Using LuaLTEX to typeset RTL text with reledpar

Abstract

This file provides an example on how to use reledpar and Lual 4 TeX to typeset a right to left text with its translation on the facing page 1 .

As you can see, the switch to RTL convention is made before the pstart. It must be also called inside **\elebelledsection**.

For an example with XTLATEX, look at parallel-column-two-languages. tex file.
