## Abstract

The **randomwalk** package draws random walks using TikZ. The following parameters can be customized:

- The number of steps, of course.
- The length of the steps, either a fixed length, or a length taken at random from a given set.
- The angle of each step, either taken at random from a given set, or uniformly distributed.

---

\*This file has version number 0.2, last revised 2011/09/09.

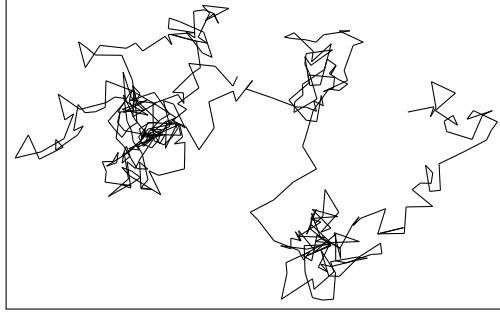

Figure 1: The result of `\RandomWalk{number = 400, length = {4pt, 10pt}}`: a 400 steps long walk, where each step has one of two lengths.

## 1 How to use it

The `randomwalk` package has exactly one user command: `\RandomWalk`, which takes a list of key-value pairs as its argument. A few examples:

```
\RandomWalk {number = 100, length = {4pt, 10pt}}
\RandomWalk {number = 100, angles = {0,60,120,180,240,300}, degree}
\RandomWalk {number = 100, length = 2em,
            angles = {0,10,20,-10,-20}, degree, angles-relative}
```

The simplest is to give a list of all the keys, and their meaning:

- **number:** the number of steps (default 10)
- **length:** the length of each step: either one dimension (e.g., `1em`), or a comma-separated list of dimensions (e.g. `{2pt, 5pt}`), by default `10pt`. The length of each step is a random element in this set of possible dimensions.
- **angles:** the polar angle for each step: a comma-separated list of angles, and each step takes a random angle among the list. If this is not specified, then the angle is uniformly distributed along the circle.
- **degree(s):** specifies that the angles are given in degrees.
- **angles-relative:** instead of being absolute, the angles are relative to the direction of the previous step.

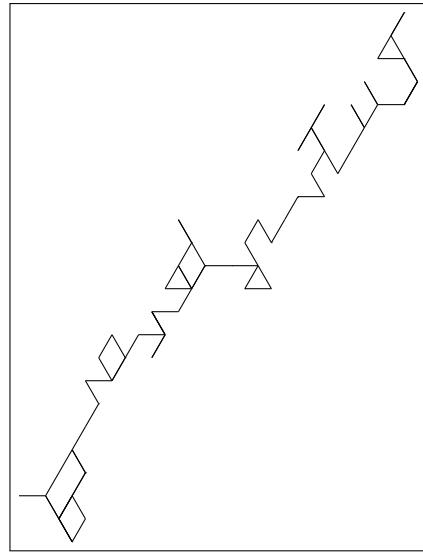

Figure 2: The result of \RandomWalk{number = 100, angles = {0,60,120,180,240,300}, degrees}: angles are constrained.

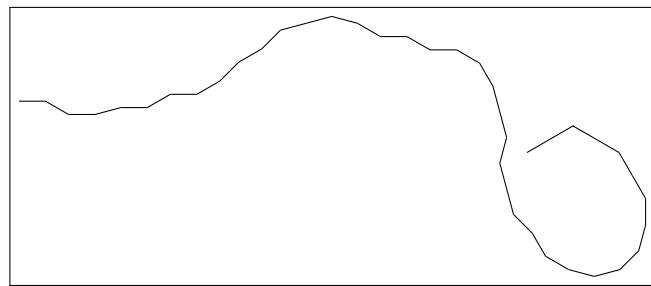

Figure 3: A last example: \RandomWalk {number = 100, length = 2em, angles = {0,10,20,-10,-20}, degree, angles-relative}

## 2 randomwalk implementation

### 2.1 Packages

The whole `expl3` bundle is loaded first, including Joseph Wright's very useful package `13fp.sty` for floating point calculations.

```
<*package>

 1 \ProvidesExplPackage
 2   {\ExplFileName}{\ExplFileVersion}{\ExplFileDescription}
 3 \RequirePackage{exp3}
 4 \RequirePackage{xparse}
```

I use some LaTeX2e packages: TikZ, for figures, and lcg for random numbers.

```
 5 \RequirePackage{tikz}
```

lcg needs to know the smallest and biggest random numbers that it should produce, `\c_rw_lcg_first` and `_last`. It will then store them in `\c@lcg@rand`: the `\c@` is there because of how  $\text{\LaTeX}2_{\varepsilon}$  defines counters. To make it clear that `\c` has a very special meaning here, I do not follow  $\text{\LaTeX}3$  naming conventions.

The lcg package would support a range of  $2^{31} - 1$ , but `13fp` constrains us to 9 digit numbers, so we take the closest available power of 2, namely  $536870911 = 2^{29} - 1$ .

```
 6 \int_const:Nn \c_rw_lcg_first_int {0}
 7 \int_const:Nn \c_rw_lcg_last_int {536870911}
 8 \int_const:Nn \c_rw_lcg_range_int
 9   { \c_rw_lcg_last_int - \c_rw_lcg_first_int }
10 \RequirePackage
11 [
12   first= \c_rw_lcg_first_int,
13   last = \c_rw_lcg_last_int,
14   counter = lcg@rand
15 ]
16 { lcg }
17 \rand % This \rand avoids some very odd bug.
```

We need this constant for fast conversion from degrees to radians later.

```
18 \fp_const:Nn \c_rw_one_degree_fp {+1.74532925e-2}
```

### 2.2 How the key-value list is treated

`\RandomWalk` The only user command is `\RandomWalk`: it simply does the setup, and calls the internal macro `\rw_walk:`.

```
19 \DeclareDocumentCommand \RandomWalk { m }
```

```

20   {
21     \rw_set_defaults:
22     \keys_set:nn { randomwalk } { #1 }
23     \rw_walk:
24   }

```

(End definition for `\RandomWalk`. This function is documented on page ??.)

- `\g_rw_Ado_tl` Currently, the package treats the length of steps, and the angle, completely independently.  
`\g_rw_Ldo_tl` The token list `\g_rw_Ldo_tl` contains the action that should be done to decide the length of the next step, while the token list `\g_rw_Ado_tl` pertains to the angle.

`\rw_set_defaults:` sets the default values before processing the user's key-value input.

```

25 \tl_new:N \g_rw_Ado_tl
26 \tl_new:N \g_rw_Ldo_tl
27 \bool_new:N \l_rw_A_relative_bool
28 \bool_new:N \l_rw_revert_random_bool
29 \cs_new:Npn \rw_set_defaults:
30   {
31     \fp_set:Nn \l_rw_step_length_fp {10}
32     \int_set:Nn \l_rw_step_number_int {10}
33     \tl_gset:Nn \g_rw_Ado_tl { \rw_Ainterval:nn {-\c_pi_fp} {\c_pi_fp} }
34     \tl_gset:Nn \g_rw_Ldo_tl { \rw_Lfixed:n \l_rw_step_length_fp } %^A bug?
35     \bool_set_false:N \l_rw_revert_random_bool
36     \bool_set_false:N \l_rw_A_relative_bool
37   }

```

(End definition for `\g_rw_Ado_tl`. This function is documented on page ??.)

- `\keys_define:nn` We introduce the keys for the package.

```

38 \keys_define:nn { randomwalk }
39   {
40     number .value_required:,
41     length .value_required:,
42     angles .value_required:,
43     number .code:n = {\int_set:Nn \l_rw_step_number_int {#1}},
44     length .code:n =
45     {
46       \clist_set:Nn \l_rw_lengths_clist {#1}
47       \rw_clist_fp_from_dim:N \l_rw_lengths_clist
48       \int_compare:nNnTF { \clist_length:N \l_rw_lengths_clist } = {1}
49         { \tl_gset:Nn \g_rw_Ldo_tl { \rw_Lfixed:n \l_rw_lengths_clist } }
50         { \tl_gset:Nn \g_rw_Ldo_tl { \rw_Llist:N \l_rw_lengths_clist } }
51     },
52     angles .code:n =
53     {
54       \clist_set:Nn \l_rw_angles_clist {#1}
55       \tl_gset:Nn \g_rw_Ado_tl { \rw_Alist:N \l_rw_angles_clist }

```

```

56     },
57     degree .code:n = { \rw_radians_from_degrees:N \l_rw_angles_clist },
58     degrees .code:n = { \rw_radians_from_degrees:N \l_rw_angles_clist },
59     angles-relative .code:n = { \bool_set_true:N \l_rw_A_relative_bool },
60     revert-random .bool_set:N = \l_rw_revert_random_bool,
61 }

```

(End definition for `\keys_define:nn`. This function is documented on page ??.)

## 2.3 Drawing

`\rw_walk:` We are ready to define `\rw_walk:`, which draws a TikZ picture of a random walk with the parameters set up by the `keys`. We reset all the coordinates to zero originally. Then we draw the relevant TikZ picture by repeatedly calling `\rw_step_draw:`.

```

62 \cs_new:Npn \rw_walk:
63 {
64     \fp_zero:N \l_rw_old_x_fp
65     \fp_zero:N \l_rw_old_y_fp
66     \fp_zero:N \l_rw_new_x_fp
67     \fp_zero:N \l_rw_new_y_fp
68     \begin{tikzpicture}
69         \prg_replicate:nn { \l_rw_step_number_int } { \rw_step_draw: }
70         \bool_if:NF \l_rw_revert_random_bool
71             { \int_gset_eq:NN \cr@nd \cr@nd }
72     \end{tikzpicture}
73 }

```

`\cr@nd` is internal to the `lcg` package.

(End definition for `\rw_walk:`. This function is documented on page ??.)

`\rw_step_draw:` `\rw_step_draw:` passes its second argument *with one level of braces removed* to its first argument, responsible for making a random step. Then, `\rw_step_draw:` draws the random step.

```

74 \cs_new:Npn \rw_step_draw:
75 {
76     \g_rw_Ldo_tl
77     \g_rw_Ado_tl
78     \rw_cartesian_from_polar:NNNN
79         \l_rw_step_x_fp \l_rw_step_y_fp
80         \l_rw_radius_fp \l_rw_angle_fp
81     \fp_add:Nn \l_rw_new_x_fp { \l_rw_step_x_fp }
82     \fp_add:Nn \l_rw_new_y_fp { \l_rw_step_y_fp }
83     \draw ( \fp_to_dim:N \l_rw_old_x_fp, \fp_to_dim:N \l_rw_old_y_fp )
84         -- ( \fp_to_dim:N \l_rw_new_x_fp, \fp_to_dim:N \l_rw_new_y_fp );
85     \fp_set_eq:NN \l_rw_old_x_fp \l_rw_new_x_fp
86     \fp_set_eq:NN \l_rw_old_y_fp \l_rw_new_y_fp
87 }

```

(End definition for `\rw_step_draw:`. This function is documented on page ??.)

The next couple of macros store a random floating point in `\l_rw_length_fp` or `\l_rw_angle_fp`.

`\rw_L...:` First for the length of steps.

```
88 \cs_new:Npn \rw_Lfixed:n #1
  { \fp_set:Nn \l_rw_radius_fp {#1} }
90 \cs_new:Npn \rw_Llist:N #1
  { \rw_set_to_random_clist_element:NN \l_rw_radius_fp #1 }
92 \cs_new:Npn \rw_Linterval:nn #1#2
  { \rw_set_to_random_fp:Nnn \l_rw_radius_fp {#1} {#2} }
```

(End definition for `\rw_L...:`. This function is documented on page ??.)

`\rw_A...:` Then for angles.

```
94 \cs_new:Npn \rw_Ainterval:nn #1#2
  {
 95   \bool_if:NTF \l_rw_A_relative_bool
 96     { \rw_add_to_random_fp:Nnn }
 97     { \rw_set_to_random_fp:Nnn }
 98     \l_rw_angle_fp {#1} {#2}
 99   }
100 \cs_new:Npn \rw_Alist:N #1
  {
101   \bool_if:NTF \l_rw_A_relative_bool
102     { \rw_add_to_random_clist_element:NN }
103     { \rw_set_to_random_clist_element:NN }
104     \l_rw_angle_fp #1
105   }
106 }
```

(End definition for `\rw_A...:`. This function is documented on page ??.)

`\rw_cartesian_from_polar:NNNN` The four arguments of `\rw_cartesian_from_polar:NNNN` are  $(x, y, r, \theta)$ : it sets  $(x, y)$  equal to the cartesian coordinates corresponding to a radius  $r$  and an angle  $\theta$ . We also give a version with global assignments.

```
108 \cs_new_protected:Npn \rw_cartesian_from_polar:NNNN #1#2#3#4
  {
109   \fp_cos:Nn #1 {\fp_use:N #4}
110   \fp_sin:Nn #2 {\fp_use:N #4}
111   \fp_mul:Nn #1 {\fp_use:N #3}
112   \fp_mul:Nn #2 {\fp_use:N #3}
113 }
```

```
114 \cs_new_protected:Npn \rw_gcartesian_from_polar:NNNN #1#2#3#4
  {
115   \fp_gcos:Nn #1 {\fp_use:N #4}
116   \fp_gsin:Nn #2 {\fp_use:N #4}
```

```

119      \fp_gmul:Nn #1 {\fp_use:N #3}
120      \fp_gmul:Nn #2 {\fp_use:N #3}
121  }

```

(End definition for `\rw_cartesian_from_polar:NNNN`. This function is documented on page ??.)

We cannot yet do the conversion in the other direction: `13fp.dtx` does not yet provide inverse trigonometric functions. But in fact, we do not need this conversion, so let's stop worrying.

## 2.4 On random numbers etc.

For random numbers, the interface of `lcg` is not quite enough, so we provide our own L<sup>A</sup>T<sub>E</sub>X3y functions. Also, this will allow us to change quite easily our source of random numbers.

```

122 \cs_new:Npn \rw_set_to_random_int:Nnn #1#2#3
123  {
124      \rand
125      \int_set:Nn #1 { \int_mod:nn { \c@lcg@rand } { #3 - (#2) } }
126  }

```

We also need floating point random numbers.

```

127 \cs_new:Npn \rw_set_to_random_fp:Nnn #1#2#3
128  {
129      \fp_set:Nn \l_rw_tmpa_fp {#3}
130      \fp_sub:Nn \l_rw_tmpa_fp {#2}
131      \rand
132      \fp_set:Nn \l_rw_tmpb_fp { \int_use:N \c@lcg@rand }
133      \fp_div:Nn \l_rw_tmpb_fp { \int_use:N \c_rw_lcg_range_int }
134      \fp_mul:Nn \l_rw_tmpa_fp { \l_rw_tmpb_fp }
135      \fp_add:Nn \l_rw_tmpa_fp {#2}
136      \fp_set:Nn #1 { \l_rw_tmpa_fp }
137  }
138 \cs_new:Npn \rw_add_to_random_fp:Nnn #1#2#3
139  {
140      \fp_set:Nn \l_rw_tmpa_fp {#3}
141      \fp_sub:Nn \l_rw_tmpa_fp {#2}
142      \rand
143      \fp_set:Nn \l_rw_tmpb_fp { \int_use:N \c@lcg@rand }
144      \fp_div:Nn \l_rw_tmpb_fp { \int_use:N \c_rw_lcg_range_int }
145      \fp_mul:Nn \l_rw_tmpa_fp { \l_rw_tmpb_fp }
146      \fp_add:Nn \l_rw_tmpa_fp {#2}
147      \fp_add:Nn #1 { \l_rw_tmpa_fp } %here: mod?
148  }

```

We can now pick an element at random from a comma-separated list

```

149 \cs_new:Npn \rw_set_to_random_clist_element:NN #1#2
150 {
151     \rw_set_to_random_int:Nnn \l_rw_tmpb_int {0} { \clist_length:N #2 }
152     \fp_set:Nn #1 { \clist_item:Nn #2 { \l_rw_tmpb_int } }
153 }
154 \cs_new:Npn \rw_add_to_random_clist_element:NN #1#2
155 {
156     \rw_set_to_random_int:Nnn \l_rw_tmpb_int {0} { \clist_length:N #2 }
157     \fp_add:Nn #1 { \clist_item:Nn #2 { \l_rw_tmpb_int } }
158 }

```

## 2.5 Other comma list operations

More stuff on `clist`s.

```

159 \cs_new:Npn \rw_radians_from_degrees:N #1
160 {
161     \clist_clear:N \l_rw_tmpa_clist
162     \clist_map_inline:Nn #1
163     {
164         \fp_set:Nn \l_rw_tmpa_fp {##1}
165         \fp_mul:Nn \l_rw_tmpa_fp { \c_rw_one_degree_fp }
166         \clist_push:NV \l_rw_tmpa_clist \l_rw_tmpa_fp
167     }
168     \clist_set_eq:NN #1 \l_rw_tmpa_clist
169 }
170 \cs_new:Npn \rw_clist_fp_from_dim:N #1
171 {
172     \clist_clear:N \l_rw_tmpa_clist
173     \clist_map_inline:Nn #1
174     {
175         \fp_set_from_dim:Nn \l_rw_tmpa_fp {##1}
176         \clist_push:NV \l_rw_tmpa_clist \l_rw_tmpa_fp
177     }
178     \clist_set_eq:NN #1 \l_rw_tmpa_clist
179 }

```

## 2.6 Variables

We need a bunch of floating point numbers: each step line goes from the `_old` point to the `_new` point. The coordinates `_add` are those of the vector from one to the next, so that `_new = _old + _add`.

```

180 \fp_new:N \l_rw_old_x_fp
181 \fp_new:N \l_rw_old_y_fp
182 \fp_new:N \l_rw_step_x_fp
183 \fp_new:N \l_rw_step_y_fp
184 \fp_new:N \l_rw_new_x_fp

```

```
185 \fp_new:N \l_rw_new_y_fp
186 \fp_new:N \l_rw_angle_fp
187 \int_new:N \l_rw_step_number_int
188 \clist_new:N \l_rw_angles_clist
189 \clist_new:N \l_rw_lengths_clist
190 \fp_new:N \l_rw_tmpa_fp
191 \fp_new:N \l_rw_tmpb_fp
192 \clist_new:N \l_rw_tmpa_clist
193 \int_new:N \l_rw_tmpb_int
```

</package>
