffilemoddate`
- `\pdffiledump`
- `\pdfmdfivesum`
- `\pdfresettimer`
- `\pdfelapsetime`
- `\immediate\write18`

The original names of the primitives cannot be used:

- The syntax for their arguments cannot easily simulated by macros. The primitives using key words such as `file` (`\pdfmdfivesum`) or `offset` and `length` (`\pdffiledump`) and uses `<general text>` for the other arguments. Using token registers assignments, `<general text>` could be catched. However, the simulated primitives are expandable and register assignments would destroy this important property. (`<general text>` allows something like `\expandafter\bgroup ...`.)
 - The original primitives can be expanded using one expansion step. The new macros need two expansion steps because of the additional macro expansion.
- Example:

```
\expandafter\foo\pdffilemoddate{file}
vs.
\expandafter\expandafter\expandafter
\foo\pdf@filemoddate{file}
```

Lua_TE_X isn't stable yet and thus the status of this package is *experimental*. Feedback is welcome.

1.1 General principles

Naming convention: Usually this package defines a macro `\pdf@<cmd>` if pdf_TE_X provides `\pdf<cmd>`.

Arguments: The order of arguments in `\pdf@<cmd>` is the same as for the corresponding primitive of pdf_TE_X. The arguments are ordinary undelimited T_EX arguments, no `<general text>` and without additional keywords.

Expandability: The macro `\pdf@<cmd>` is expandable if the corresponding pdf_TE_X primitive has this property. Exact two expansion steps are necessary (first is the macro expansion) except for `\pdf@primitive` and `\pdf@ifprimitive`. The latter ones are not macros, but have the direct meaning of the primitive.

Without Lua_TE_X: The macros `\pdf@<cmd>` are mapped to the commands of pdf_TE_X if they are available. Otherwise they are undefined.

Availability: The macros that the packages provides are undefined, if the necessary primitives are not found and cannot be implemented by Lua.

1.2 Macros

1.2.1 Strings [1, “7.15 Strings”]

`\pdfstrcmp {<stringA>} {<stringB>}`

Same as `\pdfstrcmp{<stringA>}{<stringB>}`.

```
\pdf@unescapehex {\<string>}
```

Same as `\pdfunescapehex{\<string>}`. The argument is a byte string given in hexadecimal notation. The result are character tokens from 0 until 255 with catcode 12 and the space with catcode 10.

```
\pdf@escapehex {\<string>}  
\pdf@escapestring {\<string>}  
\pdf@escapename {\<string>}
```

Same as the primitives of pdf_TE_X. However pdf_TE_X does not know about characters with codes 256 and larger. Thus the string is treated as byte string, characters with more than eight bits are ignored.

1.2.2 Files [1, “7.18 Files”]

```
\pdf@filesize {\<filename>}
```

Same as `\pdffilesize{\<filename>}`.

```
\pdf@filemoddate {\<filename>}
```

Same as `\pdffilemoddate{\<filename>}`.

```
\pdf@filedump {\<offset>} {\<length>} {\<filename>}
```

Same as `\pdffiledump offset <offset> length <length> {\<filename>}`. Both `<offset>` and `<length>` must not be empty, but must be a valid T_E_X number.

```
\pdf@mdfivesum {\<string>}
```

Same as `\pdfmdfivesum{\<string>}`. Keyword `file` is supported by macro `\pdf@filemdfivesum`.

```
\pdf@filemdfivesum {\<filename>}
```

Same as `\pdfmdfivesum file{\<filename>}`.

1.2.3 Timekeeping [1, “7.17 Timekeeping”]

The timekeeping macros are based on Andy Thomas’ work [3].

```
\pdf@resettimer
```

Same as `\pdfresettimer`, it resets the internal timer.

```
\pdf@elapsedtime
```

Same as `\pdfelapsedtime`. It behaves like a read-only integer. For printing purposes it can be prefixed by `\the` or `\number`. It measures the time in scaled seconds (seconds multiplied with 65536) since the latest call of `\pdf@resettimer` or start of program/package. The resolution, the shortest time interval that can be measured, depends on the program and system.

- pdf_TE_X with `gettimeofday`: $\geq 1/65536$ s

- pdf_{TEX} with `ftime`: $\geq 1\text{ ms}$
- pdf_{TEX} with `time`: $\geq 1\text{ s}$
- Lua_{TEX}: $\geq 10\text{ ms}$
(`os.clock()` returns a float number with two decimal digits in Lua_{TEX} beta-0.70.1-2011061416 (rev 4277)).

1.2.4 Miscellaneous [1, “7.21 Miscellaneous”]

`\pdf@draftmode`

If the _{TEX} compiler knows `\pdfdraftmode` or `\draftmode` (pdf_{TEX}, Lua_{TEX}), then `\pdf@draftmode` returns, whether this mode is enabled. The result is an implicit number: one means the draft mode is available and enabled. If the value is zero, then the mode is not active or `\pdfdraftmode` is not available. An explicit number is yielded by `\number\pdf@draftmode`. The macro cannot be used to change the mode, see `\pdf@setdraftmode`.

`\pdf@ifdraftmode {\langle true \rangle} {\langle false \rangle}`

If `\pdfdraftmode` is available and enabled, `\langle true \rangle` is called, otherwise `\langle false \rangle` is executed.

`\pdf@setdraftmode {\langle value \rangle}`

Macro `\pdf@setdraftmode` expects the number zero or one as `\langle value \rangle`. Zero deactivates the mode and one enables the draft mode. The macro does not have an effect, if the feature `\pdfdraftmode` is not available.

`\pdf@shellescape`

Same as `\pdfshellescape`. It is or expands to 1 if external commands can be executed and 0 otherwise. In pdf_{TEX} external commands must be enabled first by command line option or configuration option. In Lua_{TEX} option `--safer` disables the execution of external commands.

In Lua_{TEX} before 0.68.0 `\pdf@shellescape` is not available due to a bug in `os.execute()`. The argumentless form crashes in some circumstances with segmentation fault. (It is fixed in version 0.68.0 or revision 4167 of Lua_{TEX}. and packported to some version of 0.67.0).

Hints for usage:

- Before its use `\pdf@shellescape` should be tested, whether it is available. Example with package `ltxcmds` (loaded by package `pdftexcmds`):

```
\ltx@ifundefined{\pdf@shellescape}{%
  % \pdf@shellescape is undefined
}{%
  % \pdf@shellescape is available
}
```

Use `\ltx@ifundefined` in expandable contexts.

- `\pdf@shellescape` might be a numerical constant, expands to the primitive, or expands to a plain number. Therefore use it in contexts where these differences does not matter.
- Use in comparisons, e.g.:

```
\ifnum\pdf@shellescape=0 ...
```

- Print the number: \number\pdf@shellescape

```
\pdf@system {\⟨cmdline⟩}
```

It is a wrapper for \immediate\write18 in pdfTeX or os.execute in LuaTeX.

In theory os.execute returns a status number. But its meaning is quite undefined. Are there some reliable properties? Does it make sense to provide an user interface to this status exit code?

```
\pdf@primitive \cmd
```

Same as \pdfprimitive in pdfTeX or LuaTeX. In XeTeX the primitive is called \primitive. Despite the current definition of the command \cmd, it's meaning as primitive is used.

```
\pdf@ifprimitive \cmd
```

Same as \ifpdfprimitive in pdfTeX or LuaTeX. XeTeX calls it \ifprimitive. It is a switch that checks if the command \cmd has it's primitive meaning.

1.2.5 Additional macro: \pdf@isprimitive

```
\pdf@isprimitive \cmd1 \cmd2 {\⟨true⟩} {\⟨false⟩}
```

If \cmd1 has the primitive meaning given by the primitive name of \cmd2, then the argument \langle true \rangle is executed, otherwise \langle false \rangle. The macro \pdf@isprimitive is expandable. Internally it checks the result of \meaning and is therefore available for all TeX variants, even the original TeX. Example with L^AT_EX:

```
\makeatletter
\pdf@isprimitive{@@input}{input}{%
  \typeout{\string @@input\space is original\string input}%
}%
\typeout{Oops, \string @@input\space is not the %
         original\string input}%
}
```

1.2.6 Experimental

```
\pdf@unescapehexnative {\⟨string⟩}
\pdf@escapehexnative {\⟨string⟩}
\pdf@escapenamenative {\⟨string⟩}
\pdf@mdfivesumnative {\⟨string⟩}
```

The variants without native in the macro name are supposed to be compatible with pdfTeX. However characters with more than eight bits are not supported and are ignored. If LuaTeX is running, then its UTF-8 coded strings are used. Thus the full unicode character range is supported. However the result differs from pdfTeX for characters with eight or more bits.

```
\pdf@pipe {\⟨cmdline⟩}
```

It calls \⟨cmdline⟩ and returns the output of the external program in the usual manner as byte string (catcode 12, space with catcode 10). The Lua documen-

tation says, that the used `io.popen` may not be available on all platforms. Then macro `\pdf@pipe` is undefined.

2 Implementation

1 `(*package)`

2.1 Reload check and package identification

Reload check, especially if the package is not used with L^AT_EX.

```

```

2.5 \pdf@primitive, \pdf@ifprimitive

Since version 1.40.0 pdfTeX has \pdfprimitive and \ifpdfprimitive. And \pdfprimitive was fixed in version 1.40.4.

\TeX provides them under the name `\primitive` and `\ifprimitive`. LuaTeX knows both name variants, but they have possibly to be enabled first (`tex.enableprimitives`).

Depending on the format TeX Live uses a prefix `luatex`.

Caution: `\let` must be used for the definition of the macros, especially because of `\ifpdfprimitive`.

2.5.1 Using LuaTeX 's `tex.enableprimitives`

```

226 \ifluatex
\pdftexcmds@directlua
227 \ifnum\luatexversion<36 %
228   \def\pdftexcmds@directlua{\directlua0 }%

2.11.3 Timekeeping [1, “7.17 Timekeeping”]

The functions for timekeeping are based on Andy Thomas’ work [3]. Changes:

- Overflow check is added.
- `string.format` is used to avoid exponential number representation for sure.
- `tex.write` is used instead of `tex.print` to get tokens with catcode 12 and without appended `\endlinechar`.

```

949 local basetime = 0
950 function resettimer()
951   basetime = os.clock()
952 end
953 function elapsedtime()
954   local val = (os.clock() - basetime) * 65536 + .5
955   if val > 2147483647 then
956     val = 2147483647
957   end
958   tex.write(string.format("%d", val))
959 end

```

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/pdfexcmds.dtx](http://ctan.org/pkg/pdfexcmds) The source file.

[CTAN:macros/latex/contrib/oberdiek/pdfexcmds.pdf](http://ctan.org/pkg/pdfexcmds.pdf) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](http://ctan.org/pkg/oberdiek.tds.zip)

TDS refers to the standard “A Directory Structure for TeX Files” ([CTAN:tds/tds.pdf](http://ctan.org/pkg/tds.pdf)). Directories with `texmf` in their name are usually organized this way.

¹<http://ctan.org/pkg/pdfexcmds>

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDs:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl  
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain `TEX`:

```
tex pdftexcmds.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>pdftexcmds.sty</code>	→ <code>tex/generic/oberdiek/pdftexcmds.sty</code>
<code>oberdiek.pdftexcmds.lua</code>	→ <code>scripts/oberdiek/oberdiek.pdftexcmds.lua</code>
<code>pdftexcmds.lua</code>	→ <code>scripts/oberdiek/pdftexcmds.lua</code>
<code>pdftexcmds.pdf</code>	→ <code>doc/latex/oberdiek/pdftexcmds.pdf</code>
<code>test/pdftexcmds-test1.tex</code>	→ <code>doc/latex/oberdiek/test/pdftexcmds-test1.tex</code>
<code>test/pdftexcmds-test2.tex</code>	→ <code>doc/latex/oberdiek/test/pdftexcmds-test2.tex</code>
<code>test/pdftexcmds-test-shell.tex</code>	→ <code>doc/latex/oberdiek/test/pdftexcmds-test-shell.tex</code>
<code>test/pdftexcmds-test-escape.tex</code>	→ <code>doc/latex/oberdiek/test/pdftexcmds-test-escape.tex</code>
<code>pdftexcmds.dtx</code>	→ <code>source/latex/oberdiek/pdftexcmds.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your `TEX` distribution (`teTEX`, `mikTEX`, ...) relies on file name databases, you must refresh these. For example, `teTEX` users run `texhash` or `mktexlsr`.

4.5 Some details for the interested

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain T_EX: Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{pdftexcmds.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdf \TeX :

```
pdflatex pdftexcmds.dtx
bibtex pdftexcmds.aux
makeindex -s gind.ist pdftexcmds.idx
pdflatex pdftexcmds.dtx
makeindex -s gind.ist pdftexcmds.idx
pdflatex pdftexcmds.dtx
```

5 Catalogue

The following XML file can be used as source for the \TeX Catalogue. The elements **caption** and **description** are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is pdftexcmds.xml.

```
1390 <catalogue>
1391 <?xml version='1.0' encoding='us-ascii'?>
1392 <!DOCTYPE entry SYSTEM 'catalogue.dtd'>
1393 <entry datestamp='$Date$' modifier='$Author$' id='pdftexcmds'>

7 History

[2007/11/11 v0.1]

- First version.

[2007/11/12 v0.2]

- Short description fixed.

[2007/12/12 v0.3]

- Organization of Lua code as module.

[2009/04/10 v0.4]

- Adaptation for syntax change of \directlua in LuaTeX 0.36.

[2009/09/22 v0.5]

- \pdf@primitive, \pdf@ifprimitive added.
- XeTeX's variants are detected for \pdf@shellescape, \pdf@strcmp, \pdf@primitive, \pdf@ifprimitive.

[2009/09/23 v0.6]

- Macro \pdf@isprimitive added.

[2009/12/12 v0.7]

- Short info shortened.

[2010/03/01 v0.8]

- Required date for package ifluatex updated.

[2010/04/01 v0.9]

- Use \ifeof18 for defining \pdf@shellescape between pdfTeX 1.21a (inclusive) and 1.30.0 (exclusive).

[2010/11/04 v0.10]

- \pdf@draftmode, \pdf@ifdraftmode and \pdf@setdraftmode added.

[2010/11/11 v0.11]

- Missing \RequirePackage for package ifpdf added.

[2011/01/30 v0.12]

- Already loaded package files are not input in plain TeX.

[2011/03/04 v0.13]

- Improved Lua function shellescape that also uses the result of os.execute() (thanks to Philipp Stephani).

[2011/04/10 v0.14]

- Version check of loaded module added.
- Patch for bug in LuaTeX between 0.40.6 and 0.65 that is fixed in revision 4096.

[2011/04/16 v0.15]

- LuaTeX: `\pdf@shellescape` is only supported for version 0.70.0 and higher due to a bug, `os.execute()` crashes in some circumstances. Fixed in LuaTeX beta-0.70.0, revision 4167.

[2011/04/22 v0.16]

- Previous fix was not working due to a wrong catcode of digit zero (due to easily support the old `\directlua0`). The version border is lowered to 0.68, because some beta-0.67.0 seems also to work.

[2011/06/29 v0.17]

- Documentation addition to `\pdf@shellescape`.

[2011/07/01 v0.18]

- Add Lua module loading in `\everyjob` for initEX (LuaTeX only).

[2011/07/28 v0.19]

- Missing space in an info message added (Martin Münch).

[2011/11/29 v0.20]

- `\pdf@resettimer` and `\pdf@elapsedtime` added (thanks Andy Thomas).

[2016/05/10 v0.21]

- local unpack added (thanks Élie Roux).

[2016/05/21 v0.22]

- adjust `\textbackslash` usage in bib file for biber bug.

[2016/10/02 v0.23]

- add file.close to lua filehandles (github pull request).

[2017/01/29 v0.24]

- Avoid loading luatex-loader for current luatex. (Use pdftexcmds.lua not oberdiek.pdftexcmds.lua to simplify file search with standard require)

[2017/03/19 v0.25]

- New `\pdf@shellescape` for LuaTeX, see github issue 20.

[2018/01/21 v0.26]

- use rb not r mode for file open github issue 34.

8 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
