

reledmac

Typeset scholarly editions with L^AT_EX*

Maïeul Rouquette[†]

based on the original ledmac by
Peter Wilson
Herries Press

which was based on the original edmac, tabmac and edstanza by
John Lavagnino, Dominik Wujastyk, Herbert Breger and Wayne Sullivan.

Abstract

The **reledmac** provides many tools in order to typeset scholarly editions. It is base on the **eledmac** package, which was was based on **ledmac** package, which was based on **edmac** T_EX package.

It can be use in combination with **reledpar** in order to typeset two texts in parallel, like an original text and its translation in modern language.

reledmac provides many tools and options. Normally, they are all documented in this file. Also provided is a help folder, “examples”. The folder contains additional examples (although not for all cases). Example starting by “1-” are for basic uses, those starting by “2-” are for advanced uses.

To report bugs or request a new feature, please go to ledmac GitHub page and click on “New Issue”: <https://github.com/maieul/ledmac/issues/>. You must create an account on github.com to access my page (maieul/ledmac). GitHub accounts are free for open-source users. You can post messages in English or in French (preferred).

You can subscribe to the **reledmac** mail list at:
<http://geekographie.maieul.net/146>

1 Introduction

1.1 Aim of the package

The `reledmac` package, together with `LATEX`, provides several important facilities for formatting critical editions of texts in a traditional manner. Major features include:

- automatic stepped line numbering, by page, section or paragraph;
- sub-lineation within the main series of line numbers;
- variant readings automatically keyed to line numbers;

- caters for both prose and verse;
- multiple series of the footnotes and endnotes;
- block or columnar formatting of the footnotes;
- simple tabular material may be line numbered;
- indexing keyed to page and line numbers.

`reledmac` allows the scholar engaged in preparing a critical edition to focus attention wholly on the task of creating the critical text and evaluating the variant readings, text-critical notes and testimonia. `LATEX` and `Eledmac` will take care of the formatting and visual correlation of all the disparate types of information.

Apart from `reledmac` there are some other `LATEX` packages for critical edition typesetting. However, the aim of `reledmac` is to provide an “all in one” and flexible tool in the field of critical edition.

Any suggestion for new features are welcome.

This manual contains a general description of how to use `reledmac` and the complete source code for the package, with extensive documentation (in sections I and following, numbered in Roman numeric). It ends with a list of actions to do when migrating from some version to other, a change history and an index to the source code.

We do not suggest that you need to read the source code for this package in order to use it; we provide this code primarily for reference, and many of our comments on it repeat material that is also found in the earlier sections.

But no documentation, however thorough, can cover every question that comes up, and many can be answered quickly by consultation of the code. On a first reading, we suggest that you should read only the general documentation in sections 2, unless you are particularly interested in the innards of `reledmac`.

1.2 History

1.2.1 `edmac`

The original version of `edmac` was `TEXTED.TEX`, written by John Lavagnino in late 1987 and early 1988 for formatting critical editions of English plays.

John passed these macros on to Dominik Wujastyk who, in September–October 1988, added the footnote paragraphing mechanism, margin swapping and other changes to suit his own purposes, making the style more like that traditionally used for classical texts in Latin and Greek (e.g., the Oxford Classical Texts series). He also wrote some extra documentation and sent the files out to several people. This version of the macros was the first to be called `edmac`.

The present version was developed in the summer of 1990, with the intent of adding necessary features, streamlining and documenting the code, and further generalizing it to make it easily adaptable to the needs of editors in different disciplines. John did most of the general reworking and documentation, with the financial assistance of the Division of the Humanities and Social Sciences, California Institute of Technology. Dominik adapted the code to the conventions of Frank Mittelbach’s `doc` option, and added some

documentation, multiple-column footnotes, cross-references, and crop marks.¹ A description by John and Dominik of this version of `edmac` was published as ‘An overview of `edmac`: a PLAIN TeX format for critical editions’, *TUGboat* 11 (1990), pp. 623–643.

From 1991 through 1994, the macros continued to evolve, and were tested at a number of sites. We are very grateful to all the members of the (now defunct) `edmac@mailbase.ac.uk` discussion group who helped us with smoothing out bugs and infelicities in the macros. Ron Whitney and our anonymous reviewer at the TUG were both of great help in ironing out last-minute wrinkles, while Ron made some important suggestions which may help to make future versions of `edmac` even more efficient. Wayne Sullivan, in particular, provided several important fixes and contributions, including adapting the Mittelbach/Schöpf ‘New Font Selection Scheme’ for use with PLAIN TeX and `edmac`. Another project Wayne has worked on is a DVI post-processor which works with an `edmac` that has been slightly modified to output `\specials`. This combination enables you to recover to some extent the text of each line, as ASCII code, facilitating the creation of concordances, an *index verborum*, etc.

At the time of writing (1994), we are pleased to be able to say that `edmac` is being used for real-life book production of several interesting editions, such as the Latin texts of Euclid’s *Elements*,² an edition of the letters of Nicolaus Copernicus,³ Simon Bredon’s *Arithmetica*,⁴ a Latin translation by Plato of Tivoli of an Arabic astrolabe text,⁵ a Latin translation of part II of the Arabic *Algebra* by Abū Kāmil Shujā’ b. Aslam,⁶ the Latin *Rithmacha* of Werinher von Tegernsee,⁷ a middle-Dutch romance epic on the Crusades,⁸ a seventeenth-century Hungarian politico-philosophical tract,⁹ an anonymous Latin compilation from Hungary entitled *Sermones Compilati in Studio Gererali Quinqueclesiensi in Regno Ungarie*,¹⁰ the collected letters and papers of Leibniz,¹¹ Theodosius’s *Spherics*, the German *Algorismus* of Sacrobosco, the Sanskrit text of the *Kāśikāvṛtti* of Vāmana and Jayāditya,¹² and the English texts of Thomas Middleton’s collected works.

¹This version of the macros was used to format the Sanskrit text in volume I of *Metarules of Pāṇinian Grammar* by Dominik Wujastyk (Groningen: Forsten, 1993).

²Gerhard Brey used `edmac` in the production of Hubert L. L. Busard and Menso Folkerts, *Robert of Chester’s (?) Redaction of Euclid’s Elements, the so-called Adelard II Version*, 2 vols., (Basel, Boston, Berlin: Birkhäuser, 1992).

³Being prepared at the German Copernicus Research Institute, Munich.

⁴Being prepared by Menso Folkerts *et al.*, at the Institut für Geschichte der Naturwissenschaften in Munich.

⁵Richard Lorch, Gerhard Brey *et al.*, at the same Institute.

⁶Richard Lorch, ‘Abū Kāmil on the Pentagon and Decagon’ in *Vestigia Mathematica*, ed. M. Folkerts and J. P. Hogendijk (Amsterdam, Atlanta: Rodopi, 1993).

⁷Menso Folkerts, ‘Die Rithmacha des Werinher von Tegernsee’, *ibid.*

⁸Geert H. M. Claassens, *De Middelnederlandse Kruisvaartromans*, (Amsterdam: Schiphower en Brinkman, 1993).

⁹Emil Hargittay, *Csáky István: Politica philosophiae Okoskodás-szerint való rendes életnek példája (1664–1674)* (Budapest: Argumentum Kiadó, 1992).

¹⁰Being produced, as was the previous book, by Gyula Mayer in Budapest.

¹¹Leibniz, *Sämtliche Schriften und Briefe*, series I, III, VII, being edited by Dr. H. Breger, Dr. N. Gädeke and others, at the Leibniz-Archiv, Niedersächsische Landesbibliothek, Hannover. (see <http://www.nlb-hannover.de/Leibniz>)

¹²Being prepared at Poona and Lausanne Universities.

1.2.2 ledmac

Version 1.0 of `tabmac` was released by Herbert Breger in October 1996. This added the capability for typesetting tabular material.

Version 0.01 of `edstanza` was released by Wayne Sullivan in June 1992, to help a colleague with typesetting Irish verse.

In March 2003 Peter Wilson started an attempt to port `edmac` from TeX to LaTeX. The starting point was `edmac` version 3.16 as documented on 19 July 1994 (available from CTAN). In August 2003 the `tabmac` functions were added; the starting point for these being version 1.0 of October 1996. The `edstanza` (v0.01) functions were added in February 2004. Sidenotes and regular footnotes in numbered text were added in April 2004.

This port was called `ledmac` (\LaTeX `edmac`).

Since July 2011, `ledmac` is maintained by Maïeul Rouquette. Is it more and more powerful and flexible, but also more and more divergent from original TeX macro.

1.2.3 eledmac

Important changes were put in version 1.0, to make `ledmac` more easily extensible (see 6 p. 28). These changes can trigger small problems with the old customization.

That is why a new name was selected: `eledmac` (extended `ledmac`).

To migrate from `ledmac` to `eledmac`, please read Appendix A.2 p. 287.

1.2.4 reledmac

`eledmac` has facilitated the creation of customized critical edition. However, this was made in a non systematic way in method to customize them.

In other side, many deprecated commands were kept, and many technical debt was accumulated, blocking the future evolution.

For all these reasons, Maïeul Rouquette decided to make a spring cleaning. As some commands name were changed, the ascendant compatibility was (a little) broken.

A new name was selected: `reledmac` (extended renewed `eledmac`).

To migrate from `eledmac` to `reledmac`, please read Appendix A.9 p. 290.

1.3 List of works edited with (r)(e)ledmac

A collaborative list of works edited with (r)(e)ledmac is available on https://www.zotero.org/groups/critical_editions_typeset_with_edmac_ledmac_and_eledmac/items. Please add your own edition made with (r)(e)ledmac.

2 How the package works

The `reledmac` package is a three-pass package like \LaTeX itself. Although your textual apparatus and line numbers will be printed even on the first run, it takes two more passes through \LaTeX to be sure that everything gets to its right place. Any changes you make to the input file may similarly require three passes to get everything to the right

place, if the changes alter the number of lines or notes. `reledmac` will tell you that you need to make more runs, when it notices, but it does not expend the labor to check this thoroughly. If you have problems with a line or two misnumbered at the top of a page, try running `LATEX` once or twice more.

A file may mix *numbered* and *unnumbered* text.

Numbered text is printed with marginal line numbers and can include footnotes and endnotes that are referenced to those line numbers: this is how you will want to print the text that you are editing.

Unnumbered text is not printed with line numbers, and you can't use `reledmac`'s note commands with it: this is appropriate for introductions and other material added by the editor around the edited text.

3 Options

The package can be loaded with a number of global options which are listed here. There are two types of options: options which provide specific features and option which optimize package's performance. It is advised to read the relevant parts of the handbook before reading the first type of option, but you can look at the second type in you first reading of handbook.

3.1 Specific features

`draft` underlines lemmas in the main text.

`eledmac-compat` help to migrate from `eledmac` to `reledmac` (see Appendix A.9.5 p. 291).

`nopbinverse` prevents page break inside verses.

`noquotation` by default, the quotation environment is redefined inside numbered text.
You can disable this redefinition with `noquotation` (see 15 p. 53).

`parapparatus` by default, the apparatus cannot contain paragraph breaks; this option enables paragraphing inside the apparatus.

`xindy` and `xindy+hyperref` are for selecting `xindy` as the index processor (12.3 p. 47).

`widthliketwocolumns` set the width of the text disposed on one column to be the same as the width of the text disposed on two parallel columns with `reledpar`.
This is useful when alternating between normal and parallel typesetting.

3.2 Optimize package's performance

`nocritical` disables tools for critical footnotes (`\Afootnote`, `\Bfootnote` etc.). If you do not need critical footnotes, this option lets `eledmac` run faster. It will also preserve room for other packages.

`noeledsec` disables tools for `\eledsection` and related commands (14.2 p. 52).

noend disables tools for endnotes (\Aendnote, \Bendnote etc.). If you do not need endnotes, this option lets `reledmac` run faster. It will also preserve room for other packages.

nofamiliar disables tools for familiar footnotes (\footnoteA, \footnoteB etc.). If you do not need familiar footnotes, this option lets `reledmac` run faster. It will also preserve room for other packages.

noledgroup `reledmac` allows to use of series of critical notes and new series of normal notes inside minipage and ledgroup environments (see 9 p. 42). However, such features use up computer memory, at the expense of other processing needs. So if you do not need this feature, use `noledgroup` option. This should make `reledmac` faster.

series `reledmac` defines five levels of notes: A, B, C, D, E. Using all these levels consumes memory space and processing speed. This is why, if your work does not require all of the A-E series, you can narrow down the available number of series. For example, if you only need A and B series, call the package with `series={A,B}` option.

4 Text lines and paragraphs numbering

4.1 Text lines numbering

`\beginnumbering`
`\endnumbering`

Each section of numbered text must be preceded by `\beginnumbering` and followed by `\endnumbering`, like this:

```
\beginnumbering
Text
\endnumbering
```

The `\beginnumbering` macro resets the line number to zero, reads an auxiliary file called `<jobname>.nn` (where `<jobname>` is the name of the main input file for this job, and nn is 1 for the first numbered section, 2 for the second section, and so on), and then creates a new version of this auxiliary file to collect information during this run. The first instance of `\beginnumbering` also opens a file called `<jobname>.<series>end` to receive the text of the endnotes. `\endnumbering` closes the `<jobname>.nn` file.

If the line numbering of a text is to be continuous from start to end, then the whole text will be typed between one pair of `\beginnumbering` and `\endnumbering` commands. But your text will most often contain chapter or other divisions marking sections that should be independently numbered, and these will be appropriate places to begin new numbered sections.

`reledmac` has to read and store in memory a certain amount of information about the entire section when it encounters a `\beginnumbering` command, so it speeds up the processing and reduces memory use when a text is divided into a larger number of sections (at the expense of multiplying the number of external files that are generated).

4.2 Paragraphs

4.2.1 Basis

\pstart Within a numbered section, each paragraph of numbered text must be marked using the \pend \pstart and \pend commands like this:

```
\pstart
Paragraph of text.
\pend
```

Text that appears within a numbered section but is not marked with \pstart and \pend will not be numbered.

The following example shows the proper section and paragraph markup, and the kind of output that would typically be generated:

```
\beginnumbering
\pstart
This is a sample paragraph, with
lines numbered automatically.
\pend
```

```
\pstart
This paragraph too has its
lines automatically numbered.
\pend
```

The lines of this paragraph are
not numbered.

```
\pstart
And here the numbering begins
again.
\pend
\endnumbering
```

4.2.2 Producting automatically \pstart...\pend

\autopar You can use \autopar to avoid the nuisance of this paragraph markup and still have every paragraph automatically numbered. The scope of the \autopar command needs to be limited by keeping it within a group, as follows:

```
\begingroup
\beginnumbering
\autopar

A paragraph of numbered text.

Another paragraph of numbered
text.

\endnumbering
\endgroup
```

`\autopar` fails, however, on paragraphs that start with a `{` or with any other command that starts a new group before it generates any text. Such paragraphs need to be started explicitly, before the new group is opened, using `\indent`, `\noindent`, or `\leavevmode`, or using `\pstart` itself.¹³

4.2.3 Content before specific `\pstart` and after specific `\pend`

Both `\pstart` and `\pend` can take a optional argument, in brackets. Its content will be printed before the beginning of `\pstart` / after the end of `\pend` instead of the argument of `\AtEveryPstart` / `\AtEveryPend`. If you need to start a `\pstart` by brackets, or to add brackets after a `\pend`, just add a `\relax` between `\pstart`/`\pend` and the brackets.

This feature is also useful when typesetting verses (see 8 p. 39) or `reledpar` (see 17.7 p. 57).

A `\noindent` is automatically added before this argument.

4.2.4 Content before every `\pstart` and after every `\pend`

`\AtEveryPstart` `\AtEveryPend` You can use both `\AtEveryPstart` and `\AtEveryPend`. Their arguments will be printed before every `\pstart` begins / after every `\pend` ends.

4.2.5 Numbering paragraphs (`\pstart`)

It is possible to insert a number at every `\pstart` command. You must use the `\numberpstarttrue` command to have it. You can stop the numbering with `\numberpstartfalse`. You can redefine the command `\thepstart` to change style. You can change the value of the `pstart` number by using `after \beginnumbering`:

```
\setcounter{numberpstart}{value}
```

On each `\beginnumbering` the numbering restarts.

With the `\sidepstartnumtrue` command, the number of `\pstart` will be printed inside. In this case, the line number will be not printed.

With the `\labelpstarttrue` command, a `\label` added just after a `\pstart` will refer to the number of this `pstart`.

¹³For a detailed study of the reasons for this restriction, see Barbara Beeton, ‘Initiation rites’, *TUGboat* 12 (1991), pp. 257–258.

```
\sidepstartnumtrue
\labelpstarttrue
```

4.2.6 Languages written in Right to Left

If you use languages written in right to left, with $\text{Lua}\text{\TeX}$ or $\text{Xe}\text{\TeX}$, you must switch text direction *before* the $\text{\textbackslash pstart}$ command.

4.2.7 Memory limits

This paragraph is kept for history, but problem described below should not appear with recent version of \TeX .

```
\pausenumbering
\resumenumbering
```

`reledmac` stores a lot of information about line numbers and footnotes in memory as it goes through a numbered section. But at the end of such a section, it empties its memory out, so to speak. If your text has a very long numbered section it is possible that your \TeX may reach its memory limit. There are two solutions to this. The first is to get a larger \TeX with increased memory.

The second solution is to split your long section into several smaller ones. The trouble with this is that your line numbering will start again at zero with each new section. To avoid this problem, we provide $\text{\textbackslash pausenumbering}$ and $\text{\textbackslash resumenumbering}$ which are just like $\text{\textbackslash endnumbering} \dots \text{\textbackslash beginnumbering}$, except that they arrange for your line numbering to continue across the break. Use $\text{\textbackslash pausenumbering}$ only between numbered paragraphs:

```
\beginnumbering
\pstart
Paragraph of text.
\pend
\pausenumbering

\resumenumbering
\pstart
Another paragraph.
\pend
\endnumbering
```

We have defined these commands as two macros, in case you find it necessary to insert text between numbered sections without disturbing the line numbering. But if you are really just using these macros to save memory, you might as well say
 $\text{\newcommand}\{\text{\textbackslash memorybreak}\}\{\text{\textbackslash pausenumbering}\text{\textbackslash resumenumbering}\}$

and say $\text{\textbackslash memorybreak}$ between the relevant $\text{\textbackslash pend}$ and $\text{\textbackslash pstart}$.

4.3 Lineation commands

4.3.1 Disabling lineation

```
\numberlinefalse Line numbering can be disabled with \numberlinefalse. It can be enabled again with
\numberlinetrue \numberlinetrue.
```

4.3.2 Setting lineation start and step

```
\firstlinenum
\linenumincrement
\firstsublinenum
\sblinenumincrement
\linenumberlist
```

By default, reledmac numbers every 5th line. There are two counters, `firstlinenum` and `linenumincrement`, that control this behaviour; they can be changed using `\firstlinenum{<num>}` and `\linenumincrement{<num>}`. `\firstlinenum` specifies the first line that will have a printed number, and `\linenumincrement` is the difference between successive numbered lines. For example, to start printing numbers at the first line and to have every other line numbered:

```
\firstlinenum{1} \linenumincrement{2}
```

There are similar commands, `\firstsublinenum{<num>}` and `\sblinenumincrement{<num>}` for controlling sub-line numbering.

You can define `\linenumberlist` to specify a non-uniform distribution of printed line numbers. For example:

```
\def\linenumberlist{1,2,3,5,7,11,13,17,19,23,29}
```

to have numbers printed on prime-numbered lines only. There must be no spaces within the definition which consists of comma-separated integer numbers. The numbers can be in any order but it is easier to read if you put them in numerical order. Either omitting the definition of `\linenumberlist` or following the vacuous definition

```
\def\linenumberlist{}
```

the standard numbering sequence is applied. The standard sequence is that specified by the combination of the `firstlinenum`, `linenumincrement`, `firstsublinenum` and `linenumincrement` counter values.

4.3.3 Setting lineation reset

```
\lineation
```

Lines can be numbered either by page, by pstart or by section; you specify this using the `\lineation{<arg>}` macro, where `<arg>` is either page, pstart or section.

You may only use this command at places where numbering is not in effect; you can't change the lineation system within a section. You can change it between sections: they don't all have to use the same lineation system. The package's standard setting is `\lineation[section]`. If the lineation is by pstart, the pstart number will be printed before the line number in the notes.

4.3.4 Setting line number margin

```
\linenummargin
```

The command `\linenummargin{<location>}` specifies the margin where the line (or pstart) numbers will be printed. The permissible value for `<location>` is one out of the list `left`, `right`, `inner`, or `outer`, for example `\linenummargin{inner}`. The package's default setting is

```
\linenummargin{left}
```

to typeset the numbers in the left hand margin. You can change this whenever you're not in the middle of making a paragraph.

More precisely, the value of `\linenummargin` used is that in effect at the `\pend` of a numbered paragraph. Apart from an initial setting for `\linenummargin`, only change it after a `\pend`, whereupon it will apply to all following numbered paragraphs, until changed again (changing it between a `\pstart` and `\pend` pair will apply the change to all the current paragraph).

4.3.5 Other settings

`\leftlinenum` When a marginal line number is to be printed, there are a lot of ways to display it.
`\rightlinenum` You can redefine `\leftlinenum` and `\rightlinenum` to change the way marginal line
`\linenumsep` numbers are printed in the left and right margins respectively; the initial versions print
the number in font `\numlabfont` (described below) at a distance `\linenumsep` (initially
set to one pica) from the text.

4.4 Changing the line numbers

Normally the line numbering starts at 1 for the first line of a section and steps up by one for each line thereafter. There are various common modifications of this system, however; the commands described here allow you to put such modifications into effect.

4.4.1 Sublineation

`\startsub` You insert the `\startsub` and `\endsub` commands in your text to turn sub-lineation
`\endsub` on and off. In plays, for example, stage directions are often numbered with sub-line
numbers: as line 10.1, 10.2, 10.3, rather than as 11, 12, and 13. Titles and headings are
sometimes numbered with sub-line numbers as well.

When sub-lineation is in effect, the line number counter is frozen and the sub-line
counter advances instead. If one of these commands appears in the middle of a line,
it doesn't take effect until the next line; in other words, a line is counted as a line or
sub-line depending on what it started out as, even if that changes in the middle.

4.4.2 Locking lineation

`\startlock` The `\startlock` command, used in running text, locks the line number at its current
`\endlock` value, until you say `\endlock`. It can tell for itself whether you are in a patch of line
or sub-line numbering. One use for line-number locking is in printing poetry: there
the line numbers should be those of verse lines rather than of printed lines, even when
a verse line requires several printed lines. But in this case you may use the `\stanza`
mechanism, see 8 p. 39.

`\lockdisp` When line-number locking is used, several printed lines may have the same line
number, and you have to specify whether you want the number attached to the first
printed line or the last, or whether you just want the number printed by them all.
(This assumes that, on the basis of the settings of the previous parameters, it is nec-
essary to display a line number for this line.) You specify your preference using
`\lockdisp{\arg}`; its argument is a word, either `first`, `last`, or `all`. The package
initially sets this as `\lockdisp{first}`.

4.4.3 Setting and changing line number

`\setline` In some cases you may want to modify the line numbers that are automatically cal-
`\advanceline` culated: if you are printing only fragments of a work but want to print line num-
bers appropriate to a complete version, for example. The `\setline{\num}` and
`\advanceline{\num}` commands may be used to change the current line's number

(or the sub-line number, if sub-lineation is currently on). They change both the marginal line numbers and the line numbers passed to the notes. `\setline` takes one argument, the value to which you want the line number set; it must be 0 or greater. `\advanceline` takes one argument, an amount that should be added to the current line number; it may be positive or negative.

`\setlinenum`

The `\setline` and `\advanceline` macros should only be used within a `\pstart...\\pend` group. The `\setlinenum{<num>}` command can be used outside such a group, for example between a `\pend` and a `\pstart`. It sets the line number to `<num>`. It has no effect if used within a `\pstart...\\pend` group.

4.4.4 Line number style

`\linenumberstyle`
`\sublinenumberstyle`

`Alph` Uppercase letters (A ... Z).

`alph` Lowercase letters (a ... z).

`arabic` Arabic numerals (1, 2, ...)

`Roman` Uppercase Roman numerals (I, II, ...)

`roman` Lowercase Roman numerals (i, ii, ...)

Note that with the `Alph` or `alph` styles, ‘numbers’ must be between 1 and 26 inclusive.

Similarly `\sublinenumberstyle{<style>}` can be used to change the numbering style of sub-line numbers, which is normally arabic numerals.

4.4.5 Skipping and hidding number

`\skipnumbering`

When inserted into a numbered line the macro `\skipnumbering` causes the numbering of that particular line to be skipped; that is, the line number is unchanged and no line number will be printed. Note that if you use it in `\stanza`, you must call it at the beginning of the verse.

`\hidenumbering`

When inserted into a numbered line the macro `\hidenumbering` causes the number for that particular line to be hidden; namely, no line number will print. Note that if you use it in `\stanza`, you must call it at the beginning of the verse.

4.4.6 Execute code at each line

`\dolinehook` `\doinsidelinehook`

`reledmac` provides to advanced feature for user. The argument passed to `\dolinehook{<arg>}` will be executed before slicing a new line in the paragraph. The argument passed to `\doinsidelinehook{<arg>}` will be executed before printing a new line. In many case, the latter is more useful than the first. The file `examples/2-line_numbers_in_header.tex` provides an example of use in order to print the first and last line number of a page in the header.

5 Apparatus commands

5.1 Terminology

We call “critical notes” notes which refer to both a lemma, that is a part of text and a line number. Critical notes are subdivided in critical footnotes and critical endnotes.

We call “familiar notes” notes which refer to a footnote mark in the main text.

`reledmac` manages many series of notes of each category. A series of notes is identified by an uppercase letter. When the series letter is at the *beginning* of a command name, it refers to a critical footnote. When the series letter is at the *end* of a command name, it refers to a familiar footnote.

So :

- `\Afootnote` is a critical footnote of the series A.
- `\Bendnote` is a critical endnote of the series B.
- `\footnoteC` is a familiar footnote of the series C.

5.2 Critical notes

5.2.1 The lemma

`\edtext` Within numbered paragraphs, all footnotes and endnotes are generated by the `\edtext` macro:

`\edtext{<lemma>}{<commands>}`

The `<lemma>` argument is the lemma in the main text: `\edtext` both prints this as part of the text, and makes it available to the `<commands>` you specify to generate notes.

For example:

I am happy :	1 I am happy : I saw my friend Smith on
I saw my friend <code>\edtext{Smith}{\Afootnote{Jones C, D.}}</code>	2 Tuesday.
on Tuesday.	<hr/> 1 Smith] Jones C, D.

The lemma `Smith` is printed as part of this sentence in the text, and is also made available to the footnote that specifies a variant, `Jones C, D.` The footnote macro is supplied with the line number at which the lemma appears in the main text.

The `<lemma>` may contain further `\edtext` commands. Nesting makes it possible to print an explanatory note on a long passage together with notes on variants for individual words within the passage. For example:

I am happy : <code>\edtext{I saw my friend \edtext{Smith}{\Afootnote{Jones C, D.}} on Tuesday.}{\Bfootnote{The date was July 16, 1954.}}</code>	1 I am happy : I saw my friend Smith on 2 Tuesday.
	<hr/> 1 Smith] Jones C, D.
	<hr/> 1-2 I saw my friend Smith on Tuesday.] The date was July 16, 1954.

However, \edtext cannot handle overlapping but unnested notes—for example, one note covering lines 10–15, and another covering 12–18; an \edtext that starts in the *<lemma>* argument of another \edtext must end there, too. (The \lemma and \linenum commands may be used to generate overlapping notes if necessary.)

5.2.2 Footnotes

The second argument of the \edtext macro, *<commands>*, may contain a series of subsidiary commands that generate various kinds of notes.

\Afootnote
\Bfootnote
\Cfootnote
\Dfootnote
\Efootnote

Five separate series of the footnotes are maintained; each macro takes one argument like \Afootnote{*<text>*}. When all of the six are used, the A notes appear in a layer just below the main text, followed by the rest in turn, down to the E notes at the bottom. These are the main macros that you will use to construct the critical apparatus of your text.

If you need more series of critical notes, please look at 5.5.1 p. 28.

An optional argument can be added before the text of the footnote. Its value is a comma separated list of options. The available options are:

- **fulllines** to disable \Xtwolines and \Xmorethanwolines features for this note (cf. 6.2.2 p. 30).
- **nonum** to disable line numbering for this note.
- **nosep** to disable the lemma separator for this note.

Example: \Afootnote[nonum]{*<text>*}.

5.2.3 Endnotes

\Aendnote
\Bendnote
\Cendnote
\Dendnote
\Eendnote

The package also maintains five separate series of endnotes.

If you do not need the endnotes facility, you should use **noend** option when loading **reledmac**.

The mechanism is similar to the one for footnotes: each macro takes one or more optional arguments and one single argument, like:

\Aendnote[*<option>*]{*<text>*}.

<option> can contain a comma separated list of values. Allowed values are:

- **fulllines** to disable \Xendtwolines and \Xendmorethanwolines features for this particular note (cf. 6.2.2 p. 30).
- **nonum** to disable line number for this particular note.
- **nosep** to disable the lemma separator for this particular note.

Normally, endnotes are not printed: you must use the \doendnotes{*<s>*}, where *<s>* is the letter of the series to be printed. Put this command where you want the corresponding set of endnotes printed. In this case, all the endnotes of the *<s>* series are printed, for all numbered sections.

\doendnotes
\doendnotesbysection

However, you may want to print the endnotes of one given series covering the first

numbered section, then the endnotes of another given series covering the first numbered section, then the endnotes of the first given series covering the second numbered section, then the endnotes of the second given series covering the second numbered section, and so forth. In this case, use `\doendnotesbysection{<s>}`. For each value of `<s>`, the first call of the command will print the notes for the first series, the second call will print the notes for the second series etc. For example, do:

```
\section{Endnotes}
\subsection{First text}
\doendnotesbysection{A}
\doendnotesbysection{B}
\subsection{Second text}
\doendnotesbysection{A}
\doendnotesbysection{B}
```

Note that by default inside endnotes no separator is used between the lemma and the content. However you can use the `\Xendlemmaseparator` macro to define one (6.3.2 p. 33).

As endnotes may be printed at any point in the document they always start with the page number where they are called. The macro `\printnpnum{<num>}` is used to print these numbers. Its default definition is:

```
\newcommand*{\printnpnum}[1]{p.\#1} }
```

5.2.4 Paragraph in critical apparatus

By default, no paragraph can be made in the notes of critical apparatus. You can allow it by adding the options `parapparatus` when loading the package :

```
\usepackage[parapparatus]{eledmac}
```

5.2.5 Change lemma and line number

`\lemma` If you want to change the lemma that gets passed to the notes, you can do this by using `\lemma{<alternative>}` within the second argument to `\edtext`, before the note commands. The most common use of this command is to abbreviate the lemma that's printed in the notes. For example:

```
I am happy :
\edtext{I saw my friend
\edtext{Smith}{\Afootnote{Jones
C, D.}} on Tuesday.}
{\lemma{I \dots\ Tuesday.
\Bfootnote{The date was
July 16, 1954.}}
}
```

	1 I am happy : I saw my friend Smith on 2 Tuesday. <hr/> 1 Smith] Jones C, D. <hr/> 1-2 I ... Tuesday.] The date was July 16, 1954.
--	--

`\linenum` You can use `\linenum{<arg>}` to change the line numbers passed to the notes. `<arg>` actually consist of seven parameters: the page, line, and sub-line number for the start of

the lemma; the same three numbers for the end of the lemma; and the font specifier for the lemma. As the argument to `\linenum`, you specify those seven parameters in that order, separated by vertical bars (the `|` character). I.e.

```
.\linenum{<start page>}|<s. line>|<s. sub-l.>|<end p.>|<e. l.>|<e. sub-l.>|<font>|}
```

However, you can retain the value computed by `reledmac` for any number by simply omitting it; and you can omit a sequence of vertical bars at the end of the argument. For example, `\linenum{|||23}` changes only the ending page number of the current lemma.

This command does not change the marginal line numbers in any way; it just changes the numbers passed to the notes. Its use comes in situations that `\edtext` has trouble dealing with for whatever reason. If you need notes for overlapping passages that aren't nested, for instance, you can use `\lemma` and `\linenum` to generate such notes despite the limitations of `\edtext`. If the `<lemma>` argument to `\edtext` is extremely long, you may run out of memory; here again you can specify a note with an abbreviated lemma using `\lemma` and `\linenum`. The numbers used in `\linenum` need not be entered manually; you can use the '`x-`' symbolic cross-referencing commands below (10 p. 42) to compute them automatically.

Similarly, being able to manually change the lemma's font specifier in the notes might be important if you were using multiple scripts or languages. The form of the font specifier is three separate codes separated by `/` characters, giving the family, series, and shape codes as defined within NFSS.

5.2.6 Changing the names of commands for critical apparatus

The commands for generating the apparatus have been given rather bland names, because editors in different fields have widely divergent notions of what sort of notes are required, where they should be printed, and what they should be called. But this does not mean you have to type `\Afootnote` when you would rather say something you find more meaningful, like `\variant`.

We recommend that you create a series of such aliases and use them instead of the names chosen here; all you have to do is put commands of this form at the start of your file:¹⁴

```
\newcommandx{\variant}[2][1,usedefault]{\Afootnote[#1]{#2}}
\newcommandx{\explanatory}[2][1,usedefault]{\Bfootnote[#1]{#2}}
\newcommand{\trivial}[1]{\Aendnote{#1}}
\newcommandx{\testimonia}[2][1,usedefault]{\Cfootnote[#1]{#2}}
```

5.3 Disambiguation of identical words in the apparatus

Sometimes, the same word occurs twice (or more) in the same line. `reledmac` provides tools to disambiguate references in the critical notes. The lemma will be followed by a reference number if a given word occurs more than once in the same line.

¹⁴We use `\newcommand` and `\newcommandx` instead of classical `\let` command because the `edtabular` environments have to modify the notes definition, and we need to use the newest definition of notes. Read the handbook of `xargs` to know more about `\newcommandx`.

5.3.1 Basic use

`\sameword` To use this tool, you have to mark every occurrence of the potentially ambiguous term with the `\sameword` command:

```
Lupus \sameword{aut} canis \edtext{\sameword{aut}}{\Afootnote{et}} felix
```

In this example, aut will be followed, in the critical note, by the exponent 2 if it is printed in the same line as the first aut, but it will not if it is printed in a different line. The number is printed only after the second run.

5.3.2 Notes about input encoding with UTF-8 processor

If you use UTF-8 processor, like Xe^T_EX or Lua^T_EX, there should not be any glitches. However, pay attention to how characters are encoded. Similar-looking characters may be represented differently in unicode numbering.

For instance, in Greek, “q” has two possible unicode numbers:

- GREEK SMALL LETTER ALPHA (U+03B1) + COMBINING GREEK YPOGEGRAMMENI (U+0345)
- GREEK SMALL LETTER ALPHA WITH YPOGEGRAMMENI (U+1FB3)

Which unicode number you use depends, many times, on your keyboard configuration (the computer-input system).

Inside `reledmac`, the `\sameword` command considers these two unicodes (code positions) as different characters. If you use only one unicode number consistently, the distinction will probably make no difference to how your text looks, but `\sameword` will process the text inaccurately, based on the unicode numbers. To prevent this, do the following:

- If you use Xe^T_EX, add this line in your preamble: `\XeTeXinputnormalization 1`.
- If you use Lua^T_EX, use the `uninormalize` package of Michal Hoftich¹⁵ with the `buffer` option set to true.

With these tools, Xe^T_EX / Lua^T_EX will dynamically normalize unicode input when reading the file. Consequently, you will have no problems with the `\sameword` command.

5.3.3 Use with `\lemma` command

If you use the `\lemma` command, `reledmac` cannot know to which occurrence of `\sameword` in the first argument of `\edtext` a word marked with `\sameword` in `\lemma` should refer.

For example in the following example:

```
some thing
```

¹⁵<https://github.com/michal-h21/uninormalize>.

```
\edtext{\sameword{sw}
        and other \sameword{sw}
        and again \sameword{sw}
        it is all}%
{\lemma{\sameword{sw} \ldots all}\Afootnote{critical note}}.%
```

`reledmac` cannot know if the “`sw`” in `\lemma` refers to the word after “thing”, after “other”, or after “again”.

Consequently, you have to tell to `reledmac` which instance of `\sameword` in the first argument of `\edtext` you want to reference:

- In the content of `\lemma`, use `\sameword` with no optional argument.
- In the first argument of `\edtext`, use `\sameword` with the optional argument $[\langle X \rangle]$. $\langle X \rangle$ is the depth of the `\edtext` where the `\lemma` is used. So if the `\lemma` is called in a `\edtext` inside another `\edtext`, $\langle X \rangle$ is equal to 2. If the `\lemma` is called in a `\edtext` “of first level”, $\langle X \rangle$ is equal to 1. If the lemma is called in both 1 and 2 `\edtext` depth, $\langle X \rangle$ is 1,2. If that word is referenced in the lemma of every `\edtext` depth, $\langle X \rangle$ can also be set to `inlemma`.

Note that only words that are actually referenced in a `\lemma` need the optional argument. Therefore, the first `\sameword` in the example above should have “1” as its optional argument, to be referenced correctly in the lemma.

Note also that the $\langle X \rangle$ does not refer to the level where the `\sameword` occurs, but to the level of the `\lemma` that refers to that `\sameword`. For example:

```
\edtext{some \edtext{\sameword[1]{word}}{\Afootnote{om. M}}
        and other \sameword{word}
        and again a \sameword{word}
        it is all}%
{\lemma{some \sameword{word} \ldots all}\Afootnote{critical note}}.%
```

Here the `\sameword` occurs in an `\edtext` of level 2, but since it is referenced by `\lemma` on level 1, it has “1” in the optional argument.

In the following example figure, each framed box represents an `\edtext` level. Each number is an occurrence of `\sameword`. After a framed box, the text in superscript represents the content of `\lemma` for that `\edtext` level. The text in subscript at the right of a number represents the content of the optional argument of `\sameword`.

1 _{inlemma}	2	3 ₂	4 _{1..3}	5 _{1..5}
----------------------	---	----------------	-------------------	-------------------

The `\sameword` number 3 is called in a `\lemma` related to an `\edtext` of level 2. It must be marked by “2”.

The `\sameword` number 5 is called in a `\lemma` related to `\edtext` of level 1. It must be marked by “1”.

The `\sameword` number is called in two `\lemma`s: one related to a `\edtext` of level 1, the other related to `\edtext` of level 2. It must be marked by “1,2”. However, as `\lemma` is called only in level 1 and 2, “1,2” could be replaced by “`inlemma`”.

The `\sameword` number “2” is in the first argument of a `\edtext` of level 3, but it has no `\lemma`-command, so there is no need to mark it.

5.3.4 Customizing

`\showwordrank` You can redefine the `\showwordrank` macro to change the way the number is printed. The default value is

```
\newcommand{\showwordrank}[2]{%
  #1\textsuperscript{#2}%
}
```

5.4 Familiar notes

5.4.1 Basic use

`\footnoteA` As well as the standard L^AT_EX footnotes generated via `\footnote`, the package also provides five series of additional footnotes called `\footnoteA` through `\footnoteE`. These have the familiar marker in the text, and the marked text at the foot of the page can be formatted using any of the styles described for the critical footnotes. Note that the ‘regular’ footnotes have the series letter at the end of the macro name whereas the critical footnotes have the series letter at the start of the name.

5.4.2 Customizing mark

`\thefootnoteA` Each series uses a set of macros for styling the marks. The mark numbering scheme of series A is defined by the `\thefootnoteA` macro; the default is:

```
\renewcommand*{\thefootnoteA}{\arabic{footnoteA}}
```

The appearance of the mark in the text is controlled by `\bodyfootmarkA` which is defined as:

```
\newcommand*{\bodyfootmarkA}{%
  \hbox{\textsuperscript{\normalfont\@nameuse{@thefnmarkA}}}}
```

The command `\footfootmarkA` controls the appearance of the mark at the start of the footnote text. It is defined as:

```
\newcommand*{\footfootmarkA}{\textsuperscript{\@nameuse{@thefnmarkA}}}
```

There are similar command triples for the other series.

5.4.3 Separator for multiple footnotes

The `footmisc` package [Fai03] by Robin Fairbairns has an option whereby sequential footnote marks in the text can be separated by commas^{3,4} like so. As a convenience `reledmac` provides this automatically.

`\multfootsep` `\multfootsep` is used as the separator between footnote markers. Its default definition is:

```
\providecommand*{\multfootsep}{\textsuperscript{\normalfont,}}
```

5.5 Changing series

5.5.1 Create a new series

If you need more than five series of critical footnotes you can create extra series, using `\newseries` command. For example to create F and G series `\newseries{G,H}`.

5.5.2 Delete series

As the number of series which are defined increases, `reledmac` gets slower. If you do not need all of the six standard series (A–E), you can load the package with the `series` option. For example if you need only series A and B, use:

```
\usepackage[series={A,B}]{reledmac}
```

5.5.3 Series order

The default series order is the one called with the `series` option of the package, or, if this option is not used, A, B, C, D, E. Series order determines footnotes order.

`seriesatbegin`
`seriesatend`

However in some specific cases, you need to change the series order at some point inside the document. You can use `\seriesatbegin{⟨s⟩}` to pull up a given series `⟨s⟩` to the beginning, or `\seriesatend{⟨s⟩}` to push it down to the end.

5.6 Position of critical and familiar footnotes

`\fnpos` There is a historical incoherence in (r)(e)`ledmac`. The familiar footnotes are before the critical footnotes in a normal page, but after in a minipage or in a ledgroup. However, it is possible to change the relative position of both types of footnotes. If you want to have familiar footnotes after critical footnotes in a normal page, use:

```
\fnpos{critical-familiar}
```

Or, if you want a minipage or ledgroup to have critical footnotes after familiar footnotes, use:

```
\mpfnpos{familiar-critical}
```

6 Critical apparatus appearance

Some commands can be used to change the display of the footnotes. All can have an optional argument `[⟨s⟩]`, which is the letter of the series – or a list of letters separated by comma – depending on which option is applied. If the optional argument is omitted or empty, the setting will concern all series.

When a length, noted `⟨l⟩`, is used, it can be stretchable: `a plus b minus c`. The final length `m` is calculated by `LATEX` to have: $a - c \leq m \leq a + b$. If you use some relative unit¹⁶, it will be relative to fontsize of the footnote, except for commands concerning

¹⁶Like `em` which is the width of a `mg`.

the place kept by the notes — including blank space.

There is also name convention:

- Names prefixed by `X` are for setting of critical footnotes.
- Names prefixed by `Xend` are for setting of critical endnotes.
- Names suffixed by `X` are for setting of familiar footnotes.

6.1 Notes arrangement in a series

`\Xarrangement` By default, all footnotes are formatted as a series of separate paragraphs in one column.
`\arrangementX` Three other formats are also available for notes.

Use `\Xarrangement[⟨s⟩]{⟨a⟩}` to change the arrangement of the ⟨s⟩ series of critical footnotes and `\arrangementX[⟨s⟩]{⟨a⟩}` to change the arrangement of the ⟨s⟩ series of familiar footnotes.

The value of ⟨a⟩ can be one of the following

- `paragraph` formats all the footnotes of a series as a single paragraph;
- `twocol` formats them as separate paragraphs, but in two columns;
- `threecol`, in three columns.
- `normal`, restore normal arrangement.

You should set up the page layout parameters, and in particular the `\baselineskip` of the footnotes, before you call this macro because its action depends on these; too much or too little space will be allotted for the notes on the page if these macros use the wrong values.¹⁷

The notes arrangement must be called after having defined the document geometry setting. If you must change geometry setting inside your document, do not forget to call again note arrangement.

`\hsize` has been set for the pages that use this series of notes; otherwise TeX will try to put too many or too few of these notes on each page. If you need to change the `\hsize` within the document, call the arrangement macro again afterwards to take account of the new value.

6.2 Control line number printing

6.2.1 Print line number only at first time

By default, the line number is printed in every note. If you want to print it only the first time for a given line number (i.e. one time for line 1, one time for line 2 etc.), you can use `\Xnumberonlyfirstinline[⟨s⟩]`.

¹⁷There is one tiny proviso about using paragraphed notes: you should not force any explicit line-breaks inside such notes: do not use `\par`, `\break`, or `\penalty=-10000`. If you must have a line-break for some obscure reason, just suggest the break very strongly: `\penalty=-9999` will do the trick. XII.6.3 p. 147 explains why this restriction is necessary.

```
\Xnumberonlyfirstintwolines
\Xsymlinenum
```

`\Xtwo`lines

`\Xmorethan`twolines

`\Xtwo`linesonlyinsamepage

`\Xend`twolines

`\Xendmorethan`twolines

`\Xendtwo`linesbutnotmore

Use `\Xnumberonlyfirstinline[⟨s⟩][false]` to disable this (⟨s⟩ can be empty if you want to disable it for every series).

Suppose you have a lemma on line 2 and a lemma between line 2 and line 3. With `\Xnumberonlyfirstinline`, the second lemma is considered to be on the same line as the first lemma. But if you use both `\Xnumberonlyfirstinline[⟨s⟩]` and `\Xnumberonlyfirstintwolines[⟨s⟩]`, the distinction is made. Use the command `\Xnumberonlyfirstintwolines[⟨s⟩][false]` to disable this (⟨s⟩ can be empty if you want to disable it for every series). For setting a particular symbol in place of the line number, you can use `\Xsymlinenum[⟨s⟩]{⟨symbol⟩}` in combination with `\Xnumberonlyfirstinline[⟨s⟩]`. From the second lemma of the same line, the symbol will be used instead of the line number. Note that any command called in ⟨symbol⟩ must be robust. Use `\robustify` to robustify a not robust command.

6.2.2 Abbreviate line range

If a lemma is printed on two subsequent lines, `reledmac` will print the first and the last line numbers. Instead of this, it is also possible to print an abbreviation which stands for “line 1 and subsequent line(s)”.

To achieve this, use `\Xtwo`lines[⟨s⟩]{⟨text⟩} and `\Xmorethan`twolines[⟨s⟩]{⟨text⟩}. The ⟨text⟩ argument of `\Xtwo`lines will be printed if the lemma is on two lines, and the ⟨text⟩ argument of `\Xmorethan`twolines will be printed if the lemma is on three or more lines. For example:

```
\Xtwolines{sq.}
\Xmorethantwolines{sqq.}
```

Will print “1sq.” for a lemma which falls on lines 1–2 and “1sqq.” for a lemma which falls on lines 1–4.

If you use `\Xtwo`lines without setting `\Xmorethan`twolines, the ⟨text⟩ argument of `\Xtwo`lines will be used for lemmas which fall on three or more lines.

However, if you want to use a short form (when the lemma overlaps two lines, but not more than two), use `\Xtwo`linesbutnotmore[⟨series⟩].

It is possible to disable this again with `\Xtwo`linesbutnotmore[⟨series⟩][false].

When you use lineation by page, the final page number, if different from the initial page number, will not be printed, because the final page number is included in the `\Xend`twolines symbol.

However, you can force print the final page number with `\Xtwo`linesonlyinsamepage[⟨series⟩].

Use `\Xtwo`linesonlyinsamepage[⟨series⟩][false] to disable this.

You can disable `\Xtwo`lines and related for a specific note by using the ‘[fulllines]’ argument in the note macro cf. 5.2.2 p. 22.

For endnotes, use the macros `\Xend`twolines; `\Xendmorethan`twolines; `\Xendtwo`linesbutnotmore; `\Xendtwo`linesonlyinsamepage instead of `\Xtwo`lines; `\Xmorethan`twolines; `\Xtwo`linesbutnotmore; `\Xtwo`linesonlyinsamepage.

6.2.3 Disable line number

`\Xnonumber` You can use `\Xnonumber[⟨s⟩]` if you do not want to have the line number in a footnote. To cancel it, use `\Xnonumber[⟨s⟩][false]`. `\Xendnonumber[⟨s⟩]` is the same for endnote.

6.2.4 Printing pstart number

`\Xpstart` You can use `\Xpstart[⟨s⟩]` if you want to print the pstart number in the footnote, before the line and subline number. Use `\Xpstart[⟨s⟩][false]` to disable this (*⟨s⟩* can be empty if you want to disable it for every series). Note that when you change the lineation system, the option is automatically switched :

- If you use lineation by pstart, the option is enabled.
- If you use lineation by section or by page, the option is disabled.

`\Xpstarteverytime` By default, the pstart number is printed only in the part of text where you have called `\numberpstarttrue`. We don't know why you would like to print the pstart number in the notes and not in the main text. However, if you want to do it, you can call `\Xpstarteverytime[⟨s⟩]`. In this case, the pstart number will be printed every time in footnote.

`\Xonlypstart` In combination with `\Xpstart`, you can use `\Xonlypstart[⟨s⟩]` if you want to print only the pstart number in the footnote, and not the line and subline number. Use `\Xonlypstart[⟨s⟩][false]` disable this it (*⟨s⟩* can be empty if you want to disable it for every series).

6.2.5 Printing stanza number

`\Xstanza` You can use `\Xstanza[⟨s⟩]` if you want to print the stanza number in the footnote, before the line and subline number. Use `\Xstanza[⟨s⟩][false]` to disable this (*⟨s⟩* can be empty if you want to disable it for every series).

Of course the stanza number is printed only when you use `\numberstanza`

`\Xstanzaseparator` When using `\Xstanza`, you can use `\Xstanzaseparator[⟨s⟩]{⟨text⟩}` to print *⟨text⟩* after the stanza number. Default value is empty.

6.2.6 Space around number

`\Xbeforenumber` With `\Xbeforenumber[⟨s⟩]{⟨l⟩}`, you can add some space before the line number in a footnote. If the line number is not printed, the space is not either. The default value is 0 pt.

`\Xafternumber` With `\Xafternumber[⟨s⟩]{⟨l⟩}` you can add some space after the line number in a footnote. If the line number is not printed, the space is not either. The default value is 0.5 em.

`\Xnonbreakableafternumber` By default, the space defined by `\Xafternumber` is breakable. With `\Xnonbreakableafternumber[⟨s⟩]` it becomes nonbreakable. Use `\Xnonbreakableafternumber[⟨s⟩][false]` to disable this (*⟨s⟩* can be empty if you want to disable it for every series).

6.2.7 Space around line symbol

`\Xbeforesymlinenum`

With `\Xbeforesymlinenum[⟨s⟩]{⟨l⟩}` you can add some space before the line symbol in a footnote. The default value is value set by `\Xbeforenumber`.

`\Xaftersymlinenum`

With `\Xaftersymlinenum[⟨s⟩]{⟨l⟩}` you can add some space after the line symbol in a footnote. The default value is value set by `\Xafternumber`.

6.2.8 Space in place of number

`\Xinplaceofnumber`

If no number or symbolic line number is printed, you can add a space, with `\Xinplaceofnumber[⟨s⟩]{⟨l⟩}`. The default value is 1 em.

`\Xendinplaceofnumber`

`\Xendinplaceofnumber[⟨s⟩]{⟨l⟩}` is the same, for critical endnotes.

6.2.9 Boxing line number and line symbol

`\Xboxlinenum`

It could be useful to put the line number inside a fixed box: the content of the note will be printed after this box. You can use `\Xboxlinenum[⟨s⟩]{⟨l⟩}` to do that. To subsequently disable this feature, use `\Xboxlinenum` with length equal to 0 pt. One use of this feature is to print line number in a column, and the note in an other column:

```
\Xhangindent{1em}
\Xafternumber{0em}
\Xboxlinenum{1em}
```

`\Xboxsymlinenum`

`\Xboxsymlinenum[⟨s⟩]{⟨l⟩}` is the same as `\Xboxlinenum` but for the line number symbol.

`\Xboxlinenumalign`

If you put line number in box, it will be aligned left inside the box. However, you can change it using `\Xboxlinenumalign[⟨s⟩]{⟨text⟩}` where `⟨text⟩` can be the following:

L to align left (default value);

R to align right;

C to center.

When using `\Xboxlinenum`, reledmac put all the line number description in the same box. That is, the same box will contain: the start line number, the dash, and either the end line number or the range symbol (like ff.). However, it is possible to box them in two different boxes.

- `\Xboxstartlinenum[⟨s⟩]{⟨l⟩}` will box the start line number in a box of length `⟨l⟩`. The content will be put at the right of the box.
- `\Xboxendlinenum[⟨s⟩]{⟨l⟩}` will box the dash plus the end line number or the range symbol in a box of length `⟨l⟩`. The content will be put at the left of the box.

With these two commands, it is possible to horizontally align the dash of line number when using critical notes, to obtain something like:

12–23
24ff.

\Xendboxlinenum
\Xendboxlinenumalign
\Xendboxstartlinenumalign
\Xendboxendlinenumalign
\Xendboxlinenum[\langle s \rangle \{ \langle l \rangle \}], \Xendboxlinenumalign[\langle s \rangle \{ \langle text \rangle \}], \Xendboxstartlinenum[\langle s \rangle \{ \langle l \rangle \}], \Xendboxendlinenum[\langle s \rangle \{ \langle l \rangle \}] are the same as, respectively, \Xboxlinenum and \Xboxlinenumalign, \Xboxstartlinenum, \Xboxendlinenum except in endnotes.

6.3 Separator between the lemma and the note

6.3.1 For footnotes

\Xlemmaseparator By default, in a footnote, the separator between the lemma and the note is a right bracket (\rbracket). You can use \Xlemmaseparator[\langle s \rangle \{ \langle Xlemmaseparator \rangle \}] to change it. The optional argument can be used to specify the series in which it is used. Note that there is a non-breakable space between the lemma and the separator, but a **breakable** space between the separator and the following text.

Using \Xbeforelemmaseparator[\langle s \rangle \{ \langle l \rangle \}] you can add some space between lemma and separator. If your lemma separator is empty, this space won't be printed. The default value is 0 em.

Using \Xafterlemmaseparator[\langle s \rangle \{ \langle l \rangle \}] you can add some space between separator and note. If your lemma separator is empty, this space will not be printed. The default value is 0.5 em.

You can suppress the lemma separator, using \Xnolemmaseparator[\langle s \rangle], which is simply a alias of \Xlemmaseparator[\langle s \rangle \{ \}].

With \Xinplaceoflemmaseparator[\langle s \rangle \{ \langle l \rangle \}] you can add a space if no lemma separator is printed. The default value is 1 em.

6.3.2 For endnotes

\Xendlemmaseparator By default, there is no separator inside endnotes between the lemma and the content of the note. You can use \Xendlemmaseparator[\langle s \rangle \{ \langle Xendlemmaseparator \rangle \}] to change this. The optional argument can be used to specify the series in which it is used. A common value of \Xendlemmaseparator is \rbracket.

Note that there is a non-breakable space between the lemma and the separator, but a **breakable** space between the separator and the following text.

Using \Xendbeforelemmaseparator[\langle s \rangle \{ \langle l \rangle \}] you can add some space between the lemma and the separator. If your lemma separator is empty, this space won't be printed. The default value is 0 em.

Using \Xendafterlemmaseparator[\langle s \rangle \{ \langle l \rangle \}] you can add some space between the separator and the content of the note. If your lemma separator is empty, this space won't be printed. The default value is 0.5 em.

With \Xendinplaceoflemmaseparator[\langle s \rangle \{ \langle l \rangle \}] you can add some space if you chose to remove the lemma separator. The default value is 0.5 em.

6.4 Font style

6.4.1 For line number

\Xnotenumfont	\Xnotenumfont[⟨s⟩]{⟨command⟩} is used to change the font style for line numbers in critical footnotes ; ⟨command⟩ must be one (or more) switching command, like \bfseries.
\Xendnotenumfont	\Xendnotenumfont[⟨s⟩]{⟨command⟩} is used to change the font style for line numbers in critical footnotes. ⟨command⟩ must be one (or more) switching command, like \bfseries.
\notenumfontX	\notenumfontX[⟨s⟩]{⟨command⟩} is used to change the font style for note numbers in familiar footnotes. ⟨command⟩ must be one (or more) switching command, like \bfseries.
\Xnotefontsize	\Xnotefontsize[⟨s⟩]{⟨command⟩} is used to define the font size of critical footnotes of the series. The default value is \footnotesize. The ⟨command⟩ must not be a size in pt, but a standard L ^A T _E X size, like \small.
\notefontsizeX	\notefontsizeX[⟨s⟩]{⟨command⟩} is used to define the font size of familiar footnotes of the series. The default value is \footnotesize. The ⟨command⟩ must not be a size in pt, but a standard L ^A T _E X size, like \small.
\Xendnotefontsize	\Xendnotefontsize[⟨s⟩]{⟨l⟩} is used to define the font size of end critical footnotes of the series. The default value is \footnotesize. The ⟨command⟩ must not be a size in pt, but a standard L ^A T _E X size, like \small.

6.4.2 For the lemma

\Xlemmadisablefontselection	By default, font of the lemma in footnote is the same as font of the lemma in the main text. For example, if the lemma is in italic in the main text, it is also in italic in note. The \Xlemmadisablefontselection[⟨s⟩] command allows to disable it for a specific series.
\Xendlemmadisablefontselection	By default, font of the lemma in endnote is the same as font of the lemma in the main text. For example, if the lemma is in italic in the main text, it is also in italic in note. The command allows \Xendlemmadisablefontselection[⟨s⟩] to disable it for a specific series.

6.5 Styles of notes content

\Xparindent	By default, reledmac does not add indentation before the paragraphs inside critical footnotes. Use \Xparindent[⟨s⟩] to enable indentation.
\parindentX	By default, reledmac does not add indentation before the paragraphs inside familiar footnotes. Use \parindentX[⟨s⟩] to enable indentation.
\Xhangindent	For critical notes NOT paragraphed you can define an indent with \Xhangindent[⟨s⟩]{⟨l⟩}, which will be applied in the second line of notes. It can help to make distinction between a new note and a break in a note. The default value is 0 pt.
\hangindentX	For familiar notes NOT paragraphed you can define an indentation with \hangindentX[⟨s⟩]{⟨l⟩}, which will be applied in the second line of notes. It can help to make a distinction between a new note and a break in a note.

6.6 Arbitrary code at the beginning of notes

The three next commands add an arbitrary code at the beginning of notes. As the name's space is local to the notes, you can use it to redefine some style inside the notes. For example, if you don't want the pstart number to be in bold, use :

```
\Xbhooknote{\renewcommand{\thepstart}{\arabic{pstart}.}}
```

`\Xbhooknote` `\Xbhooknote[⟨s⟩]{⟨code⟩}` is to be used at the beginning of the critical footnotes.
`\bhooknoteX` `\bhooknoteX[⟨s⟩]{⟨code⟩}` is to be used at the beginning of the familiar footnotes.
`\Xendbhooknote` `\Xendbhooknote[⟨s⟩]{⟨code⟩}` is to be used at the beginning of the endnotes.

6.7 Options for footnotes in columns

6.7.1 Alignment

`\Xcolalign` `\colalignX` By default, texts in footnotes in two or three columns are flushed left without hyphenation. However, you can change this with `\Xcolalign[⟨s⟩]{⟨code⟩}`, for critical footnotes, and `\colalignX[⟨s⟩]{⟨code⟩}`, for familiar footnotes.

`<code>` must be one of the following command:

`\justifying` to have text justified, as usual with L^AT_EX. You can also let `<code>` empty.

`\raggedright` to have text left aligned, but *without hyphenation*. That is the default reledmac setting.

`\RaggedRight` to have text left aligned *with hyphenation* (requires `ragged2e`).

`\raggedleft` to have text right aligned, but *without hyphenation*.

`\RaggedLeft` to have text right aligned *with hyphenation* (requires `ragged2e`).

`\centering` to have text centered, but *without hyphenation*.

`\Centering` to have text centered *with hyphenation* (requires `ragged2e`).

6.7.2 Size of the columns

For the following four macros, be careful that the columns are made from right to left.

`\Xsizetwocol` `\Xsizetwocol[⟨s⟩]{⟨l⟩}` is used to change width of a column when critical notes are displaying in two columns. Default value is .45 \hspace.

`\Xsizethreecol` `\Xsizethreecol[⟨s⟩]{⟨l⟩}` is used to change width of a column when critical notes are displaying in three columns. Default value is .3 \hspace.

`\hsizetwocol` `\hsizetwocol[⟨s⟩]{⟨l⟩}` is used to change width of a column when familiar notes are displaying in two columns. Default value is .45 \hspace.

`\hsizethreecolX` `\hsizethreecolX[⟨s⟩]{⟨l⟩}` is used to change width of a column when familiar notes are displaying in three columns. Default value is .3 \hspace.

6.8 Options for paragraphed footnotes

6.8.1 Mark separation of notes

`\Xafternote` `\afternoteX`
`\Xparafootsep` `\parafootsepX`

You can add some space after a note by using `\Xafternote[⟨s⟩]{⟨l⟩}` (for critical footnotes) or `\afternoteX[⟨s⟩]{⟨l⟩}` (for familiar footnotes). The default value is `1em plus .4em minus .4em`.

For paragraphed footnotes (see below), you can choose the separator between each note by using `\Xparafootsep[⟨s⟩]{⟨text⟩}` for critical notes and `\parafootsepX` for familiar notes. A common separator is the double pipe (||), which you can set by using `\parafootsep{\parallel}`.

Note that if the symbol defined by `\Xsymlinenum` must be used at the beginning of a note, the `\Xparafootsep` / `\parafootsepX` is not used before this note.

6.8.2 Ragging

`\Xragged` `\raggedX`

Text in paragraphed critical notes is justified, but you can use `\Xragged[⟨s⟩]{L}` if you want it to be ragged left, or `\Xragged[⟨s⟩]{R}` if you want it to be ragged right.

Text in paragraphed footnotes is justified, but you can use `\raggedX[⟨s⟩]{L}` if you want it to be ragged left, or `\raggedX[⟨s⟩]{R}` if you want it to be ragged right.

6.9 Options for block of notes

6.9.1 Text before notes

`\Txtbeforenotes`

You can add some text before critical notes with `\Txtbeforenotes[⟨s⟩]{⟨text⟩}`.

6.9.2 Spacing

`\Xbeforenotes`

You can change the vertical space printed before the rule of the critical notes with `\Xbeforenotes[⟨s⟩]{⟨l⟩}`. The default value is `1.2em plus .6em minus .6em`.

Be careful, the standard L^AT_EX footnote rule, which is used by reledmac, decreases by 3pt. This 3pt decrease is not changed by this command..

You can change the vertical space printed before the rule of the familiar notes with `\beforenotesX[⟨s⟩]{⟨l⟩}`. The default value is `1.2em plus .6em minus .6em`.

Be careful, the standard L^AT_EX footnote rule, which is used by reledmac, decreases 3pt. These 3pt are not changed by this command.

You can set the space before the first series of critical notes printed on each page and set a different amount of space for subsequent the series on the page. You can do it with `\preXnotes{⟨l⟩}`. Default value is `0pt`. You can disable this feature by setting the length to `0pt`.

You can want the space before the first printed (in a page) series of familiar notes not to be the same as before other series. Default value is `0pt`. You can do it with `\prenotesX{⟨l⟩}`. You can disable this feature by setting the length to `0pt`.

6.9.3 Rule

`\Xafterrule` You can change the vertical space printed after the rule of the critical notes with `\Xafterrule[⟨s⟩]{⟨l⟩}`. The default value is 0pt.

Be careful, the standard L^AT_EX footnote rule, which is used by `reledmac`, adds 2.6pt. These 2.6pt are not changed by this command.

`\afterruleX` You can change the vertical space printed after the rule of the familiar notes with `\afterruleX[⟨s⟩]{⟨l⟩}`. The default value is 0pt.

Be careful, the standard L^AT_EX footnote rule, which is used by `reledmac`, adds 2.6pt. These 2.6pt are not changed by this command.

6.9.4 Maximum height

`\Xmaxhnotes` By default, one series of critical notes can take 80% of the page size, before being broken to the next page. If you want to change the size use `\Xmaxhnotes[⟨s⟩]{⟨l⟩}`. Be careful : the length can't be flexible, and is relative to the current font. For example, if you want the note to take, at most, 33% of the text height, do `\Xmaxhnotes{.33\textheight}`.

`\maxhnotesX` `\maxhnotesX[⟨s⟩]{⟨l⟩}` is the same as previous, but for familiar footnotes.

Be careful with the two previous commands. Actually, for technical purposes, one paragraphed note is considered as one block. Consequently, it can not be broken between two pages, even if you used these commands. The debug is in the todolist.

6.10 Footnotes and the `reledpar` columns

If you use `reledpar \columns` macro, you can call :

- `\Xnoteswidthliketwocolumns[⟨s⟩]` to create critical notes with a two-column size width. Use `\Xnoteswidthliketwocolumns[⟨s⟩] [false]` to disable it.
- `\noteswidthliketwocolumnsX[⟨s⟩]` to create familiar notes with a two-column size width. Use `\noteswidthliketwocolumnsX[⟨s⟩] [false]` to disable it.

6.11 Endnotes in one paragraph

`\Xendparagraph` By default, any new endnote starts a new paragraph. Use `\Xendparagraph[⟨s⟩]` to have all end notes of one given series set in one paragraph.

`\Xendafternote` You can add some space after a endnote series by using `\Xendafternote[⟨s⟩]{⟨l⟩}`. The default value is `1em plus .4em minus .4em`.

`\Xendssep` You can choose the separator between each note by `\Xendssep[⟨s⟩]{⟨text⟩}`. A common separator is the double pipe (||), which you can set by using `\Xendssep{\parallel}`.

7 Fonts

One of the most important features of the appearance of the notes, and indeed of your whole document, will be the fonts used. We will first describe the commands that give

you control over the use of fonts in the different structural elements of the document, especially within the notes, and then in subsequent sections specify how these commands are used.

For those who are setting up for a large job, here is a list of the complete set of `reledmac` macros relating to fonts that are intended for manipulation by the user: `\endashchar`, `\fullstop`, `\numlabfont`, and `\rbracket`.

`\numlabfont`
`\endashchar`
`\fullstop`
`\rbracket`

Line numbers for the main text are usually printed in a smaller font in the margin. The `\numlabfont` macro is provided as a standard name for that font: it is initially defined as
`\newcommand{\numlabfont}{\normalfont\scriptsize}`
You might wish to use a different font if, for example, you preferred to have these line numbers printed using old-style numerals.

A relatively trivial matter relates to punctuation. In your footnotes, there will sometimes be spans of line numbers like this: 12–34, or lines with sub-line numbers like this: 55.6. The en-dash and the full stop are taken from the same font as the numbers, and it all works nicely. But what if you wanted to use old-style numbers, like 12 and 34? These look nice in an edition, but when you use the fonts provided by PLAIN \TeX they are taken from a math font which does not have the en-dash or full stop in the same places as a text font. If you (or your macros) just typed `$\oldstyle 12--34$` or `$\oldstyle 55.6$` you would get ‘12>34’ and ‘55>6’. So we define `\endashchar` and `\fullstop`, which produce an en-dash and a full stop respectively from the normal document font, whatever font you are using for the numbers. These two macros are used in the macros which format the line numbers in the margins and footnotes, instead of explicit punctuation. We also define an `\rbracket` macro for the right square bracket printed at the end of the lemma in many styles of textual notes (including `reledmac`’s standard style). For `polyglossia`, when the lemma is RTL, the bracket automatically switches to a left bracket.

`\select@lemmafont`

We will briefly discuss `\select@lemmafont` here because it is important to know about it now, although it is not one of the macros you would expect to change in the course of a simple job. Hence it is ‘protected’ by having the @-sign in its name.

When you use the `\edtext` macro to mark a word in your text as a lemma, that word will normally be printed again in your apparatus. If the word in the text happens to be in a font such as italic or bold you would probably expect it to appear in the apparatus in the same font. This becomes an absolute necessity if the font is actually a different script, such as Arabic or Cyrillic. `\select@lemmafont` does the work of decoding `reledmac`’s data about the fonts used to print the lemma in the main text and calling up those fonts for printing the lemma in the note.

`\select@lemmafont` is a macro that takes one long argument—the cluster of line numbers passed to the note commands. This cluster ends with a code indicating what fonts were in use at the start of the lemma. `\select@lemmafont` selects the appropriate font for the note using that font specifier.

`reledmac` uses `\select@lemmafont` in a standard footnote format macro called `\normalfootfmt`. The footnote formats for each of the layers A to E are `\let` equal to `\normalfootfmt`. So all the layers of the footnotes are formatted in the same way.

8 Verse

8.1 Basic

`\stanza` Use `\stanza` at the start of a stanza. Each line in a stanza is ended by an ampersand (&), and the stanza itself is ended by putting `\&` at the end of the last line.

8.2 Define stanza indents

`\stanzaindentbase` Lines within a stanza may be indented. The indents are integer multiples of the length `\stanzaindentbase`, whose default value is 20pt.

`\setstanzaindents` In order to use the stanza macros, **one must set the indentation values**. First the value of `\stanzaindentbase` should be set, unless the default value 20pt is desired. Every stanza line indentation is a multiple of this.

To specify these multiples one invokes, for example

`\setstanzaindents{3,1,2,1,2}.`

The numerical entries must be whole numbers, 0 or greater, separated by commas without embedded spaces. The first entry gives the hanging indentation to be used if the stanza line requires more than one print line.

If it is known that each stanza line will fit in one print line, then this first entry should be 0; TeX does less work in this case, but no harm ensues if the hanging indentation is not 0 but is never used.

If you want the hanging verse to be flush right, you can use `\sethanginsymbol`: see p. 8.6 p. 41.

Enumeration is by stanza lines, not by print lines. In the above example the lines are indented one unit, two units, one unit, two units, with 3 units of hanging indentation in case a stanza line is too long to fit on one print line.

8.3 Repeating stanza indents

Since version 0.13, if the indentation is repeated every n verses of the stanza, you can define only the n first indentations, and say they are repeated, defining the value of the `stanzaindentsrepetition` counter at n . For example:

```
\setstanzaindents{5,1,0}
\setcounter{stanzaindentsrepetition}{2}
```

is like

```
\setstanzaindents{5,1,0,1,0,1,0,1,0,1,0}
```

Be careful: the feature is changed in elemac 1.5.1. See Appendix A.3 p. 288.

If you don't use the `stanzaindentsrepetition` counter, make sure you have at least one more numerical entry in `\setstanzavalue`s than the number of lines in the stanza.

If you want to disable this feature again, just put the counter to 0:

```
\setcounter{stanzaindentrepeatition}{0}
```

The macros make no restriction on the number of lines in a stanza. Stanza indentation values (and penalty values) obey TeX's grouping conventions, so if one stanza among several has a different structure, its indentations (penalties) may be set within a group; the prior values will be restored when the group ends.

8.4 Manual stanza indent

```
\stanzaindent
\stanzaindent*
```

You can set the indent of some specific verse by calling `\stanzaindent{<value>}` at the beginning of the verse, before any other character. In this case, the indent defined by `\setstanzaindent` for this verse is skipped, and `{<value>}` is used instead.

If you use the mechanism of indent repetition, the next verse will be printed as it should be even if the current verse would have its normal indent value. In other words, using `\stanzaindent` in a verse does not shift the indent repetition.

However, if you want to shift the indent repetition, so the next verse has the indent normally used for the current verse, use `\stanzaindent*` instead of `\stanzaindent`.

8.5 Stanza breaking

```
\setstanzapenalties
```

When the stanzas run over several pages, it is often desirable that page breaks should arise between certain lines in the stanza, so a facility for including penalties after stanza lines is provided. If you are satisfied with the page breaks, you need not set the penalty values.

The command

```
\setstanzapenalties{1,5000,10100,5000,0}
```

results in a penalty of 5000 being placed after the first and third lines of the stanza, and a penalty of -100 after the second.

The first entry “1” is a control value. If it is zero, then no penalties are passed on to TeX, which is the default. Values between 0 and 10000 are penalty values; values between 10001 and 20000 have 10000 subtracted and the result is given as a negative penalty. The mechanism used for indentations and penalties requires unsigned values less than 32768. No penalty is placed after the last line, so the final `,0` in the example above could be omitted. A penalty of 10000 will prevent a page break; such a penalty is included automatically where there is stanza hanging indentation. A penalty of -10000 (corresponding to the entry value 20000 in this context) forces a page break. Values in between act as suggestions as to the desirability of a page break at a given line. There is a subtle interaction between penalties and *glue*, so it may take some adjustment of skips and penalties to achieve the best results.

8.6 Hanging symbol

```
\sethangingsymbol
```

It is possible to insert a symbol in each line of hanging verse, as in French typography for example the opening bracket [. To insert it in `reledmac`, use macro `\sethangingsymbol{<h>}` with this code. In the example of French typography, do

```
\sethangingsymbol{[\,]}
```

You can also use it to force hanging verse to be flush right:

```
\sethangingsymbol{\protect\hfill}
```

8.7 Long verse and page break

If you want to prevent page breaks inside long verses, use the option `nopbinverse` when loading package, or use `\lednopbinversetrue`. Read 16.2 p. 53 for further details.

8.8 Content before/after verses

It is possible to add content, like a subtitle or a spacing, before or after verse:

- `\stanza` command can take a optional argument (in brackets). Its content will be printed before the stanza.
- `&` can be replaced by `\newverse` with two optional arguments (in brackets). The first will be printed after the current verse, the second before the next verse.
- `\&` can take a optional argument (in brackets). Its content will be printed after the stanza.

8.9 Numbering stanza

`\numberstanzatrue` If you want to automatically number stanzas, use `\numberstanzatrue`. In this case, `\numberstanzafalse` the line number will restart at each `\stanza`.

If you want to disable this feature again, use `\numberstanzafalse`.

You can use this feature in combination with `\Xstanza` (6.2.5 p. 31).

`\thestanza` . You can redefine `\thestanza` to change the aspect of stanza number. Default value is:

```
\renewcommand{\thestanza}{%
  \textbf{\arabic{stanza}}}
```

`\stanzanumwrapper` You can change the value of the `stanza` counter with the usual commands of L^AT_EX.

`\stanzanumwrapper` You can redefine `\stanzanumwrapper` in order to modify the way the stanza number is inserted in the flow of text. Default value is:

```
\newcommand{\stanzanumwrapper}[1]{%
  \flagstanza{#1}}
```

8.10 Various tools

`\ampersand` If you need to print an & symbol in a stanza, use the `\ampersand` macro, not `\&` which will end the stanza.

`\flagstanza[<len>]{<text>}` Putting `\flagstanza[<len>]{<text>}` at the start of a line in a stanza (or elsewhere) will typeset `<text>` at a distance `<len>` before the line. The default `<len>` is `\stanzaindentbase`.

9 Grouping

In a `minipage` environment L^AT_EX changes `\footnote` numbering from arabic to alphabetic and puts the footnotes at the end of the minipage.

`minipage` You can put numbered text with critical footnotes in a `minipage` and the footnotes are set at the end of the `minipage`.

You can also put familiar footnotes (see section 5.4) in a `minipage` but unlike with `\footnote` the numbering scheme is unaltered.

`ledgroup` Minipages, of course, are not broken across pages. Footnotes in a `ledgroup` environment are typeset at the end of the environment, as with minipages, but the environment includes normal page breaks. The environment makes no change to the `textwidth` so it appears as normal text; it just might be that footnotes appear in the middle of a page, with text above and below.

The `ledgroupsized` environment is similar to `ledgroup` except that you must specify a width for the environment, as with a `minipage`.

`\begin{ledgroupsized} [<pos>] {<width>}`.

The required `<width>` argument is the text width for the environment. The optional `<pos>` argument is for positioning numbered text within the normal `textwidth`. It may be one of the characters:

l (left) numbered text is flush left with respect to the normal `textwidth`. This is the default.

c (center) numbered text is in the center of the `textwidth`.

r (right) numbered text is flush right with respect to the normal `textwidth`.

Note that normal text, footnotes, and so forth are all flush left.

`\begin{ledgroupsized}{\textwidth}` is effectively the same as `\begin{ledgroup}`

10 Cross referencing

The package provides a simple cross-referencing facility that allows you to mark places in the text with labels, and generate page and line number references to those places elsewhere using those labels.

10.1 Basic use

- `\edlabel` First you place a label in the text using the command `\edlabel{<lab>}`. `<lab>` can be almost anything you like, including letters, numbers, punctuation, or a combination—anything but spaces; you might say `\edlabel{toves-3}`, for example.¹⁸
- `\edpageref` Elsewhere in the text, either before or after the `\edlabel`, you can refer to its location via `\edpageref{<lab>}`, or `\edlineref{<lab>}` will produce, respectively, the page, line, sub-line and pstart on which the `\edlabel{<lab>}` command occurred.
- `\edlineref`
- `\sublineref`
- `\pstartref` An `\edlabel` command may appear in the main text, or in the first argument of `\edtext`, but not in the apparatus itself. But `\edpageref`, `\edlineref`, `\sublineref`, `\pstartref` commands can also be used in the apparatus to refer to `\edlabel`s in the text.

The `\edlabel` command works by writing macros to $\text{\LaTeX}.\text{aux}$ file. You will need to process your document through \LaTeX twice in order for the references to be resolved.

You will be warned if you say `\edlabel{foo}` and `foo` has been used as a label before. The `ref` commands will return references to the last place in the file marked with this label. You will also be warned if a reference is made to an undefined label. (This will also happen the first time you process a document after adding a new `\edlabel` command: the auxiliary file will not have been updated yet.)

10.2 Refer to a critical notes

If you want to refer to a word inside an `\edtext{<lemma>}{<app>}` command, the `\edlabel` should be defined inside the first argument, e.g.,

```
The \edtext{creature\edlabel{elephant}} was quite
unafraid}{\Afootnote{Of the mouse, that is.}}
```

If you add the `\edlabel` inside some `\Xfootnote` command, it will refer to that note, and a suffix `n` will be added to the reference. You can redefine this suffix by redefining the command `\ledinnotemark`. Its actual definition is:

```
\newcommand{\ledinnotemark}[1]{\#1\emph{n}}
```

10.3 Cross-referencing which return a number in any case

`\xpageref` Where `#1` stands for the reference.

`\xlineref` However, there are situations in which you will want `reledmac` to return a number without displaying any warning messages about undefined labels or the like: if you want to use the reference in a context where \TeX is looking for a number, such a warning will lead to a complaint that the number is missing. This is the case for references used within the argument to `\linenum`, for example (see 5.2.5 p. 23).

`\xsublineref` For this situation, four variants of the reference commands, with the `x` prefix, are supplied: `\xpageref`, `\xlineref`, `\xsublineref` and `\xpstartref`. They have these limitations:

¹⁸More precisely, you should stick to characters in the \TeX categories of “letter” and “other”.

- They will not tell you if the label is undefined.
- They must be preceded in the file by at least one of the four other cross-reference commands—e.g., a `\edlabel{foo}` command, even if you never refer to that label—since those commands can all do the necessary processing of the `.aux` file, and the `\x...` ones cannot.
- When `hyperref` is loaded, the `hyperref` link will not be added. (Indeed, it is not a limitation, but a feature.)

10.3.1 Cross-referencing in order to define line number of a critical note

`\xxref` The macros `\xxref` and `\edmakelabel` let you manipulate numbers and labels in ways which you may find helpful in tricky situations.

The `\xxref{\langle lab1 \rangle}{\langle lab2 \rangle}` command generates a reference to a sequence of lines, for use in the second argument of `\edtext`. It takes two arguments, both of which are labels: e.g., `\xxref{mouse}{elephant}`. It calls `\linenum` (q.v., 5.2.5 p. 23 above) and sets the beginning page, line and subline numbers to those of the place where `\edlabel{mouse}` was placed, and the ending numbers to those where `\edlabel{elephant}` occurs.

10.4 Not automatic cross-referencing

`\edmakelabel` Sometimes the `\edlabel` command cannot be used to specify exactly the page and line desired—for example, if you want to refer to a page and line number in another volume of your edition. In such cases, you can use the `\edmakelabel{\langle lab \rangle}{\langle numbers \rangle}` macro so that you can ‘roll your own’ label.

For example, if you say ‘`\edmakelabel{elephant}{10|25|0}`’ you will create a new label, and a later call to `\edpageref{elephant}` would print ‘10’ and `\lineref{elephant}` would print ‘25’. The sub-line number here is zero. It is usually best to collect your `\edmakelabel` statements near the top of your document, so that you can see them at a glance.

10.5 Normal L^AT_EX cross-referencing

`\label`
`\ref`
`\pageref` The normal `\label`, `\ref` and `\pageref` macros may be used within numbered text, and operate in the familiar fashion.

10.6 References to lines commented in the apparatus

You may want to make a cross-reference to a passage that is referred to by `\edtext`. `reledmac` provides specific tools for this scenario.

`\applabel` If you use `\applabel{\langle label \rangle}` inside the second argument of a `\edtext`, `reledmac` will add a `\edlabel` at the beginning and end of the marked passage. The label at the beginning of the passage will have the title `\langle label \rangle:start`, while the label at the end will have the title `\langle label \rangle:end`.

If you use `\linenum` (5.2.5 p. 23) to refer to these labels, `reledmac` will use your line settings to refer to the passage.

```
\appref
\apprefwithpage
\setapprefprefixsingle
\setapprefprefixmore
```

You can also use `\appref{<label>}` and `\apprefwithpage{<label>}` to refer to these lines. The first one will print the lines as they are printed in the critical footnotes, while the second will print the lines as they are printed in endnotes.

If you use `\setapprefprefixsingle{<prefix>}`, `<prefix>` will be printed before the line numbers of a `\appref`-reference. If you use `\setapprefprefixmore{<prefix>}`, `<prefix>` will be printed before the line numbers, if you refer to more than one line.

For example, you may use:

```
\setapprefprefixsingle{line~}
\setapprefprefixmore{lines~}
```

Note that if you have not used `\setapprefprefixmore` is empty, argument of `\setapprefprefixsingle` will used in any case.

If you use `\Xtwolines`, `\Xmorethanwolines`, `\Xtwolinesbutnotmore` and/or `\Xtwolinesonlyinsamepage` (6.2.2 p. 30) *without the optional series argument*, the setting will also be available for `\appref`.

The commands `\Xtwolinesappref{<text>}`, `\Xmorethanwolinesappref{<text>}`, `\Xtwolinesbutnotmoreappref` `\Xtwolinesonlyinsamepageappref` can also be used, if you only want to change the reference style of `\appref`.

It is possible to disable this setting for a specific `\appref` command by using `\appref[fulllines]{<label>}`.

If you use one of `\Xendtwolines`, `\Xendmorethanwolines`, `\Xendtwolinesbutnotmore`, `\Xendtwolinesapprefwithpage` `\Xendtwolinesonlyinsamepage` (6.2.2 p. 30) *without the optional series argument*, the `linesbutnotmoreapprefwithpage` setting will also be available for `\apprefwithpage`.

The commands `\Xendtwolinesappref{<text>}`, `\Xendmorethanwolinesappref{<text>}`, `\Xendtwolinesbutnotmoreappref`, `\Xendtwolinesonlyinsamepageappref` can also be used, if you only want to change the reference style of `\apprefwithpage`.

It is possible to disable this setting for a specific `\apprefwithpage` command by using `\apprefwithpage[fulllines]{<label>}`.

11 Side notes

11.1 Basis

The `\marginpar` command does not work in numbered text. Instead the package provides for non-floating sidenotes in either margin.

`\ledinnernote{<text>}` will put `<text>` into the inner margin level with where the command was issued. Similarly, `\ledouternote{<text>}` puts `<text>` in the outer margin.

`\ledleftnote` `\ledrightnote` `\ledsidenote` `\sidenotemargin`

`\ledsidenote{<text>}` will put `<text>` into the margin specified by the current setting of `\sidenotemargin{<location>}`. The permissible value for `<location>` is one out of the list `left`, `right`, `inner`, or `outer`, for example `\sidenotemargin{outer}`. The package's default setting is

```
\sidenotemargin{right}
```

to typeset \ledsidenotes in the right hand margin. This is the opposite to the default margin for line numbers. The style for a \ledsidenote follows that for a \ledleftnote or a \ledrightnote depending on the margin it is put in.

If two note commands for the same side are called in the same line, they will be appended and separated by a comma.

11.2 Setting

11.2.1 Width

\ledlsnotewidth
\ledrsnotewidth

The left sidenote text is put into a box of width \ledlsnotewidth and the right text into a box of width \ledrsnotewidth. These are initially set to the value of \marginparwidth.

11.2.2 Vertical position

\rightnoteupfalse
\leftnoteupfalse

By default, sidenotes are placed to align with the last line of the note to which it refers. If you want them to be placed to align with the first line of the note to which it refers, use \leftnoteupfalse (for left note) and/or \rightnoteupfalse (for right note).

11.2.3 Distance to the main text

\ledlsnotesep
\ledrsnotesep
\ledlsnotefontsetup
\ledrsnotefontsetup

The texts are put a distance \ledlsnotesep (or \ledrsnotesep) into the left (or right) margin. These lengths are initially set to the value of \linenumsep.

These macros specify how the sidenote texts are to be typeset. The initial definitions are:

```
\newcommand*{\ledlsnotefontsetup}{\raggedleft\footnotesize}%
\newcommand*{\ledrsnotefontsetup}{\raggedright\footnotesize}%
```

These can of course be changed to suit.

11.2.4 Separator between notes

\setsidenotesep

If you have two or more sidenotes for the same line, they are separated by a comma. But if you want to change this separator, you can use \setsidenotesep{<sep>}.

12 Indexing

12.1 Basis

\edindex

\LaTeX provides the \index{<item>} command for specifying that <item> and the current page number should be added to the raw index (idx) file. The \edindex{<item>} macro can be used in numbered text to specify that <item> and the current page & linenumber should be added to the raw index file.

Note that the file `.idx` will contain the right reference only after the third run, because of the internal indexing mechanism of `eledmac`. That means you must first run three times (Xe/Lua)TeX, then run `makeindex` and finally run again (Xe/Lua)TeX to get an index with the right page numbers.

If the `imakeidx` or `indextools` package is used then the macro takes an optional argument, which is the name of a raw index file. For example `\edindex[line]{item}` will use `line.idx` as the raw file instead of `\jobname.idx`.

The minimal version of `imakeidx` package to be used is the version 1.3a uploaded on CTAN on 2013/07/11.

Be careful with the order of package loading and index declaration. You must use this order:

1. Load `imakeidx` or `indextools`.
2. Load `reledmac`.
3. Declare the index with the macro `\makeindex` of `imakeidx`/`indextools`.

12.2 Separator between page and line numbers

\pagelinesep

The page & linenumber combination is written as `page\pagelinesep line`, where the default definition is `\newcommand{\pagelinesep}{-}` so that an item on page 3, line 5 will be noted as being at 3-5. You can renew `\pagelinesep` to get a different separator.

`-` is the default separator used by the `MAKEINDEX` program.

Consequently, if you want to use an other `\pagelinesep`, you have to configure your `.ist` index style file. For example if you use `:` as separator¹⁹.

```
page_compositor ":"  
delim_r ":"
```

Read the `MAKEINDEX` program's handbook about the `.ist` file.

12.3 Using xindy

Should you decide to use `xindy` instead of `makeindex` to transform your `.idx` files into `.ind` files, you must use some specific configuration file (`.xdy`) so that `xindy` can understand `eledmac` reference syntax of which the scheme is:
`pagenumber-linenumber`

An example of such a file is provided in the “examples” folder. Read the `xindy` handbook to learn how to use it.²⁰

This file also provides, with an explanation, the settings that are needed to put `reledmac` lines numbers in parenthesis, in order to make a better distinction between line numbers and page ranges.

In any case, you must load `reledmac` with the `xindy` option, in order to generate a `.xdy` file which is specific to your document. This file is needed by the `.xdy` example file

¹⁹For further detail, you can read <http://tex.stackexchange.com/a/32783/7712>.

²⁰Or, for people who read French, read <http://geekographie.maieul.net/174>.

which is in the “examples” folder. Its default name is `reledmac-markup-attr.xdy`, but you can change it by using your own as an argument of the `xindy+hyperref` option.

If you chose to use both `xindy` and the `hyperref` package, you must do three more things:

1. Use `xindy+hyperref` option when loading the `reledmac` package. When you run (Xe/Lua)TeX with this option, a `.xdy` configuration file will be generated with all the settings needed to allow internal hyperlinking in each index entry which is created by `\edindex`.
2. Use `hyperindex=false` option when loading `hyperref`.
3. Uncomment — by removing the semicolons at the beginning of the relevant lines — some lines in the `<code>.xdy</code>` file provided in the “examples” folder in order to restore internal links in the index to be used by the standard `index` command.²¹.

12.4 Advanced setting

`\edindexlab`

The `\edindex` process uses a `\label/\ref` mechanism to get the correct line number. It automatically generates labels of the form `\label{\edindexlab N}`, where `N` is a number, and the default definition of `\edindexlab` is:

```
\newcommand*{\edindexlab}{$&}
```

in the hopes that this will not be used by any other labels (`\edindex`’s labels are like `\label{$&27}`). You can change `\edindexlab` to something else if you need to.

13 Tabular material

TeX’s normal `tabular` and `array` environments cannot be used where line numbering is being done; more precisely, they can be used but with odd results, so don’t use them. However, `reledmac` provides some simple tabulation environments that can be line numbered. The environments can also be used in normal unnumbered text.

`edarrayl` `edarrayc` `edarrayr` `edtabularl` `edtabularc` `edtabularr`

There are six environments; the `edarray*` environments are for math and `edtabular*` for text entries. The final `l`, `c`, or `r` in the environment names indicate that the entries will be flushleft (`l`), centered (`c`) or flushright (`r`). There is no means of specifying different formats for each column, nor for specifying a fixed width for a column. The environments are centered with respect to the surrounding text.

```
\begin{edtabularc}
1 & 2 & 3 \\
a & bb & ccc \\
AAA & BB & C
\end{edtabularc}
```

1	2	3
a	bb	ccc
AAA	BB	C

Entries in the environments are the same as for the normal `array` and `tabular` environments but there must be no ending `\backslash` at the end of the last row. *There must be*

²¹These are the recommended lines to provide the best possible compatibility between `hyperref` and `xindy`, even without using `reledmac`.

the same number of column designators (the &) in each row. There is no equivalent to any line drawing commands (such as `\hline`). However, unlike the normal environments, the `ed...` environments can cross page breaks.

Macros like `\edtext` can be used as part of an entry.

For example:

```
\begin{numbering}
\pstart
\begin{edtabularl}
\textbf{\Large I} & wish I was a little bug\edindex{bug} &
\textbf{\Large I} & eat my peas with honey\edindex{honey} \\
& With whiskers \edtext{round}{\footnote{around}} my tummy &
& I've done it all my life. \\
& I'd climb into a honey\edindex{honey} pot &
& It makes the peas taste funny \\
& And get my tummy gummy.\edindex{gummy} &
& But it keeps them on the knife.
\end{edtabularl}
\pend
\end{numbering}
```

produces the following parallel pair of verses.

1	I wish I was a little bug	I eat my peas with honey
2	With whiskers round my tummy	I've done it all my life.
3	I'd climb into a honey pot	It makes the peas taste funny
4	And get my tummy gummy.	But it keeps them on the knife.

`\edtabcolsep` The distance between the columns is controlled by the length `\edtabcolsep`.
`\spreadmath{<math>}` typesets `{<math>}` but the `{<math>}` has no effect on the calculation of column widths. `\spreadtext{<text>}` is the analogous command for use in `edtabular` environments.
`\begin{edarrayl}`
`1 & 2 & 3 & 4 \\`
`& \spreadmath{F+G+C} & & \\`
`a & bb & ccc & dddd`
`\end{edarrayl}`

1	2	3	4
<i>F + G + C</i>			
<i>a</i>	<i>bb</i>	<i>ccc</i>	<i>ddd</i>

`\edrowfill` The macro `\edrowfill{<start>}{<end>}{<fill>}` fills columns number `<start>` to `<end>` inclusive with `<fill>`. The `<fill>` argument can be any horizontal 'fill'. For example `\hrulefill` or `\upbracefill`.

Note that every row must have the same number of columns, even if some would not appear to be necessary.

The `\edrowfill` macro can be used in both tabular and array environments. The typeset appearance of the following code is shown below.

```
\begin{edtabularr}
1 & 2 & 3 & 4 & 5 \\
& & & fd & h & qwertziohg
```

```

v & wptz & x & y & vb \\
g & nnn & \edrowfill{3}{5}{\upbracefill} & & \\
\edrowfill{1}{3}{\downbracefill} & & & pq & dgh \\
k & & & 1 & co & ghweropjklmnvcxys \\
1 & & & 2 & 3 & \edrowfill{4}{5}{\hrulefill} & \\
\end{tabularr}

```

1	2	3	4	5
Q		fd	h	qwertziohg
v	wptz	x	y	vb
g	nnn			dgh
k		1	co	ghweropjklmnvcxys
1	2	3		

You can also define your own ‘fill’. For example:

```
\newcommand*\upbracketfill{%
  \vrule height 4pt depth Opt\hrulefill\vrule height 4pt depth Opt}
```

is a fill like `\upbracefill` except it has the appearance of a (horizontal) bracket instead of a brace. It can be used like this:

```

\begin{edarrayc}
1 & 2 & 3 & 4 & \\
a & \edrowfill{2}{3}{\upbracketfill} & & d & \\
A & B & C & D & \\
\end{edarrayc}

```

1	2	3	4
a		d	
A	B	C	D

`\edatleft` `\edatright` `\edatleft[<math>]{<symbol>}{<halfheight>}` typesets the math `<symbol>` as `\left{<symbol>` with the optional `<math>` centered before it. The `<symbol>` is twice `<halfheight>` tall. The `\edatright` macro is similar and it typesets `\right{<symbol>}` with `<math>` centered after it.

```

\begin{edarrayc}
& 1 & 2 & 3 & \\
& 4 & 5 & 6 & \\
\edatleft[left =]{\{}{1.5\baselineskip}
& 7 & 8 & 9 & \\
\edatright[= right]{\}}{1.5\baselineskip}
\end{edarrayc}

```

$$left = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix} = right$$

`\edbeforetab` `\edbeforetab{<text>}{<entry>}`, where `<entry>` is an entry in the leftmost column,
`\edaftertab` typesets `<text>` left justified before the `<entry>`. Similarly `\edaftertab{<entry>}{<text>}`,
where `<entry>` is an entry in the rightmost column, typesets `<text>` right justified after
the `<entry>`.

For example:

```
\begin{edarrayl}
    A & 1 & 2 & 3 \\
\edbeforetab{Before}{B} & 1 & 3 & 6 \\
    C & 1 & 4 & \edaftertab{8}{After} \\
    D & 1 & 5 & 0
\end{edarrayl}
```

Before	$A \quad 1 \quad 2 \quad 3$ $B \quad 1 \quad 3 \quad 6$ $C \quad 1 \quad 4 \quad 8$ $D \quad 1 \quad 5 \quad 0$	After
--------	--	-------

`\edvertline` The macro `\edvertline{<height>}` draws a vertical line `<height>` high (contrast this
`\edvertdots` with `\edatright` where the size argument is half the desired height).

```
\begin{edarrayr}
a & b & C & d & \\
v & w & x & y & \\
m & n & o & p & \\
k & & L & cvb & \edvertline{4pc}
\end{edarrayr}
```

a	b	C	d	v w x y m n o p k L cvb

The `\edvertdots` macro is similar to `\edvertline` except that it produces a vertical dotted instead of a solid line.

14 Sectioning commands

14.1 Sectioning commands without line numbers or critical notes

The standard sectioning commands (`\chapter`, `\section` etc.) can be used inside numbered text. In this case, you must call them as an optional argument of `\pstart` (4.2.3

p. 16):

```
\pstart[\section{section}]
Pstart content.
\pend
```

The line which contains them will not be numbered, and you can not add critical notes inside.

14.2 Sectioning commands with line numbering and critical notes

You have to use the following commands:

- `\eledchapter[<text>]{<critical text>}`
- `\eledchapter*`
- `\eledsection[<text>]{<critical text>}`
- `\eledsection*`
- `\eledsubsection[<text>]{<critical text>}`
- `\eledsubsection*`
- `\eledsubsubsection[<text>]{<critical text>}`
- `\eledsubsubsection*`

Which are equivalent to the L^AT_EX commands. Each individual command must be called alone in a `\pstart... \pend`:

```
\pstart
\eledsection*{xxxx\ledsidenote{section}}
\pend
\pstart
\eledsubsection*{xxxx\ledsidenote{sub}}
\pend
\pstart
normal text
\pend
```

At the first run, you will see only the text. It is normal. At the second run, you will see the formating. And consequently, at the third run, you will see the table of contents.

For technical reasons, the page break before `\eledchapter` can not be added automatically. You have to insert it manually via `\beforeeledchapter`, which must be called outside of a numbered section.

14.3 Optimization

`\noeledsec` If you are not going to have any `\eledxxx` commands, then load `reledmac` with `\noeledsec` option. That will suppress the generation of unneeded `.eledsec` file, keep memory and make `reledmac` faster.

15 Quotation environments

The quotation and quote environment can be used so that same definition/note appears both inside and outside a numbered section. The typographical consequences will resemble the outside numbered sections, based on the styles of the `book` class. However, if you use a package that redefines these environments, these redefinitions won't be available inside the numbered section. You must open any quotation environments inside a `\start-\pend` block, not outside. A quotation environment MUST not be opened immediately after a `\pstart` and MUST not be closed immediately before a `\pend`.

In some cases, you do not want these environments to be redefined in numbered sections. You can load the package with the option `noquotation` to prevent this redefinition.

16 Page breaks

16.1 Control page breaking

`reledmac` and `reledpar` break pages automatically. However, you may sometimes want to either force page breaks or prevent them. The packages provide two macros:

- `\ledpb` • `\ledpb` adds a page break.
- `\lednomp` • `\lednomp` prevents a page break, by adding one line to the current page if needed.

These commands have effect only at the second run.

These two commands take effect at the beginning of line in which they are called. For example, if you call `\ledpb` at l. 444, the l. 443 will be at the p. n , and the l. 444 at the p. $n + 1$. However you can change the behavior, and decide they will have effect after the end of the line, adding `\ledpbsetting{after}` at the beginning of your file (better: in your preamble). With the previous example, the l. 444 will be at the p. n and the l. 445 will be at the p. $n + 1$.

If you are using `reledpar` to typeset parallel pages you must use `\lednomp` on both sides in the two corresponding lines. This is especially important when you are using stanzas; otherwise the pages will run out of sync.

16.2 Prevent page break in a long verses

`\lednopbinversetrue` You can also decide to prevent page breaks between two lines of a long verse. To do this, use `nopbinverse` when loading package, or add `\lednopbinversetrue` in the beginning of your file (better: in your preamble).

This feature works only with verse of 2 lines, not more. It works at the third run, or at fourth run with `reledpar`. By default, when a long verse runs normally between two pages, a page break will be placed at the beginning of the verse. However, if you have added `\ledpbsetting{after}`, the page break will be placed at the end of the long verse, and the page containing the long verse will have one extra line.

17 Miscellaneous

`\extensionchars` When the package assembles the name of the auxiliary file for a section, it prefixes `\extensionchars` to the section number. This is initially defined to be empty, but you can add some characters to help distinguish these files if you like; what you use is likely to be system-dependent. If, for example, you said `\renewcommand{\extensionchars}{!}`, then you would get temporary files called `jobname.!1`, `jobname.!2`, etc.

`\ifledfinal` The package can take options. The option ‘final’, which is the default is for final typesetting; this sets `\ifledfinal` to TRUE. The other option, ‘draft’, may be useful during earlier stages and sets `\ifledfinal` to FALSE.

`\showlemma` The lemma within the text is printed via `\showlemma{lemma}`. Normally, or with the ‘final’ option, the definition of `\showlemma` is:

```
\newcommand*{\showlemma}[1]{#1}
```

so it just produces its argument. With the ‘draft’ option it is defined as

```
\newcommand*{\showlemma}[1]{\textit{#1}}
```

so that its argument is typeset in an italic font, which may make it easier to check that all lemmas have been treated.

If you would prefer some other style, you could put something like this in the preamble:

```
\ifledfinal \else
  \renewcommand{\showlemma}[1]{\textbf{#1}}% or simply ...[1]{#1}
\fi
```

17.1 Known and suspected limitations

17.2 ‘No room for a new’

Sometime, especially when using `reledmac` with other packages, you could obtain warning message such ‘no room for a new count’ or ‘no room for a new write’.

The first thing in order to prevent such problem is to use the options to optimize `reledmac`. For example, if you need only two series of notes, use `series={A,B}` option. Read ?? p. ?? in order to know which are there options.

However, if with these options you still have such message, here are some tricks.

‘**no room for a new count**’ is often caused by a conjunction with `biblatex`. Load `reledmac` (and `reledpar`) *before* `biblatex`.

‘**no room for a new write**’ can be caused by with multiple indexes. In this case, use `indextools` of `imakeidx` with the `splitindex` option, in order to obtain only

one `.idx` file. If that does not solve your problem, you can use `morewrites` package. That should solve the problem, but \LaTeX will be slower.

If after reading and applying these advices you have still problem, contact us with a minimal working example.

17.3 Marginal notes

In general, `reledmac`'s system for adding marginal line numbers breaks anything that makes direct use of the \LaTeX insert system, which includes `marginpars`, footnotes and floats.

However, you can use both `\footnote` and the familiar footnote series notes in numbered text. A `\marginpar` in numbered text will throw away its contents and send a warning message to the terminal and log file, but will do no harm.

17.4 Paragraph shape

`\parshape` cannot be used within numbered text, except in a very restricted way.

\ballast \LaTeX is a three-pass system, but even after a document has been processed three times, there are some tricky situations in which the page breaks decided by \TeX never settle down. At each successive run, `reledmac` may oscillate between two different sets of page decisions. To stop this happening, should it arise, Wayne Sullivan suggested the inclusion of the quantity `\ballast`. The amount of `\ballast` will be subtracted from the penalties which apply to the page breaks calculated on the *previous* run through \TeX , thus reinforcing these breaks. So if you find your page breaks oscillating, say
`\setcounter{ballast}{100}`
or some such figure, and with any luck the page breaks will settle down. Luckily, this problem does not crop up at all often.

17.5 Paragraphed footnotes

The restriction on explicit line-breaking in paragraphed footnotes, mentioned in a footnote 17 p. 29, and described in more detail on XII.6.3 p. 147, really is a nuisance if that is something you need to do. There are some possible solutions, described by Michael Downes, but this area remains unsatisfactory.

\footfudgefiddle For paragraphed footnotes \TeX has to estimate the amount of space required. If it underestimates this then the notes may get too long and run off the bottom of the text block. `\footfudgefiddle` can be increased from its default 64 (say to 68) to increase the estimate. You have to use `\renewcommand` for this, like:
`\renewcommand{\footfudgefiddle}{68}`

17.6 Use with other packages

Because of `reledmac`'s complexity it may not play well with other packages. In particular `reledmac` is sensitive to commands in the arguments to the `\edtext` and `*\footnote` macros (this is discussed in more detail in section VI, and in particular the

discussion about `\no@expands` and `\morenoexpands`). You will have to see what works or doesn't work in your particular case.

`\morenoexpands`

You can define the macro `\morenoexpands` to modify macros that you call within `\edtext`. Because of the way `reledmac` numbers the lines the arguments to `\edtext` can be processed more than once and in some cases a macro should only be processed once. One example is the `\colorbox` macro from the `color` package, which you might use like this:

```
... \edtext{\colorbox{mycolor}{lemma}}{\Afootnote{...}\colorbox{...}}
```

If you actually try this²² you will find L^AT_EX whining ‘Missing { inserted’, and then things start to fall apart. The trick in this case is to specify either:

```
\newcommand{\morenoexpands}{\let\colorbox=0}
```

or

```
\makeatletter
\newcommand{\morenoexpands}{\let\colorbox{@secondoftwo}}
\makeatother
```

(`@secondoftwo` is an internal L^AT_EX macro that takes two arguments and throws away the first one.) The first incantation lets `color` show in both the main text and footnotes whereas the second one shows `color` in the main text but kills it in the lemma and footnotes. On the other hand if you use `\textcolor` instead, like

```
... \edtext{\textcolor{mycolor}{lemma}}{\Afootnote{...}\textcolor{...}}
```

there is no need to fiddle with `\morenoexpands` as the color will naturally be displayed in both the text and footnotes. To kill the color in the lemma and footnotes, though, you can do:

```
\makeatletter
\newcommand{\morenoexpands}{\let\textcolor{@secondoftwo}}
\makeatother
```

It took Peter Wilson a little while to discover all this. If you run into this sort of problem you may have to spend some time experimenting before hitting on a solution.

If you want to use the option *bottom* of the `footmisc` package, you must load this package *before* the `reledmac` package.

²²Reported by Dirk-Jan Dekker in the CTT thread ‘Incompatibility of “color” package’ on 2003/08/28.

17.7 Parallel typesetting

Peter Wilson has developed the `ledpar` package as an extension to `ledmac` specifically for parallel typesetting of critical texts. This also cooperates with the `babel` / `polyglossia` packages for typesetting in multiple languages. `reledpar` is the successor of the primitive `ledpar` package.

Peter Wilson also developed the `ledarab` package for handling parallel Arabic text in critical editions. However, this package is not maintained by Maïeul Rouquette. You should use the capabilities of a modern TeX processor, like Xe(La)TeX

I Implementation overview

We present the `reledmac` code in roughly the order in which it is used during a run of `TEX`. The order is *exactly* that in which it is read when you load The `Eledmac` package, because the same file is used to generate this manual and to generate the `LATEX` package file.

Most of what follows consists of macro definitions, but there are some commands that are executed immediately—especially at the start of the code. The documentation generally describes the code from the point of view of what happens when the macros are executed, though. As each macro is introduced, its name is printed in the margin.

After package options, we begin with the commands you use to start and stop line numbering in a section of text (Section II). Next comes the machinery for writing and reading the auxiliary file for each section that helps us count lines, and for creating list macros encoding the information from that file (Section V); this auxiliary file will be read at the start of each section, to create those list macros, and a new version of the file will be started to collect information from the body of the section.

Next are commands for marking sections of the text for footnotes (Section VI), followed by the macros that take each paragraph apart, attach the line numbers and insertions, and send the result to the vertical list (Section VII). The footnote commands (Section XII) and output routine (Section ??) finish the main part of the processing; cross-referencing (Section XXIII) and endnotes (Section XIX) complete the story.

In what follows, macros with an @ in their name are more internal to the workings of `reledmac` than those made up just of ordinary letters, just as in `PLAIN TEX` (see *The TeXbook*, p. 344). You are meant to be able to make free with ordinary macros, but the '@' ones should be treated with more respect, and changed only if you are pretty sure of what you are doing.

II Preliminaries

II.1 Links with original `edmac`

Generally, these are the modifications to the original `edmac` code:

- Replace as many `\def`'s by `\newcommand`'s as possible to avoid overwriting `LATEX` macros.
- Replace user-level `TEX` counts by `LATEX` counters.
- Use the `LATEX` font handling mechanisms.
- Use `LATEX` messaging and file facilities.

II.2 Package declaration

Announce the name and version of the package, which is targetted for `LaTeX2e`.

```

1  %<*code>
2  \NeedsTeXFormat{LaTeX2e}
3  \ProvidesPackage{reledmac}[2015/08/26 v2.1.2 typeset critical edition]%
4 %

```

II.3 Package options

```

\ifledfinal  Use this to remember which option is used, set and execute the options with final as the
\ifnocritical@ default. We use xkeyval in order to manage options with argument.
\if@noeled@sec
  \ifnoend@5 \RequirePackage{xkeyval}
  \ifnoend@6 %
\ifnofamiliar@
\ifnoledgroup@ The parledgroup option is for reledpar. However, it has consequence on reledmac
\ifparapparatus@ internal command. So we need to define the boolean now.
\ifnoquotation@7 \newif\ifparledgroup
\iflednopbinverse8 %
\ifparledgroup
\ifwidthliketwocolumns And now, the options of reledmac.

61   \xindyhyperref@true%
62 }%
63
64 \newif\ifeledmaccompat@
65 \DeclareOptionX{eledmac-compat}{%
66   \eledmaccompat@true%
67 }%
68 %

```

We use the starred form of `\ProcessOptionsX` which executes options in the order listed in the source file: class options, then listed package options, so a package option can override a class option with the same name. This was suggested by Dan Luecking in the ctt thread *Class/package option processing*, on 27 February 2004.

```

69 \ProcessOptionsX*\relax
70 %
71 %

```

II.4 Loading packages

Loading package `xargs` to declare commands with optional arguments. `Etoolbox` is also used to make code clearer - for example, in dynamic command names (which can replace `\csname` etc.). Use `suffix` to declare commands with a starred version, `xstring` to work with strings, `ifluatex` and `ifxetex` to test if `LuaTeX` or `XeTeX` is running, and `ragged2e` to manage ragged for paragraphed notes.

```

72 \RequirePackage{xargs}
73 \RequirePackage{etoolbox}

```

```

74 \RequirePackage{etex}
75 \reserveinserts{32}
76 \RequirePackage{suffix}
77 \RequirePackage{xstring}
78 \RequirePackage{ifluatex}
79 \RequirePackage{ragged2e}
80 \RequirePackage{ragged2e}
81 \RequirePackage{ifxetex}%
82 %

```

II.5 Boolean flags

`\ifl@dmemoir` Define a flag for if the `memoir` class has been used.

```

83 \newif\ifl@dmemoir
84 \@ifclassloaded{memoir}{\l@dmemoirtrue}{\l@dmemoirfalse}
85 %
86 %

```

`\ifl@imakeidx` Define a flag for if the `imakeidx` package has been used.

```

87 \newif\ifl@imakeidx
88 \@ifpackageloaded{imakeidx}{\l@imakeidxtrue}{%False is the default value
89 %

```

`\ifl@indextools` Define a flag for if the `indextools` package has been used.

```

90 \newif\ifl@indextools%
91 \@ifpackageloaded{indextools}{%
92   \l@indextoolstrue%
93   \l@imakeidxtrue%
94   \let\imki@wrindexentry\indtl@wrindexentry%
95 }{%
96 %

```

False is the default value. We consider `indextools` as a variant of `imakeidx`. That is why we set `\ifl@imakeidx` to true. We also let `\imki@wrindexentry` to `\indtl@wrindexentry`.

`\if@RTL` The `\if@RTL` is defined by the `bidi` package, which is sometimes loaded by *polyglossia*. But we define it as well if the `bidi` package is not loaded.

```

97 \ifdef{\if@RTL}{\newif\if@RTL}
98 %

```

II.6 Messages

All the messages are grouped here as macros. This saves \TeX 's memory when the same message is repeated and also lets them be edited easily.

`\reledmac@warning` Write a warning message.

```
99 \newcommand{\reledmac@warning}[1]{\PackageWarning{reledmac}{#1}}
100 %
```

`\reledmac@error` Write an error message.

```
101 \newcommand{\reledmac@error}[2]{\PackageError{reledmac}{#1}{#2}}
102 %
```

```
\led@err@NumberingStarted03 \newcommand*{\led@err@NumberingStarted}{%

II.7 Gobbling

Here, we define some commands which gobble their arguments.

```
\@gobblethree67 \providecommand*\{@gobblethree}[3]{}
\@gobblefour68 \providecommand*\{@gobblefour}[4]{}
\@gobblefive69 \providecommand*\{@gobblefive}[5]{}
270 %
```

II.8 Miscellaneous commands

`\showlemma` `\showlemma{<lemma>}` typesets the lemma text in the body. It depends on the option.

```
271 \ifledfinal
272   \newcommand*\{@showlemma}[1]{#1}
273 \else
274   \newcommand*\{@showlemma}[1]{\underline{#1}}
275 \fi
276
277 %
```

`\linenumberlist` The code for the `\linenumberlist` mechanism was given to Peter Wilson by Wayne Sullivan on 2004/02/11.
Initialize it as `\empty`.

```
278 \let\linenumberlist=\empty
279
280 %
```

`\@l@dtmpcnta` In imitation of \LaTeX , we create a couple of scratch counters.
`\@l@dtmpcntb` \LaTeX already defines `\@tempcnta` and `\@tempcntb` but Peter Wilson found in the past that it can be dangerous to use these (for example one of the AMS packages did something nasty to the `ccaption` package's use of one of these).

```
281 \newcount\@l@dtmpcnta \newcount\@l@dtmpcntb
282 %
```

II.9 Prepare reledpar

`\ifnumberingR` In preparation for the `reledpar` package, these are related to the ‘right’ text of parallel texts (when `\ifl@dpairing` is TRUE). They are explained in the `eledpar` manual.

```
\ifl@dpairing
\ifl@dpaging
\l@dpagingtrue
283 \newif\ifl@dpairing
\l@dpagingfalse
284 \newif\ifl@dpaging%
\ifl@dprintingpages
285 \newif\ifl@dprintingpages%
\l@dprintingpagestrue
286 \newif\ifl@dprintingcolumns%
\l@dprintingpagesfalse
287 \newif\ifpst@rtedL
\ifl@dprintingcolumns
\l@dprintingcolumnstrue
\l@dprintingcolumnsfalse
\l@dpairingtrue
\l@dpairingfalse
288 \ifpst@rtedL
\pst@rtedLtrue
\pst@rtedLfalse
\l@dnumpstartsL
\ifledRcol
```

```
288 \newcount\l@dnumpstartsL
289 %
```

\ifledRcol is set to true in the Rightside environnement. It must be not confused with \ifledRcol@ which is set to true when a right line is processed, in \Pages or \Columns.

```
290 \newif\ifledRcol
291 \newif\ifledRcol@
292 %
```

The \ifnumberingR flag is set to true if we're within a right text numbered section.

```
293 \newif\ifnumberingR
294 %
```

III Sectioning commands

\section@num You use \beginnumbering and \endnumbering to begin and end a line-numbered section of the text; the pair of commands may be used as many times as you like within one document to start and end multiple, separately line-numbered sections. L^TE_X will maintain and display a ‘section number’ as a count named \section@num that counts how many \beginnumbering and \resumenumbers commands have appeared; it need not be related to the logical divisions of your text.

\extensionchars Each section will read and write an associated ‘line-list file’, containing information used to do the numbering; the file will be called *<jobname>.nn*, where nn is the section number. However, you may direct that an extra string be added before the nn in that filename, in order to distinguish these temporary files from others: that string is called \extensionchars. Initially it’s empty, since different operating systems have greatly varying ideas about what characters are permitted in file names. So \renewcommand{\extensionchars}{-} gives temporary files called *jobname.-1*, *jobname.-2*, etc.

```
295 \newcount\section@num
296 \section@num=0
297 \let\extensionchars=\empty
298 %
```

\ifnumbering The \ifnumbering flag is set to true if we are within a numbered section (that is, between \beginnumbering and \endnumbering). You can use \ifnumbering in your own code to check whether you are in a numbered section, but do not change the flag’s value.

```
299 \newif\ifnumbering
300 %
```

\beginnumbering \beginnumbering begins a section of numbered text. When it is executed we increment the section number, initialize our counters, send a message to your terminal, and call macros to start the lineation machinery and endnote files.

The initializations here are trickier than they look. \line@list@stuff will use all of the counters that are zeroed here when it assembles the line-list and other lists of information about the lineation. But it will do all of this locally and within a group, and when it is done the lists will remain but the counters will return to zero. Those same counters will then be used as we process the text of this section, but the assignments will be made globally. These initializations actually apply to both uses, though in all other respects there should be no direct interaction between the use of these counters and variables in the two processing steps. For parallel processing :

- zero \l@dnumpstartsL – the number of chunks to be processed.
- set \ifpst@rtedL to FALSE.

```

301 \newcommand*{\beginnumbering}{%

IV List macros

We will make heavy use of lists of information, which will be built up and taken apart by the following macros; they are adapted from *The TeXbook*, pp. 378–379, which discusses their use in more detail.

These macros consume a large amount of the run-time of this code. We intend to replace them in a future version, and in anticipation of doing so have defined their interface in such a way that it is not sensitive to details of the underlying code.

The historical list tools of `ledmac` are kept, because in many cases there are more useful than `etoolbox`'s lists. They allow to get and delete the first element of a list in one operation. They also expands the items add to the list.

However, `etoolbox`'s lists are more useful to loop on them. Consequently, depending of what we need, we use one or either.

It could be nice to unify them to the `LATEX3` list, however such migration would take quite time with some risk of error, for a gain which will be minor.

\list@create The `\list@create` macro creates a new list. This macro does not do anything beyond initializing an empty list macro.

```

412 \newcommand*{\list@create}[1]{%
413   \global\let#1=\empty%
414 }%
415 %

```

\list@clear The `\list@clear` macro just initializes a list to the empty list; it is no different from `\list@create` in its effect, but it is in its semantic.

```

416 \newcommand*{\list@clear}[1]{%
417   \global\let#1=\empty%
418 }
419 %

```

\xright@appenditem `\xright@appenditem` expands an item and appends it to the right end of a list macro.

\led@toksa We want the expansion because we will often be using this to store the current value of a counter. `\xright@appenditem` creates global control sequences, like `\xdef`, and uses two temporary token-list registers, `\@toksa` and `\@toksb`.

```

420 \newtoks\led@toksa \newtoks\led@toksb
421 \global\led@toksa={\\}
422 \long\def\xright@appenditem#1\to#2{%
423   \global\led@toksb=\expandafter{#2}%

```

```

424     \xdef#2{\the\led@toksb\the\led@toksa\expandafter{#1}}%
425     \global\led@toksb={}
426 %

```

\xleft@appenditem `\xleft@appenditem` expands an item and appends it to the left end of a list macro; it is otherwise identical to `\xright@appenditem`.

```

427 \long\def\xleft@appenditem#1\to#2{%
428   \global\led@toksb=\expandafter{#2}%
429   \xdef#2{\the\led@toksa\expandafter{#1}\the\led@toksb}%
430   \global\led@toksb={}
431 %

```

\gl@p The `\gl@p` macro removes the leftmost item from a list and places it in a control sequence. You say `\gl@p\l\to\z` (where `\l` is the list macro, and `\z` receives the left item). `\l` is assumed nonempty:use `\ifx\l\empty` to test for an empty `\l`. The control sequences created by `\gl@p` are all global.

```

432 \def\gl@p#1\to#2{\expandafter\gl@poff#1\gl@poff#1#2}
433 \long\def\gl@poff\\#1#2\gl@poff#3#4{\gdef#4{#1}\gdef#3{#2}}
434 %
435 %

```

V Line counting

V.1 Choosing the system of lineation

Line number can be reset at each section (default) ; at each page ; at each pstart. Here we define internal codes for these systems and the macros.

\ifbypstart@ The `\ifbypage@` and `\ifbypstart@` flag specifie the current lineation system:
`\bypstart@true` • line-of-page: `bypstart@ = false` and `bypage@ = true`.
`\bypstart@false` • line-of-pstart: `bypstart@ = true` and `bypage@ = false`.
`\bypage@true` `reledmac` will use the line-of-section system unless instructed otherwise.
`\bypage@false`

```

436 \newif\ifbypage@
437 \newif\ifbypstart@
438 %

```

The `\ifbypage@R` and `\ifbypstart@R` flag specifie the current lineation for right side in case of using `reledpar`. They are now defined because they are used in some specific code. `reledpar` will use the line-of-section system unless instructed otherwise.

```

\ifbypage@R39 \newif\ifbypage@R
\ifbypstart@R40 \newif\ifbypstart@R
441 %

```

`\lineation` `\lineation{<word>}` is the macro you use to select the lineation system. Its argument is a string: either page, section or pstart.

```
442 \newcommand*{\lineation}[1]{{%
443 }%
```

We can't change the lineation system inside numbering section.

```
444 \ifnumbering
445   \led@err@LineationInNumbered
446 \else
447 }%
```

If the argument is page.

```
448 \def\@tempa{#1}\def\@tempb{page}%

V.3 Line number initialization and increment

\c@firstlinenum

\c@linenumincrement

The following counters tell reledmac which lines should be printed with line numbers. `firstlinenum` is the number of the first line in each section that gets a number; `linenumincrement` is the difference between successive numbered lines. The initial values of these counters produce labels on lines 5, 10, 15, etc. `linenumincrement` must be at least 1.

```

518 \newcounter{firstlinenum}
519   \setcounter{firstlinenum}{5}
520 \newcounter{linenumincrement}
521   \setcounter{linenumincrement}{5}
522 %

```

\c@firstsublinenum
\c@sublinenumincrement

The following parameters are just like `firstlinenum` and `linenumincrement`, but for sub-line numbers. `sublinenumincrement` must be at least 1.

```

523 \newcounter{firstsublinenum}
524   \setcounter{firstsublinenum}{5}
525 \newcounter{sublinenumincrement}
526   \setcounter{sublinenumincrement}{5}
527 %
528 %

```

\firstlinenum

\linenumincrement

\firstsublinenum

\sublinenumincrement

These macros can be used to set the corresponding counters.

```

555     \setcounter{sublinenumincrement}{#1}%
556     \fi%
557 }
558 %
559 %

```

V.4 Line number locking

`\lockdisp` When line locking is being used, the `\lockdisp{<word>}` macro specifies whether a line number—if one is due to appear—should be printed on the first printed line or on the last, or by all of them. Its argument is a word, either `first`, `last`, or `all`. Initially, it is set to `first`.

`\lock@disp` encodes the selection: 0 for `first`, 1 for `last`, 2 for `all`.

```

560 \newcount\lock@disp
561 \newcommand{\lockdisp}[1]{{%
562   \l@dge@lock@disp{#1}%
563   \ifnum\l@dge@tempcntb>\m@ne
564     \global\lock@disp=\l@dge@tempcntb
565   \else
566     \led@warn@BadLockdisp
567   \fi}%
568 \newcommand*{\l@dge@lock@disp}[1]{%
569   \def\@tempa{#1}\def\@tempb{first}%

605   \let\sublinenumr@p\sublinenumrep
606 %
607 %

```

V.6 Line number printing

\leftlinenum and \rightlinenum are the macros that are called to print marginal line numbers on a page, for left- and right-hand margins respectively. They are made easy to access and change, since you may want to change the styling in some way. These standard versions illustrate the general sort of thing that will be needed; they are based on the \leftheadline macro in *The TeXbook*, p. 416.

Whatever these macros output gets printed in a box that will be put into the appropriate margin without any space between it and the line of text. You will generally want a kern between a line number and the text, and \linenumsep is provided as a standard way of storing its size. Line numbers are usually printed in a smaller font, and \numlabfont is provided as a standard name for that font. When called, these macros will be executed within a group, so font changes and the like will remain local.

\ledlinenum typesets the line (and subline) number.

The original `\numlabfont` specification is equivalent to the L^AT_EX `\scriptsize` for a 10pt document.

```

608 \newlength{\linenumsep}
609   \setlength{\linenumsep}{1pc}
610 \newcommand*{\numlabfont}{\normalfont\scriptsize}
611 \newcommand*{\ledlinenum}{%
612   \bgroup%
613   \ifluatex%
614     \luatextextdir TLT%
615   \fi%
616   \numlabfont\linenumrep{\line@num}%
617   \ifsblines@
618     \ifnum\sbline@num>0\relax
619       \unskip\fullstop\sblinenumrep{\sbline@num}%
620     \fi
621   \fi%
622   \egroup%
623 }%
624
625 \newcommand*{\leftlinenum}{%
626   \ledlinenum
627   \kern\linenumsep}
628 \newcommand*{\rightlinenum}{%
629   \kern\linenumsep
630   \ledlinenum}
631 %
632 %

```

V.7 Line number counters and lists

Footnote references using line numbers rather than symbols can't be generated in one pass, because we do not know the line numbers till we ship out the pages. It would be possible if footnotes were never keyed to more than one line; but some footnotes gloss passages that may run for several lines, and they must be tied to the first line of the passage glossed. And even one-line passages require two passes if we want line-per-page numbering rather than line-per-section numbering.

So we run L^AT_EX over the text several times, and each time save information about page and line numbers in a 'line-list file' to be used during the next pass. At the start of each section—whenever `\begin{numbering}` is executed—the line-list file for that section is read, and the information from it is encoded into a few list macros.

We need first to define the different line numbers that are involved in these macros, and the associated counters.

`\line@num` The count `\line@num` stores the line number that is used in marginal line numbering and in notes: counting either by section, page or pstart, depending on your choice for this section. This may be qualified by `\sbline@num`.

```

633 \newcount\line@num

```

634 %

`\subline@num` The count `\subline@num` stores a sub-line number that qualifies `\line@num`. For example, line 10 might have sub-line numbers 1, 2 and 3, which might be printed as lines 10.1, 10.2, 10.3.

```
635 \newcount\subline@num
636 %
```

`\ifsblines@` We maintain an associated flag, `\ifsblines@`, to tell us whether we're within a sub-line range or not.

`\sublines@true` You may wonder why we do not just use the value of `\subline@num` to determine this—treating anything greater than 0 as an indication that sub-lineation is on. We need a separate flag because sub-lineation can be used together with line-number locking in odd ways: several pieces of a logical line might be interrupted by pieces of sub-lineated text, and those sub-line numbers should not return to zero until the next change in the major line number. This is common in the typesetting of English Renaissance verse drama, in which stage directions are given sub-line numbers: a single line of verse may be interrupted by several stage directions.

```
637 \newif\ifsblines@
638 %
```

`\absline@num` The count `\absline@num` stores the absolute number of lines since the start of the section: that is, the number we have actually printed, no matter what numbers we attached to them. This value is never printed on an output page, though `\line@num` will often be equal to it. It is used internally to keep track of where notes are to appear and where new pages start: using this value rather than `\line@num` is a lot simpler, because it does not depend on the lineation system in use.

```
639 \newcount\absline@num
640 %
```

We will call `\absline@num` numbers “absolute” numbers, and `\line@num` and `\subline@num` numbers “visible” numbers.

V.8 Line number locking counter

`\@clock` The counts `\@clock` and `\sub@clock` tell us the state of line-number and sub-line-number locking. 0 means we are not within a locked set of lines; 1 means we are at the first line in the set; 2, at some intermediate line; and 3, at the last line.

```
641 \newcount\@clock
642 \newcount\sub@clock
643 %
```

V.9 Line number associated to lemma

```
\line@list
\insertlines@list
\actionlines@list
  \actions@list
```

Now we can define the list macros that will be created from the line-list file. We will maintain the following lists:

- `\line@list`: the page and line numbers for every lemma marked by `\edtext`. There are seven pieces of information, separated by vertical bars:

1. the starting page,
2. line, and
3. sub-line numbers, followed by the
4. ending page,
5. line, and
6. sub-line numbers, and then the
7. font specifier for the lemma.

These line numbers are all visible numbers. The font specifier is a set of four codes for font encoding, family, series, and shape, separated by / characters. Thus a lemma that started on page 23, line 35 and went on until page 24, line 3 (with no sub-line numbering), and was typeset in a normal roman font would have a line list entry like this:

`23|35|0|24|3|0|0T1/cmr/m/n.`

There is one item in this list for every lemma marked by `\edtext`, even if there are several notes to that lemma, or no notes at all. `\edtext` reads the data in this list, making it available for use in the text of notes.

- `\insertlines@list`: the line numbers of lines that have footnotes or other insertions. These are the absolute numbers where the corresponding lemmas begin. This list contains one entry for every footnote in the section; one lemma may contribute no footnotes or many footnotes. This list is used by `\add@inserts` within `\do@line`, to tell it where to insert notes.
- `\actionlines@list`: a list of absolute line numbers at which we are to perform special actions; these actions are specified by the `\actions@list` list defined below.
- `\actions@list`: action codes corresponding to the line numbers in `\actionlines@list`. These codes tell `reledmac` what action it is supposed to take at each of these lines. One action, the page-start action, is generated behind the scenes by `reledmac` itself; the others, for specifying sub-lineation, line-number locking, and line-number alteration, are generated only by explicit commands in your input file. The page-start and line-number-alteration actions require arguments, to specify the new values for the page or line numbers; instead of storing those arguments in another list, we have chosen the action-code values so that they can encode both the action and the argument in these cases. Action codes greater than -1000 are page-start actions, and the code value is the page number; action codes less than -5000 specify line numbers, and the code value is a transformed version of the line number; action codes between these two values specify other actions which require no argument.

Here is the full list of action codes and their meanings:

Any number greater than -1000 is a page-start action: the line number associated with it is the first line on a page, and the action number is the page number. (The cutoff of -1000 is chosen because negative page-number values are used by some macro packages; we assume that page-number values less than -1000 are not common.) Page-start action codes are added to the list by the `\page@action` macro, which is (indirectly) triggered by the workings of the `\page@start` macro; that macro should always be called in the output routine, just before the page contents are assembled. `Eledmac` calls it in `\pagecontents`.

The action code -1001 specifies the start of sub-lineation: meaning that, starting with the next line, we should be advancing `\subline@num` at each start-of-line command, rather than `\line@num`.

The action code -1002 specifies the end of sub-lineation. At the next start-of-line, we should clear the sub-line counter and start advancing the line number. The action codes for starting and ending sub-lineation are added to the list by the `\sub@action` macro, as called to implement the `\startsub` and `\endsub` macros.

The action code -1003 specifies the start of line number locking. After the number for the current line is computed, it will remain at that value through the next line that has an action code to end locking.

The action code -1004 specifies the end of line number locking.

The action code -1005 specifies the start of sub-line number locking. After the number for the current sub-line is computed, it will remain at that value through the next sub-line that has an action code to end locking.

The action code -1006 specifies the end of sub-line number locking.

The four action codes for line and sub-line number locking are added to the list by the `\do@lockon` and `\do@lockoff` macros, as called to implement the `\startlock` and `\endlock` macros.

An action code of -5000 or less sets the current visible line number (either the line number or the sub-line number, whichever is currently being advanced) to a specific positive value. The value of the code is $-(5000 + n)$, where n is the value (always ≥ 0) assigned to the current line number. Action codes of this type are added to the list by the `\set@line@action` macro, as called to implement the `\advanceline` and `\setline` macros: this action only occurs when the user has specified some change to the line numbers using those macros. Normally `reledmac` computes the visible line numbers from the absolute line numbers with reference to the other action codes and the settings they invoke; it does not require an entry in the action-code list for every line.

Here are the commands to create these lists:

```

644 \list@create{\line@list}
645 \list@create{\insertlines@list}
646 \list@create{\actionlines@list}
```

```

647 \list@create{\actions@list}
648 %
649 %

```

\page@num \endpage@num \endline@num We will need some counts while we read the line-list, for the page number and the ending page, line, and sub-line numbers. Some of these will be used again later on, when we are acting on the data in our list macros.

\endsubline@num

```

650 \newcount\page@num
651 \newcount\endpage@num
652 \newcount\endline@num
653 \newcount\endsubline@num
654 %

```

\ifnoteschanged@ If the number of the footnotes in a section is different from what it was during the last run, or if this is the very first time you've run L^AT_EX on this file, the information from the line-list used to place the notes will be wrong, and some notes will probably be misplaced. When this happens, we prefer to give a single error message for the whole section rather than messages at every point where we notice the problem, because we do not really know where in the section notes were added or removed, and the solution in any case is simply to run L^AT_EX two more times; there is no fix needed to the document. The \ifnoteschanged@ flag is set if such a change in the number of notes is discovered at any point.

```

655 \newif\ifnoteschanged@
656 %

```

\resetprevline@ Inside the apparatus, at each note, the line number is stored in a macro called \prevlineX, where X is the letter of the current series. This macro is called when using \Xnumberonlyfirstinline. This macro must be reset at the same time as the line number. The \resetprevline@ does this resetting for every series.

```

\resetprevline@57 \newcommand*{\resetprevline@}{%
658   \def\do##1{\global\csundef{prevline##1}}%
659   \dolistloop{\@series}%
660 }
661 %

```

\resetprevpage@num Inside the apparatus, at each note, the page number is stored in a macro called \prevpageX@num, where X is the letter of the current series. This macro is called when using \Xparafootsep or \parafootsepX. This macro must be reset at the beginning of each numbered section. The \resetprevpage@ command resets this macro for every series.

```

\resetprevpage@62 \newcommand*{\resetprevpage@num}{%
663   \def\do##1{\ifcsdef{prevpage##1@num}{\global\csname prevpage##1@num\%
664     endcsname=0}{}}%

```

```

664     \dolistloop{\@series}%
665 }
666 %

```

V.10 Reading the line-list file

`\read@linelist` `\read@linelist{<file>}` is the control sequence that is called by `\beginnumbering` (via `\line@list@stuff`) to open and process a line-list file; its argument is the name of the file. . First, it clear all previous line's list.

```

667 \newread\@inputcheck
668 \newcommand*\read@linelist}[1]{%
669   \ifledRcol%
670     \list@clearing@regR%
671   \else%
672     \list@clearing@reg%
673   \fi%
674 %

```

When using `reledpar`, make sure that the `\maxlinesinpar@list` is empty (otherwise things will be thrown out of kilter if there is any old stuff still hanging in there).

```

675 \list@clear{\maxlinesinpar@list}
676 %

```

Now get the file and interpret it. When the file is there we start a new group and make some special definitions we will need to process it. It is a sequence of TeX commands, but they require a few special settings. We make [and] become grouping characters: they are used that way in the line-list file, because we need to write them out one at a time rather than in balanced pairs, and it is easier to just use something other than real braces. @ must become a letter, since this is run in the ordinary L^AT_EX context. We ignore carriage returns, since if we are in horizontal mode they can get interpreted as spaces to be printed.

Our line, page, and line-locking counters were already zeroed by `\line@list@stuff` if this is being called from within `\beginnumbering`; sub-lineation will be turned off as well in that case. On the other hand, if this is being called from `\resumenumbering`, those things should still have the values they had when `\pausenumbering` was executed.

If the file is not there, we print an informative message.

Now, after these preliminaries, we start interpreting the file.

```

677 \get@linelistfile{#1}%
678 \endgroup
679 %

```

When the reading is done, we are all through with the line-list file. All the information we needed from it will now be encoded in our list macros.

Finally, we initialize the `\next@actionline` and `\next@action` macros, which specify where and what the next action to be taken is.

```

680   \ifledRcol
681     \global\page@numR=\m@ne
682     \ifx\actionlines@listR\empty
683       \gdef\next@actionlineR{1000000}%
684     \else
685       \gl@p\actionlines@listR\to\next@actionlineR
686       \gl@p\actions@listR\to\next@actionR
687     \fi
688   \else
689     \global\page@num=\m@ne
690     \ifx\actionlines@list\empty
691       \gdef\next@actionline{1000000}%
692     \else
693       \gl@p\actionlines@list\to\next@actionline
694       \gl@p\actions@list\to\next@action
695     \fi
696   \fi
697 }
698 %

```

`\list@clearing@reg` Clears the lists for `\read@linelist`

```

699 \newcommand*{\list@clearing@reg}{%
700   \list@clear{\line@list}%
701   \list@clear{\insertlines@list}%
702   \list@clear{\actionlines@list}%

```

This version of `\read@linelist` creates list macros containing data for the entire section, so they could get rather large. It would be no more difficult to read the line-list

file incrementally rather than all at once: we could read, at the start of each paragraph, only the commands relating to that paragraph. But this would require that we have two line-lists open at once, one for reading, one for writing, and on systems without version numbers we would have to do some file renaming outside of L^AT_EX for that to work. We have retained this slower approach to avoid that sort of hacking about, but have provided the `\pausenumbering` and `\resumenumbering` macros to help you if you run into macro memory limitations (see 4.2.7 p. 17 above).

V.11 Commands within the line-list file

This section defines the commands that can appear within a line-list file. They all have very short names because we are likely to be writing very large numbers of them out. One macro, `\@nl`, is especially short, since it will be written to the line-list file once for every line of text in a numbered section. (Another of these commands, `\@lab`, will be introduced in a later section, among the cross-referencing commands it is associated with.)

When these commands modify the various page and line counters, they deliberately do not say `\global`. This is because we want them to affect only the counter values within the current group when nested calls of `\@ref` occur. (The code assumes throughout that the value of `\globaldefs` is zero.)

The macros with `action` in their names contain all the code that modifies the action-code list: again, this is so that they can be turned off easily for nested calls of `\@ref`.

- `\line@list@version` The `\line@list@version` check if the line-list file does not refers to the older commands of `reledmac`. In this case, we stop reading the line-list file. Consequently, `\line@list@version` must be the first line of a line-number file.

```

```

- `\@nl` `\@nl` does everything related to the start of a new line of numbered text.
`\@nl@reg` In order to get the `\setlinenum` to work Peter Wilson had to slip in some new code at the start of the macro, to get the timing of the actions correct. The problem was that his original naive implementation of `\setlinenum` had a unfortunate tendency to change the number of the last line of the *preceding* paragraph. The new code is sort of based on the page number handling and `\setline`. It seems that a lot of fiddling with the line number internals is required.

In November 2004 in order to accurately determine page numbers Peter Wilson added these to the macro. It is now:

```
\@nl{\langle page counter number \rangle}{\langle printed page number \rangle}
```

We do not (yet) use the printed number (i.e., the `\thepage`) but it may come in handy later. The macro `\fix@page` checks if a new page has started.

Exactly what `\@nl` does depends on whether right text is being processed. That's why many code is defined in `\@nl@reg` or `\nl@regR`.

```

732   \newcommand*{\@nl}[2]{%
733     \fix@page{#1}%

`\lock@on` `\lock@on` adds an entry to the action-code list to turn line number locking on. The `\do@lockon` current setting of the sub-lineation flag tells us whether this applies to line numbers or `\do@lockonL` sub-line numbers.

Adding commands to the action list is slow, and it is very often the case that a lock-on command is immediately followed by a lock-off command in the line-list file, and therefore really does nothing. We use a look-ahead scheme here to detect such pairs, and add nothing to the line-list in those cases.

\@ref \@ref marks the start of a passage, for creation of a footnote reference. It takes two `\insert@count` arguments:

- #1, the number of entries to add to `\insertlines@list` for this reference. This value, here and within `\edtext`, which computes it and writes it to the line-list file, will be stored in the count `\insert@count`.

```

1055 \newcount\insert@count
1056 %

```

- #2, a sequence of other line-list-file commands, executed to determine the ending line-number. (This may also include other `\@ref` commands, corresponding to uses of `\edtext` within the first argument of another instance of `\edtext`.)

\dummy@ref When nesting of `\@ref` commands does occur, it is necessary to temporarily redefine `\@ref` within `\@ref`, so that we are only doing one of these at a time.

```

1057 \newcommand*\{\dummy@ref}[2]{#2}

V.12 Writing to the line-list file

We have now defined all the counters, lists, and commands involved in reading the line-list file at the start of a section. Now we will cover the commands that `reledmac` uses within the text of a section to write commands out to the line-list.

`\linenum@out` The file will be opened on output stream `\linenum@out`.

```

1115 \newwrite\linenum@out
1116 %

```

`\iffirst@linenum@out@first@linenum@out@true` Once any file is opened on this stream, we keep it open forever, or else switch to another file that we keep open. The reason is that we want the output routine to write the page number for every page to this file; otherwise we would have to write it at the start of every line. But it is not very easy for the output routine to tell whether an output stream is open or not. There is no way to test the status of a particular output stream directly, and the asynchronous nature of output routines makes the status hard to determine by other means.

We can manage pretty well by means of the `\iffirst@linenum@out@` flag; its inelegant name suggests the nature of the problem that made its creation necessary. It is set to be true before any `\linenum@out` file is opened. When such a file is opened for the first time, it is done using `\immediate`, so that it will at once be safe for the output routine to write to it; we then set this flag to false.

```

1117 \newif\iffirst@linenum@out@
1118   \first@linenum@out@true
1119 %

```

`\this@line@list@version` The commands allowed in the line-list file and their arguments can change between two version of `reledmac`. The `\this@line@list@version` command is upgraded when it happens. It is written in the file list. If we process a line-list file which used a older version, that means the commands used inside are deprecated, and we can't use them.

```

1120 \newcommand{\this@line@list@version}{2}%
1121 %

```

\line@list@stuff The `\line@list@stuff{<file>}` macro, which is called by `\beginnumbering`, performs all the line-list operations needed at the start of a section. Its argument is the name of the line-list file.

```
1122 \newcommand*\line@list@stuff}[1]{%
1123 %
```

First, use the commands of the previous section to interpret the line-list file from the last run.

```
1124 \read@linelist{#1}%
1125 %
```

Now close the current output line-list file, if any, and open a new one. The first time we open a line-list file for output, we do it using `\immediate`, and clear the `\iffirst@linenum@out@` flag.

```
1126 \iffirst@linenum@out@
1127   \immediate\closeout\linenum@out%
1128   \global\first@linenum@out@false%
1129   \immediate\openout\linenum@out=#1\relax%

```

\startsub \startsub and \endsub turn sub-lineation on and off, by writing appropriate instructions to the line-list file. When sub-lineation is in effect, the line number counter is frozen and the sub-line counter advances instead. If one of these commands appears in the middle of a line, it does not take effect until the next line; in other words, a line is counted as a line or sub-line depending on what it started out as, even if that changes in the middle.

We tinker with \lastskip because a command of either sort really needs to be attached to the last word preceding the change, not the first word that follows the change. This is because sub-lineation will often turn on and off in mid-line—stage directions, for example, often are mixed with dialogue in that way—and when a line is mixed we want to label it using the system that was in effect at its start. But when sub-lineation begins at the very start of a line we have a problem, if we don't put in this code.

```

1192

VI Marking text for notes

The `\edtext` macro is used to create all footnotes and endnotes, as well as to print the portion of the main text to which a given note or notes is keyed. The idea is to have that lemma appear only once in the `.tex` file: all instances of it in the main text and in the notes are copied from that one appearance.

The `\edtext` macro takes two arguments.

```
\edtext{#1}{#2}
```

- #1 is the piece of the main text being glossed; it gets added to the main text, and is also used as a lemma for notes to it.
- #2 is a series of subsidiary macros that generate various kinds of notes.

The `\edtext` macro may be used (somewhat) recursively; that is, `\edtext` may be used within its own first argument. The code would be much simpler without this feature, but nested notes will commonly be necessary: it is quite likely that we will have an explanatory note for a long passage and notes on variants for individual words within that passage. The situation we can't handle is overlapping notes that are not nested: for example, one note covering lines 10–15, and another covering 12–18. You can handle such cases by using the `\lemma` and `\linenum` macros within #2: they alter the copy of the lemma and the line numbers that are passed to the notes, and hence allow you to overcome any limitations of this system, albeit with extra effort.

The recursive operation of `\edtext` will fail if you try to use a copy that is called something other than `\edtext`. In order to handle recursion, `\edtext` needs to redefine its own definition temporarily at one point, and that does not work if the macro you are calling is not actually named `\edtext`. There is no problem as long as `\edtext` is not invoked in the first argument. If you want to call `\edtext` something else, it is best to create instead a macro that expands to an invocation of `\edtext`, rather than copying `\edtext` and giving it a new name; otherwise you will need to add an appropriate definition for your new macro to `\morenoexpands`.

Side effects of our line-numbering code make it impossible to use the usual footnote macros directly within a paragraph whose lines are numbered (see comments to

\do@line, VII.2.1 p. 122). Instead, the appropriate note-generating command is appended to the list macro \inserts@list, and when \pend completes the paragraph it inserts all the notes at the proper places.

Note that we do not provide previous-note information, although it is often wanted; your own macros must handle that. We can not do it correctly without keeping track of what kind of notes have gone past: it is not just a matter of remembering the line numbers associated with the previous invocation of \edtext, because that might have been for a different kind of note. It is preferable for your footnote macros to store and recall this kind of information if they need it.

VI.1 \edtext itself

The various note-generating macros might want to request that commands be executed not at once, but in close connection with the start or end of the lemma. For example, footnote numbers in the text should be connected to the end of the lemma; or, instead of a single macro to create a note listing variants, you might want to use several macros in series to create individual variants, which would each add information to a private macro or token register, which in turn would be formatted and output when all of #2 for the lemma has been read.

`\end@lemmas` To accomodate this, we provide a list macro to which macros may add commands that should subsequently be executed at the end of the lemma when that lemma is added to the text of the paragraph. A macro should add its contribution to \end@lemmas by using \xleft@appenditem. (Anything that needs to be done at the *start* of the lemma may be handled using \aftergroup, since the commands specified within \edtext's second argument are executed within a group that ends just before the lemma is added to the main text.)

\end@lemmas is intended for the few things that need to be associated with the end of the lemma, like footnote numbers. Such numbers are not implemented in the current version, and indeed no use is currently made of \end@lemmas or of the \aftergroup trick. The general approach would be to define a macro to be used within the second argument of \edtext that would add the appropriate command to \end@lemmas.

Commands that are added to this list should always take care not to do anything that adds possible line-breaks to the output; otherwise line numbering could be thrown off.

```
1268 \list@create{\end@lemmas}
1269 %
```

`\dummy@edtext` We now need to define a number of macros that allow us to weed out nested instances of \edtext, and other problematic macros, from our lemma. This is similar to what we did in reading the line-list file using \dummy@ref and various redefinitions—and that is because nested \edtexts macros create nested \ceref entries in the line-list file.

```
1270 \newcommand{\dummy@edtext}[2]{#1}
1271 %
```

`\dummy@edtext@showlemma` Some time, we want to obtain only the first argument of \edtext, while also wrapping it in \showlemma. For example, when printing a \eledsection.

```

1272 \newcommand{\dummy@edtext@showlemma}[2]{\showlemma{#1}}%
1273 %

```

We are going to need another macro that takes one argument and ignores it entirely. This is supplied by the L^AT_EX \gobble{<arg>}.

\no@expands We need to turn off macro expansion for certain sorts of macros we are likely to see within the lemma and within the notes.

The first class is font-changing macros. We suppress expansion for them by letting them become equal to zero.²⁴ This is done because we want to pass into our notes the generic commands to change to roman or whatever, and not their expansions that will ask for a particular style at a specified size. The notes may well be in a smaller font, so the command should be expanded later, when the note's environment is in effect.

A second sort to turn off includes a few of the accent macros. Most are not a problem: an accent that is expanded to an \accent command may be harder to read but it works just the same. The ones that cause problems are: those that use alignments—T_EX seems to get confused about the difference between alignment parameters and macro parameters; those that use temporary control sequences; and those that look carefully at what the current font is.

(The \copyright macro defined in PLAIN T_EX has this sort of problem as well, but is not used enough to bother with. That macro, and any other that causes trouble, will get by all right if you put a \protect in front of it in your file.)

We also need to eliminate all reledmac macros like \edlabel and \setline that write things to auxiliary files: that writing should be done only once. And we make \edtext itself, if it appears within its own argument, do nothing but copy its first argument.

Finally, we execute \morenoexpands. The version of \morenoexpands defined here does nothing; but you may define a version of your own when you need to add more expansion suppressions as needed with your macros. That makes it possible to make such additions without needing to copy or modify the standard reledmac code. If you define your own \morenoexpands, you must be very careful about spaces: if the macro adds any spaces to the text when it runs, extra space will appear in the main text when \edtext is used.

(A related problem, not addressed by these two macros, is that of characters whose category code is changed by any the macros used in the arguments to \edtext. Since the category codes are set when the arguments are scanned, macros that depend on changing them will not work. We have most often encountered this with characters that are made ‘active’ within text in some, but not all, of the languages used within the document. One way around the problem, if it takes this form, is to ensure that those characters are *always* active; within languages that make no special use of them, their associated control sequences should simply return the proper character. A simpler solution is to avoid active character, using L^AT_EX or X^AT_EX.)

```

1274 \newcommand*{\no@expands}{%

```

²⁴Since ‘control sequences equivalent to characters are not expandable’—*The TeXbook*, answer to Exercise 20.14.

1318       \fi%
1319     }%
1320   }%
1321 %

```

\@tag Our normal lemma is just argument #1; but that argument could have further invocations of \edtext within it. We get a copy of the lemma without any \edtext macros within it by temporarily redefining \edtext to just copy its first argument and ignore the other, and then expand #1 into \@tag, our lemma.

This is done within a group that starts here, in order to get the original \edtext restored; within this group we have also turned off the expansion of those control sequences commonly found within text that can cause trouble for us.

```

1318   \global\renewcommand{\@tag}{%
1319     \no@expands #1%
1320   }%
1321 %

```

\l@d@nums Prepare more data for the benefit of note-generating macros: the line references and font specifier for this lemma go to \l@d@nums.

```

1322   \set@line%
1323 %

```

\insert@count will be altered by the note-generating macros: it counts the number of deferred footnotes or other insertions generated by this instance of \edtext. If we are in a right column (reledpar), we use \insert@countR instead of \insert@count.

```

1324   \ifledRcol \global\insert@countR \z@%
1325   \else     \global\insert@count \z@ \fi%
1326 %

```

Now process the note-generating macros in argument #2 (i.e., \Afootnote, \lemma, etc.). \ignorespaces is here to skip over any spaces that might appear at the start of #2; otherwise they wind up in the main text. Footnote and other macros that are

used within #2 should all end with \ignorespaces as well, to skip any spaces between macros when several are used in series.

```
1327   \ignorespaces #2\relax%
1328 %
```

With polyglossia, you must track whether the language reads left to right (English) or right to left (Arabic).

```
1329   \@ifundefined{xpg@main@language}{%if not polyglossia
1330     \flag@start}%

```

\set@line The \set@line macro is called by \edtext to put the line-reference field and font specifier for the current block of text into \l@d@nums.

One instance of \edtext may generate several notes, or it may generate none – it is legitimate for argument #2 to \edtext to be empty. But \flag@start and \flag@end induce the generation of a single entry in \line@list during the next run, and it is vital to also remove one and only one \line@list entry here.

If no more lines are listed in \line@list, something is wrong – probably just some change in the input. We set all the numbers to zeros, following an old publishing convention for numerical references that have not yet been resolved.

```

1375 \newcommand*{\set@line}{%

VI.2 Substitute lemma

\lemma The `\lemma{<text>}` macro allows you to change the lemma that is passed on to the notes. Read about `\@tag` in normal `\edtext` macro for more details about `\sw@list@inedtext` and `\no@expands` (VI.1 p. 106).

```

1400 \unless\ifnocritical@
1401 \newcommand*{\lemma}[1]{%
1402   \global\@lemmacommand@true%
1403   \global\renewcommand{\@tag}{%
1404     \no@expands #1%
1405   }%
1406   \ignorespaces%
1407 }%
1408 %

```

\@lemma The `\@lemma` is written in the numbered file to set which `\edtext` has an `\lemma` as second argument.

```

1409 \newcommand{\@lemma}{%
1410   \booltrue{lemmacommand@\the\@edtext@level}%
1411 }%

```

```
1412 \fi
1413 %
```

- `\if@lemmacommand@` This boolean is set to TRUE inside a `\edtext` (or `\critext`) when a `\lemma` command is called. That is useful for some commands which can have a different behavior if the lemma in the note is different from the lemma in the main text.

```
1414 \newif\if@lemmacommand@
1415 %
```

VI.3 Substitute line numbers

- `\linenum` The `\linenum` macro can change any or all of the page and line numbers that are passed on to the notes.

As argument `\linenum` takes a set of seven parameters separated by vertical bars, in the format used internally for `\l@d@nums` (see V.9 p. 81): the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma. However, you can omit any parameters you do not want to change, and you can omit a string of vertical bars at the end of the argument. Hence `\linenum{18|4|0|18|7|1|0}` is an invocation that changes all the parameters, but `\linenum{|3|}` only changes the starting line number, and leaves the rest unaltered.

We use `\`` as an internal separator for the macro parameters.

```
1416 \newcommand*{\linenum}[1]{%
1417   \xdef\@tempa{\#1|||||\noexpand\\\l@d@nums}%
1418   \global\let\l@d@nums=\empty
1419   \expandafter\line@set\@tempa\\\ignorespaces}
1420 %
```

- `\line@set` `\linenum` calls `\line@set` to do the actual work; it looks at the first number in the argument to `\linenum`, sets the corresponding value in `\l@d@nums`, and then calls itself to process the next number in the `\linenum` argument, if there are more numbers in `\l@d@nums` to process.

```
1421 \def\line@set#1|#2|\#3|\#4\\{%
1422   \gdef\@tempb{\#1}%
1423   \ifx\@tempb\empty
1424     \l@d@add{\#3}%
1425   \else
1426     \l@d@add{\#1}%
1427   \fi
1428   \gdef\@tempb{\#4}%
1429   \ifx\@tempb\empty\else
1430     \l@d@add{}|\line@set#2|\#4\\%
1431   \fi}
1432 %
```

- `\l@d@add` `\line@set` uses `\l@d@add` to tack numbers or vertical bars onto the right hand end of `\l@d@nums`.

```

1433 \newcommand{\l@d@add}[1]{\xdef\l@d@nums{\l@d@nums#1}}
1434 %
1435 %

```

VI.4 Lemma disambiguation

The mechanism which counts the occurrence of a same word in a same line is quite complex, because, when L^AT_EX reads a command between a `\pstart` and a `\pend`, it does not know yet which are the line numbers.

The general mechanism is the following:

- **At the first run**, each `\sameword` command increments an `etoolbox` counter the name of which contains the argument of the `\sameword` commands.
- Then this counter, associated with the argument of `\sameword` is stored, with the `\@sw` command, in the auxiliary file of the current `eledmac` section (the `.1`, `.2...` file).
- **When this auxiliary file is read at the second run**, different operations are achieved:
 1. Get the rank of each `\sameword` in a line (relative rank) from the rank of each `\sameword` in all the numbered section (absolute rank):
 - For each paired `\sameword` argument and absolute line number, a counter is defined. Its value corresponds to the number of times `\sameword{<argument>}+` is called from the beginning of the lineation to the end of the current line. We also store the same data for the preceding absolute line number, if it does not have `\sameword{<argument>}+`.
 - For each `\sameword` having the same argument, we subtract from its absolute rank the number stored for the paired `\sameword` argument and previous absolute line number. Consequently, we obtain the relative rank.
 - See the following example which explain how for same `\sameword` absolute ranks are transformed to relative rank.

```

At line 1:
absolute rank 1 becomes relative rank 1-0 = 1
1 is stored for this \sameword and the line 1
At line 2:
absolute rank 2 becomes relative rank 2-1 = 1
absolute rank 3 becomes relative rank 3-2 = 2
3 is stored for this \sameword and the line 2
At line 3:
no \sameword for this line.
3 is stored for this \sameword and the line 3
At line 4:
absolute rank 4 becomes relative rank 4-3 = 1
3 is stored for this \sameword and the line 4

```

2. Create lists of lists of \saweword by depth of \edtext. That is: create a list for \edtext of level 1, a list for \edtext of level 2, a list for \edtext of level 3 etc. For each \edtext in these list, we store all the relative rank of \saweword which are called as lemma information, that is 1) or called in the first argument of \saweword 2) or called in the \lemma macro of the second argument of \saweword AND marked by the optional argument of \saweword in first argument of \edtext.

For example, suppose a line with nested \edtexts which contains some word marked by \saweword and having the following relative rank:

bar ¹	foo ¹ foo ² bar ² foo ³	(A)(B) foo ⁴ bar ³	(C)	foo ⁵	(D) bar ⁴	(E)
------------------	---	--	-----	------------------	----------------------	-----

In this example, all lemma information for \edtext is framed. The text in parenthesis is the content of critical notes associated to the preceding frame. As you can see, we have two level of \edtext.

The list for \edtexts of level 1 is $\{\{1, 2, 2, 3, 4, 3\}, \{5, 4\}\}$.

The list for \edtexts of level 2 is $\{\{1, 2, 2, 3\}, \{5\}\}$.

As you can see, the mandatory argument of \saweword does not matter: we store the rank informations for every word potentially ambiguous.

- At the second run, when a critical notes is called, we associate it to the next item of the list associated to is \edtext level. So, in the previous example:
 - Critical notes (A) and (B) are associated with $\{1, 2, 2, 3\}$.
 - Critical note (C) is associated with $\{1, 2, 2, 3, 4, 3\}$.
 - Critical note (D) is associated with $\{5\}$.
 - Critical note (E) is associated with $\{5, 4\}$.
- At the second run, when a critical note is printed:
 - The \saweword command is let \saweword@inedtext.
 - At each call of this \saweword@inedtext, we step to the next element of the list associated to the note. Let it be r .
 - For the word marked by \saweword, we calculate how many time it is called in its line. To do it:
 - * We get the absolute line number of the current \saweword. This absolute line number was stored with list of relative rank for the current \edtext. That means, in the previous example, that, if the absolute line number of \edtext was 1, that critical notes (A) and (B) were not associated with $\{1, 2, 2, 3\}$ but with $\{(1, 1), (2, 1), (2, 1), (3, 1)\}$. Such method to know the absolute line number associated to a \saweword is required because a \edtext can be overlap many lines, but \saweword can't get it.
 - * We get the value associated, when reading the auxiliary file, to the pair composed by the current marked word and the current absolute line number. Let this value be n .

- If $n > 1$, that mean the current word appears more than once time in its line. In this case, we call \showwordrank with the word as first argument and r as second argument. If the word is called only once, we just print it.

After theory, implementation.

`\get@sw@txt` As the argument of \sameword can contain active character if we use `inputenc` with `utf8` option instead of native UTF-8 engine, we store its detokenized content in a macro in order to allow dynamic name of macro with `\csname`.²⁵

Because there is a bug with `\detokenize` and X_ET_EX when using non BMP characters²⁶, we detokenize only for not X_ET_EXengines. In any case, in X_ET_EX, a `\csname` construction can contain UTF-8 characters without a problem, as UTF-8 characters are not managed with category code, but instead read directly as UTF-8 characters.

```
1436 \newcommand{\get@sw@txt}[1]{%
1437   \ifxetex%

VII Paragraph decomposition and reassembly

In order to be able to count the lines of text and affix line numbers, we add an extra stage of processing for each paragraph. We send the paragraph into a box register, rather than straight onto the vertical list, and when the paragraph ends we slice the paragraph into its component lines; to each line we add any notes or line numbers, add a command to write to the line-list, and then at last send the line to the vertical list. This section contains all the code for this processing.

VII.1 Boxes, counters, \pstart and \pend

\raw@text Here are numbers and flags that are used internally in the course of the paragraph decomposition.
\ifnumberedpar@ When we first form the paragraph, it goes into a box register, \raw@text, instead of onto the current vertical list. The \ifnumberedpar@ flag will be true while a paragraph is being processed in that way. \num@lines will store the number of lines in the paragraph when it is complete. When we chop it up into lines, each line in turn goes into the \one@line register, and \par@line will be the number of that line within the paragraph.

```
1567 \newbox\raw@text
1568 \newif\ifnumberedpar@
1569 \newcount\num@lines
1570 \newbox\one@line
1571 \newcount\par@line
1572 %
```

\pstart \pstart starts the paragraph by clearing the \inserts@list list and other relevant variables, and then arranges for the subsequent text to go into the \raw@text box.
\AtEveryPstart \pstart needs to appear at the start of every paragraph that is to be numbered; the \autopar command below may be used to insert these commands automatically.
\labelpstarttrue Beware: everything that occurs between \pstart and \pend is happening within
\labelpstartfalse a group; definitions must be global if you want them to survive past the end of the
\thepstart paragraph.

\autopar In most cases it is only an annoyance to have to label the paragraphs to be numbered with \pstart and \pend. \autopar will do that automatically, allowing you to start a paragraph with its first word and no other preliminaries, and to end it with

a blank line or a `\par` command. The command should be issued within a group, after `\beginnumbering` has been used to start the numbering; all paragraphs within the group will be affected.

A few situations can cause problems. One is a paragraph that begins with a begin-group character or command: `\pstart` will not get invoked until after such a group beginning is processed; as a result the character that ends the group will be mistaken for the end of the `\vbox` that `\pstart` creates, and the rest of the paragraph will not be numbered. Such paragraphs need to be started explicitly using `\indent`, `\noindent`, or `\leavevmode` – or `\pstart`, since you can still include your own `\pstart` and `\pend` commands even with `\autopar` on.

Prematurely ending the group within which `\autopar` is in effect will cause a similar problem. You must either leave a blank line or use `\par` to end the last paragraph before you end the group.

The functioning of this macro is more tricky than the usual `\everypar`: we do not want anything to go onto the vertical list at all, so we have to end the paragraph, erase any evidence that it ever existed, and start it again using `\pstart`. We remove the paragraph-indentation box using `\lastbox` and save the width, and then skip backwards over the `\parskip` that has been added for this paragraph. Then we start again with `\pstart`, restoring the indentation that we saved, and locally change `\par` so that it will do our `\pend` for us.

```

1821 %

```

VIII Line and page number computation

\getline@num The \getline@num macro determines the page and line numbers for the line we are
 about to send to the vertical list.

```

1822 \newcommand*{\getline@num}{%
1823   \global\advance\absline@num \cne%
1824   \do@actions
1825   \do@ballast

```

```

1826 \ifnumberline
1827   \ifsublines@
1828     \ifnum\sub@lock<\tw@
1829       \global\advance\subline@num \z@ne
1830     \fi
1831   \else
1832     \ifnum\@clock<\tw@
1833       \global\advance\line@num \z@ne
1834       \global\subline@num \z@ne
1835     \fi
1836   \fi
1837 \fi
1838 }
1839 %

```

\do@ballast The real work in the macro above is done in `\do@actions`, but before we plunge into that, let's get `\do@ballast` out of the way. This macro looks to see if there is an action to be performed on the *next* line, and if it is going to be a page break action, `\do@ballast` decreases the count `\ballast@count` counter by the amount of `ballast`. This means, in practice, that when `\add@penalties` assigns penalties at this point, TeX will be given extra encouragement to break the page here (see XI.2 p. 135).

\ballast@count First we set up the required counters; they are initially set to zero, and will remain so unless you say `\setcounter{ballast}{<some figure>}` in your document.

```

1840 \newcount\ballast@count
1841 \newcounter{ballast}
1842   \setcounter{ballast}{0}
1843 %

```

And here is `\do@ballast` itself. It advances `\absline@num` within the protection of a group to make its check for what happens on the next line.

```

1844 \newcommand*\do@ballast{\global\ballast@count \z@
1845   \begingroup
1846     \advance\absline@num \z@ne
1847     \ifnum\next@actionline=\absline@num
1848       \ifnum\next@action>-1001\relax
1849         \global\advance\ballast@count by -\c@ballast
1850       \fi
1851     \fi
1852   \endgroup
1853 %

```

\do@actions The `\do@actions` macro looks at the list of actions to take at particular absolute line numbers, and does everything that is specified for the current line.

It may call itself recursively, and to do this efficiently (using TeX's optimization for tail recursion), we define a control-sequence called `\do@actions@next` that is always the last thing that `\do@actions` does. If there could be more actions to process for this line, `\do@actions@next` is set equal to `\do@actions`; otherwise it is just `\relax`.

```

1854 \newcommand*{\do@actions}{%
1855   \global\let\do@actions@next=\relax
1856   \ifnum\absline@num<\next@actionline\else
1857   %

```

First, page number changes, which will generally be the most common actions. If we are restarting lineation on each page, this is where it happens.

```

1858   \ifnum\next@action>-1001
1859     \global\page@num=\next@action
1860     \ifbypage@
1861       \global\line@num=\z@ \global\subline@num=\z@
1862       \resetprevline@
1863     \fi
1864 %

```

Next, we handle commands that change the line-number values. (We subtract 5001 rather than 5000 here because the line number is going to be incremented automatically in `\getline@num`.)

```

1865   \else
1866     \ifnum\next@action<-4999
1867       @_@dtempcnta=-\next@action
1868       \advance @_@dtempcnta by -5001
1869       \ifsublines@
1870         \global\subline@num=@_@dtempcnta
1871       \else

IX Line number printing

\affixline@num `\affixline@num` just puts a left line number into `\l@dld@ta` or a right line number into `\l@drd@ta` if required.

To determine whether we need to affix a line number to this line, we compute the following:

$$\begin{aligned} n &= \text{int}((\text{linenum} - \text{firstlinenum}) / \text{linenumincrement}) \\ m &= \text{firstlinenum} + (n \times \text{linenumincrement}) \end{aligned}$$

(where `int` truncates a real number to an integer). m will be equal to `linenum` only if we are to paste a number on here. However, the formula breaks down for the first line to number (and any before that), so we check that case separately: if `\line@num ≤ \firstlinenum`, we compare the two directly instead of making these calculations.

We compute, in the scratch counter `\@1@dtmpcnta`, the number of the next line that should be printed with a number (m in the above discussion), and move the current line number into the counter `\@1@dtmpcntb` for comparison.

First, the case when we are within a sub-line range.

```
1928 \newcommand*{\affixline@num}{%
1929   %

```

If we got here, we are going to print a line number; so now we need to calculate a number that will tell us which side of the page will get the line number. We start from `\line@margin`, which asks for one side always if it is less than 2; and then if the side does depend on the page number, we simply add the page number to this side code—because the values of `\line@margin` have been devised so that this produces a number that is even for left-margin numbers and odd for right-margin numbers.

For `ETEX` we have to consider two column documents as well. In this case Peter Wilson thought we need to put the numbers at the outside of the column — the left of the first column and the right of the second. Do the `twocolumn` stuff before going on with the original code.

\l@ldd@ta A left line number is stored in \l@ldd@ta and a right one in \l@drd@ta.

```

X Pstart number printing in side

In side, the printing of pstart number is running like the printing of line number. There is only some differences:

```
\affixpstart@num
\pstartnum
```

- The pstarts counter is upgrade in the \pend command. Consequently, the \affixpstart@num command has not to upgrade it, unlike the \affixline@num which upgrades the lines counter.

- To print the pstart number only at the beginning of a pstart, and not in every line, a boolean test is made. The `\pstartnum` boolean is set to TRUE at every `\pend`. It is tried in the `\leftpstartnum` and `\rightpstartnum` commands. After the try, it is set to FALSE.

```

XI Restoring footnotes and penalties

Because of the paragraph decomposition process in order to number line, `reledmac` must hack the standard way TeX works in order to manage insertion of footnotes, both critical and familiar.

We need to call the `\insert` commands not when the content of `\pstart...\pend` is read by TeX by when each individual line is typeset.

Consequently, when reading the content of `\pstart...\pend`, we store the insertion (footnotes) in an specific `reledmac`'s list, and we restore them to the vertical list when printing each individual line.

XI.1 Add insertions to the vertical list

`\inserts@list` `\inserts@list` is the list macro that contains the inserts that we save up for one paragraph.

```
2095 \list@create{\inserts@list}
2096 %
```

`\add@inserts` `\add@inserts` is the penultimate macro used by `\do@line`; it takes insertions saved in `\add@inserts@next` a list macro and sends them onto the vertical list.

It may call itself recursively, and to do this efficiently (using TeX's optimization for tail recursion), we define a control-sequence called `\add@inserts@next` that is always the last thing that `\add@inserts` does. If there could be more inserts to process for this line, `\add@inserts@next` is set equal to `\add@inserts`; otherwise it is just `\relax`.

```
2097 \newcommand*{\add@inserts}{%
2098   \global\let\add@inserts@next=\relax
2099 %}
```

If `\inserts@list` is empty, there are not any more notes or insertions for this paragraph, and we need not waste our time.

```
2100 \ifx\inserts@list\empty \else
2101 %
```

The `\next@insert` macro records the number of the line that receives the next footnote or other insert; it is empty when we start out, and just after we have affixed a note or insert.

```
2102 \ifx\next@insert\empty
2103   \ifx\insertlines@list\empty
2104     \global\noteschanged@true
2105     \gdef\next@insert{100000}%
2106   \else
2107     \gl@p\insertlines@list\to\next@insert
2108   \fi
2109 \fi
2110 %
```

If the next insert's for this line, tack it on (and then erase the contents of the insert macro, as it could be quite large). In that case, we also set `\add@inserts@next` so that we will call ourself recursively: there might be another insert for this same line.

```

2111 \ifnum\next@insert=\absline@num
2112   \gl@p\inserts@list\to@\insert
2113   \@insert
2114   \global\let\@insert=\undefined
2115   \global\let\next@insert=\empty
2116   \global\let\add@inserts@next=\add@inserts
2117   \fi
2118 \fi
2119 %

```

Make the recursive call, if necessary.

```

2120 \add@inserts@next
2121
2122 %

```

XI.2 Penalties

`\add@penalties` `\add@penalties` is the last macro used by `\do@line`. It adds up the club, widow, and interline penalties, and puts a single penalty of the appropriate size back into the paragraph; these penalties get removed by the `\vsplit` operation. `\displaywidowpenalty` and `\brokenpenalty` are not restored, since we have no easy way to find out where we should insert them.

In this code, `\num@lines` is the number of lines in the whole paragraph, and `\par@line` is the line we are working on at the moment. The count `\@l@dtempcnta` is used to calculate and accumulate the penalty; it is initially set to the value of `\ballast@count`, which has been worked out in `\do@ballast` above (VIII p. 126). Finally, the penalty is checked to see that it does not go below -10000 .

```

2123 \newcommand*{\add@penalties}{\@l@dtempcnta=\ballast@count
2124   \ifnum\num@lines>\@ne
2125     \global\advance\par@line \@ne
2126     \ifnum\par@line=\@ne
2127       \advance\@l@dtempcnta \clubpenalty
2128     \fi
2129     \@l@dtempcntb=\par@line \advance\@l@dtempcntb \@ne
2130     \ifnum\@l@dtempcntb=\num@lines
2131       \advance\@l@dtempcnta \widowpenalty
2132     \fi
2133     \ifnum\par@line<\num@lines
2134       \advance\@l@dtempcnta \interlinepenalty
2135     \fi
2136   \fi
2137   \ifnum\@l@dtempcnta=\z@
2138     \relax
2139   \else

```

```

2140   \ifnum\@l@dtmpcnta>-10000
2141     \penalty\@l@dtmpcnta
2142   \else
2143     \penalty -10000
2144   \fi
2145 \fi}
2146 %
2147 %

```

XI.3 Printing leftover notes

- \flush@notes** The `\flush@notes` macro is called after the entire paragraph has been sliced up and sent on to the vertical list. If the number of notes to this paragraph has increased since the previous run of TeX, then there can be leftover notes that have not yet been printed. An appropriate error message will be printed elsewhere; but it is best to go ahead and print these notes somewhere, even if it is not in quite the right place. What we do is dump them all out here, so that they should be printed on the same page as the last line of the paragraph. We can hope that is not too far from the proper location, to which they will move on the next run.

```

2148 \newcommand*{\flush@notes}{%
2149   \cloop
2150   \ifx\inserts@list\empty \else
2151     \glp\inserts@list\to\@insert
2152     \@insert
2153     \global\let\@insert=\undefined
2154   \repeat}
2155 %
2156 %

```

- \cloop** `\cloop` is a variant of the PLAIN TeX `\loop` macro, useful when it's hard to construct a positive test using the TeX `\if` commands—as in `\flush@notes` above. One says `\cloop ... \if ... \else ... \repeat`, and the action following `\else` is repeated as long as the `\if` test fails. (This macro will work wherever the PLAIN TeX `\loop` is used, too, so we could just call it `\loop`; but it seems preferable not to change the definitions of any of the standard macros.)

This variant of `\loop` was introduced by Alois Kabelschacht in *TUGboat* 8 (1987), pp. 184–5.

```

2157 \def\cloop#1\repeat{%
2158   \def\body{\#1\expandafter\body\fi}%
2159   \body
2160 }
2161 %

```

XII Critical footnotes

The footnote macros are adapted from those in PLAIN TeX, but they differ in these respects: the outer-level commands must add other commands to a list macro rather than doing insertions immediately; there are many separate levels of the footnotes, not just one; and there are options to reformat footnotes into paragraphs or into multiple columns.

XII.1 Fonts

Before getting into the details of formatting the notes, we set up some font macros. It is the notes that present the greatest challenge for our font-handling mechanism, because we need to be able to take fragments of our main text and print them in different forms: it is common to reduce the size, for example, without otherwise changing the fonts used.

`\select@lemmafont` `\select@lemmafont` is provided to set the right font for the lemma in a note. This macro extracts the font specifier from the line and page number cluster, and issues the associated font-changing command, so that the lemma is printed in its original font.

```

2162 \def\select@lemmafont#1|#2|#3|#4|#5|#6|#7{\select@lemmafont#7}
2163 \def\select@lemmafont#1/#2/#3/#4%

XII.4 General survey of the way we manage notes

The processing of each note is done by four principal macros: the `\vfootnote` macro takes the text of the footnote and does the `\insert`; it calls on the `\footfmt` macro to select the right fonts, print the line number and lemma, and do any other formatting needed for that individual note. Within the output routine, the two other macros, `\footstart` and `\footgroup`, are called; the first prints extra vertical space and a footnote rule, if desired; the second does any reformatting of the whole set of the footnotes in this series for this page—such as paragraphing or division into columns—and then sends them to the page.

These four macros, and the other macros and parameters shown here, are distinguished by the ‘series letter’ that indicates which set of the footnotes we are dealing with—A, B, C, D, or E. The series letter always precedes the string `foot` in macro and parameter names. Hence, for the A series, the four macros are called `\vAfootnote`, `\Afootfmt`, `\Afootstart`, and `\Afootgroup`.

These macros are changed depending of the footnotes arrangement: “normal”, “paragraphed”, “two columns” or “three columns”.

XII.5 General setup

`\footsskip` Some setup code that is common for a variety of the footnotes. The setup is for:

- `\interlinepenalty`.
- `\splittopskip` (skip before last part of notes that flow from one page to another).
- `\splitmaxdepth`.
- `\floatingpenalty`, that is penalty values being added when a long note flows from one page to another. Here, we let it to 0 when we are processing parallel pages in `eledpar`, in order to allow notes to flow from left to right pages and *vice-versa*. Otherwise, we let it to `\@MM`, which is the standard `\TeX` `\floatingpenalty`.

```

2222 \newcommand*{\footsskip}{%
2223   \interlinepenalty=\interfootnotelinepenalty
2224   \unless\ifl@dprintingpages%
2225     \floatingpenalty=\@MM%
2226   \fi%

```

```

2227 \splittopskip=\ht\strutbox \splitmaxdepth=\dp\strutbox
2228 \leftskip=\z@skip \rightskip=\z@skip}
2229 %
230 %

```

\normalfootnoterule *\normalfootnoterule* is a standard footnote-rule macro, for use by a *footstart* macro: just the same as the PLAIN *TEX* footnote rule.

```

231 \let\normalfootnoterule=\footnoterule
232 %

```

XII.6 Footnotes arrangement

XII.6.1 User level macro

\Xarrangement *\Xarrangement* [*s*] {*arrangement*} The command calls, for each series, a specific command which set many counters and commands in order to define specific arrangement.

```

233 \newcommandx{\Xarrangement}[2][1,usedefault]{%
234   \def\do##1{%
235     \csname Xarrangement@##2\endcsname{##1}%
236   }%
237   \ifstrempty{##1}{%
238     {}%
239     \dolistloop{\@series}%
240   }%
241   {%
242     \docs vlist{##1}%
243   }%
244 }%
245 %

```

XII.6.2 Normal footnote

\Xarrangement@normal We can now define all the parameters for the series of footnotes; initially they use the “normal” footnote formatting.

What we want to do here is to say something like the following for each footnote series. (This is an example, not part of the actual *reledmac* code.)

```

\skip\Afootins=12pt plus5pt minus5pt
\count\Afootins=1000
\dimen\Afootins=0.8\vsiz
\let\vAfootnote=\normalvfootnote \let\Afootfmt=\normalfootfmt
\let\Afootstart=\normalfootstart \let\Afootgroup=\normalfootgroup
\let\Afootnoterule=\normalfootnoterule

```

(Read *The TeXbook* in order to understand what are the counter, skip and dimen associated to an insertion.)

Instead of repeating ourselves, we define a `\Xarrangement@normal` macro that makes all these assignments for us, for any given series letter. This command is called when people use `\Xarrangement[⟨series⟩]{normal}`

Now we set up the `\Xarrangement@normal` macro itself. It takes one argument: the footnote series letter.

```

2246 \newcommand*\Xarrangement@normal}[1]{%
2247   \csgdef{series@display#1}{normal}
2248   \expandafter\let\csname #1footstart\endcsname=\normalfootstart
2249   \expandafter\let\csname v#1footnote\endcsname=\normalvfootnote
2250   \expandafter\let\csname #1footfmt\endcsname=\normalfootfmt
2251   \expandafter\let\csname #1footgroup\endcsname=\normalfootgroup
2252   \expandafter\let\csname #1footnoterule\endcsname=%
2253                           \normalfootnoterule
2254   \count\csname #1footins\endcsname=1000
2255   \dimen\csname #1footins\endcsname=\csuse{Xmaxhnotes@#1}
2256   \skip\csname #1footins\endcsname=\csuse{Xbeforenotes@#1}%
2257   \advance\skip\csname #1footins\endcsname by\csuse{Xafterrule@#1}%
2258 %

```

The `reledpar` provides tools in order to confine notes to one side. The mechanism is explained in the `reledpar`'s handbook. For now, just retain we need to store default value of the counter associated to the notes `TeX`'s inserts.

```

2259   \csxdef{default@#1footins}{1000}%Use this to confine the notes to one
2260   side only
2261 %

```

Now do the setup for minipage footnotes. We use as much as possible of the normal setup as we can (so the notes will have a similar layout).

```

2261   \ifnoledgroup@\else%
2262     \expandafter\let\csname mpv#1footnote\endcsname=\mpnnormalvfootnote
2263     \expandafter\let\csname mp#1footgroup\endcsname=\mpnnormalfootgroup
2264     \count\csname mp#1footins\endcsname=1000
2265     \dimen\csname mp#1footins\endcsname=\csuse{Xmaxhnotes@#1}
2266     \skip\csname mp#1footins\endcsname=\csuse{Xbeforenotes@#1}%
2267     \advance\skip\csname mp#1footins\endcsname by\csuse{Xafterrule@#1}%
2268   \fi
2269 }
2270 %
2271 %

```

\normalvfootnote We now begin a series of commands that do ‘normal’ footnote formatting: a format much like that implemented in PLAIN `TeX`, in which each footnote is a separate paragraph.

`\normalvfootnote` takes the series letter as #1, and the entire text of the footnote is #2. It does the `\insert` for this note, calling on the `\footfmt` macro for this note series to format the text of the note.

```

2272 \notbool{parapparatus@}{\newcommand*{\newcommand}{\normalvfootnote}[2]{%
2273   \insert\csname #1footins\endcsname\bgroup
2274   \noindent\csuse{Xhooknote@#1}%
2275   \csuse{Xnotefontsize@#1}%
2276   \footnoteskip
2277   \ifl@dpairing\ifl@dpaging\else%
2278     \setXnoteswidthliketwocolumns@{#1}%
2279   \fi\fi%
2280   \setXnotespositionliketwocolumns@{#1}%
2281   \spaceskip=\z@skip \xspaceskip=\z@skip
2282   \csname #1footfmt\endcsname #2{#1}\egroup}
2283 %

```

\mpnormalvfootnote And a somewhat different version for minipages.

```

2284 \notbool{parapparatus@}{\newcommand*{\newcommand}{\mpnormalvfootnote}[2]{%
2285   \global\setbox\@nameuse{mp#1footins}\vbox{%
2286     \unvbox\@nameuse{mp#1footins}%

2303     Xlemmaseparator@#4}%
2304       {\hskip\csuse{Xinplaceoflemmaseparator@#4}}%
2305       {\nobreak\hskip\csuse{Xbeforelemmaseparator@#4}\csuse{Xlemmaseparator@%
2306         #4}\hskip\csuse{Xafterlemmaseparator@#4}\relax}%
2307   }%
2308   #3\strut\par}
2309 %

```

\normalfootstart \normalfootstart is a standard footnote-starting macro, called in the output routine whenever there are footnotes of this series to be printed: it skips a bit and then draws a rule.

Any \footstart macro must put onto the page something that takes up space exactly equal to the \skip\Xfootins value for the associated series of notes. TeX makes page computations based on that \skip value, and the output pages will suffer from spacing problems if what you add takes up a different amount of space.

But if the skip \preXnotes@ is greater than 0 pt, it is used instead of \skip\footins for the first printed series in one page.

The \leftskip and \rightskip values are both zeroed here. Similarly, these skips are cancelled in the \vfootnote macros for the various types of notes. Strictly speaking, this is necessary only if you are using paragraphed footnotes, but we have put it here and in the other \vfootnote macros too so that the behavior of reledmac in this respect is general across all footnote types. What this means is that any \leftskip and \rightskip you specify applies to the main text, but not the footnotes. The footnotes continue to be of width \hsize.

```
2308 \newcommand*{\normalfootstart}[1]{%
2309  %
```

The first series of notes printed in a page can have a specific skip before it. In order to insert this specific skip without overlap the bottom margin of the page, Maïeul Rouquette have defined an algorithm explained in XVIII p. 184. Here is part of this algorithm, when the block of notes are ready to be printed.

```
2310 \ifdimequal{0pt}{\preXnotes@}{%
2311   %
2312   \iftoggle{\preXnotes@}{%
2313     \togglefalse{\preXnotes@}%
2314     \skip\csname #1footins\endcsname=%
2315     \dimexpr\csuse{\preXnotes@}+\csuse{\Xafterrule@#1}\relax%
2316   }%
2317   {}%
2318 }%
2319 \vskip\skip\csname #1footins\endcsname%
2320 %
```

And now, the problem of left and right skip for notes. Especially when using one feature of reledpar which allows to have the footnotes horizontal size as the size of columns printed by \Columns. Read XV p. 182 for the general description of the problem.

```
2321 \leftskip0pt \rightskip0pt
2322 \ifl@dpairing \else%
2323   \hsize=\old@hsize%
2324 \fi%
2325 \setXnoteswidthliketwocolumns@{\#1}%
2326 \setXnotespositionliketwocolumns@{\#1}%
2327 %
```

And now, print the footnote's rule to finish the footnote's introduction.

```

2328   \print@Xfootnoterule{#1}%
2329   \noindent\leavevmode}
2330 %

```

\normalfootgroup *\normalfootgroup* is a standard footnote-grouping macro: it sends the contents of the footnote-insert box to the output page without alteration.

```

2331 \newcommand*{\normalfootgroup}[1]{%
2332   {\csuse{Xnotefontsize@#1}\noindent\csuse{Xtxtbeforenotes@#1}}%

```

XII.6.3 Paragraphed footnotes

The paragraphed-footnote option reformats all the footnotes of one series for a page into a single paragraph; this is especially appropriate when the notes are numerous and brief. The code is based on *The TeXbook*, pp. 398–400, with alterations for our environment.

This algorithm uses a considerable amount of save-stack space: a \TeX of ordinary size may not be able to handle more than about 100 notes of this kind on a page.

\Xarrangement@paragraph The `\Xarrangement@paragraph` macro sets up everything for one series of the footnotes so that they will be paragraphed; it takes the series letter as argument. We include the setting of `\count\footins` to 1000 for the footnote series just in case user is switching to paragraphed footnotes after having columnar ones, since they change this value (see below).

The argument of `\Xarrangement@footparagraph` is the letter denoting the series of notes to be paragraphed.

```

2363 \newcommand*{\Xarrangement@paragraph}[1]{%
2364   \csgdef{series@display#1}{paragraph}
2365   \expandafter\newcount\csname #1prevpage@num\endcsname
2366   \expandafter\let\csname #1footstart\endcsname=\parafootstart
2367   \expandafter\let\csname v#1footnote\endcsname=\paravfootnote
2368   \expandafter\let\csname #1footfmt\endcsname=\parafootfmt
2369   \expandafter\let\csname #1footgroup\endcsname=\parafootgroup
2370   \count\csname #1footins\endcsname=1000
2371   \csxdef{default@#1footins}{1000}%Use this to confine the notes to one
2372   side only
2373   \dimen\csname #1footins\endcsname=\csuse{Xmaxhnotes@#1}
2374   \skip\csname #1footins\endcsname=\csuse{Xbeforenotes@#1}%
2375   \advance\skip\csname #1footins\endcsname by\csuse{Xafterrule@#1}%
2376   \para@footsetup{#1}
2377 %

```

And the extra setup for minipages.

```

2377 \ifnoledgroup@{\else
2378   \expandafter\let\csname mpv#1footnote\endcsname=\mpparavfootnote
2379   \expandafter\let\csname mp#1footgroup\endcsname=\mpparafootgroup
2380   \count\csname mp#1footins\endcsname=1000
2381   \dimen\csname mp#1footins\endcsname=\csuse{Xmaxhnotes@#1}
2382   \skip\csname mp#1footins\endcsname=\csuse{Xbeforenotes@#1}%
2383   \advance\skip\csname mp#1footins\endcsname by\csuse{Xafterrule@#1}%
2384 \fi
2385 }
2386 %

```

\footfudgefiddle For paragraphed footnotes \TeX has to estimate the amount of space required. If it underestimates this then the notes may get too long and run off the bottom of the text block. `\footfudgefiddle` can be increased from its default 64 (say to 70) to increase the estimate.

```

2387 \providecommand{\footfudgefiddle}{64}
2388 %

```

\para@footsetup `\footparagraph` calls the `\para@footsetup` macro to calculate a special fudge factor, which is the ratio of the `\baselineskip` to the `\hsize`. We assume that the proper

value of `\baselineskip` for the footnotes (normally 9 pt) has been set already. The argument of the macro is again the note series letter.

Peter Wilson thinks that `\columnwidth` should be used here for L^AT_EX not `\hsize`. Peter Wilson have also included `\footfudgefiddle`.

```

2389 \newcommand*{\para@footsetup}[1]{{\csuse{Xnotefontsize@#1}
2390   \setXnoteswidthliketwocolumns@{#1}%
2391   \dimen0=\baselineskip
2392   \multiply\dimen0 by 1024
2393   \divide \dimen0 by \columnwidth \multiply\dimen0 by \footfudgefiddle\relax
2394   \csxdef{#1footfudgefactor}{%
2395     \expandafter\strip@pt\dimen0 }}}
2396 %
2397 %

```

`\strip@pt` strip the characters pt from a dimen value.

`\parafootstart` `\parafootstart` is the same as `\normalfootstart`, but we give it again to ensure that `\rightskip` and `\leftskip` are zeroed (this needs to be done before `\para@footgroup` in the output routine). The size of paragraphed notes is calculated using a fudge factor which in turn is based on `\hsize`. So the paragraph of notes needs to be that wide.

The argument of the macro is again the note series letter.

```

2398 \newcommand*{\parafootstart}[1]{%
2399   \rightskip=0pt \leftskip=0pt \parindent=0pt
2400   \ifdim\rightskip=0pt{\preXnotes@}{%
2401     \if%
2402       \iftoggle{preXnotes@}{%
2403         \togglefalse{preXnotes@}%
2404         \skip\csname #1footins\endcsname=%
2405         \dimexpr\csuse{preXnotes@}+\csuse{Xafterrule@#1}\relax%
2406       }%
2407     }%
2408   }%
2409   \vskip\skip\csname #1footins\endcsname%
2410   \setXnoteswidthliketwocolumns@{#1}%
2411   \setXnotespositionliketwocolumns@{#1}%
2412   \print@Xfootnoterule{#1}%
2413   \noindent\leavevmode}
2414 %

```

`\paravfootnote` `\paravfootnote` is a version of the `\vfootnote` command that is used for paragraphed notes. It gets appended to the `\inserts@list` list by an outer-level footnote command like `\Afootnote`. The first argument is the note series letter; the second is the full text of the printed note itself, including line numbers, lemmata, and footnote text.

The initial model for this insertion is, of course, the `\insert\footins` definition in *The TeXbook*, p. 398. There, the footnotes are first collected up in hboxes, and these hboxes are later unpacked and stuck together into a paragraph.

However, Michael Downes has pointed out that because text in hboxes gets typeset in restricted horizontal mode, there are some undesirable side-effects if you later want to break such text across lines. In restricted horizontal mode, where TeX does not expect to have to break lines, it does not insert certain items like `\discretionary`s. If you later unbox these hboxes and stick them together, as the *TeXbook* macros do to make these footnotes, you lose the ability to hyphenate after an explicit hyphen. This can lead to overfull hboxes when you would not expect to find them, and to the uninitiated it might be very hard to see why the problem had arisen.²⁷

Wayne Sullivan pointed out to us another subtle problem that arises from the same cause: TeX also leaves the `\language` whatsit nodes out of the horizontal list.²⁸ So changes from one language to another will not invoke the proper hyphenation rules in such footnotes. Since critical editions often do deal with several languages, especially in a footnotes, we really ought to get this bit of code right.

To get around these problems, Wayne suggested emendations to the *TeXbook* versions of these macros which are broadly the same as those described by Michael: the central idea (also suggested by Donald Knuth in a letter to Michael) is to avoid collecting the text in an `\hbox` in the first place, but instead to collect it in a `\vbox` whose width is (virtually) infinite. The text is therefore typeset in unrestricted horizontal mode, as a paragraph consisting of a single long line. Later, there is an extra level of unboxing to be done: we have to unpack the `\vbox`, as well as the hboxes inside it, but that is not too hard. For details, we refer you to Michael's article, where the issues are clearly explained.²⁹ Michael's unboxing macro is called `\Xunvxh`: unbox, extract the last line, and unhbox it.

Doing things this way has an important consequence: as Michael pointed out, you really can't put an explicit line-break into a note built in a `\vbox` the way we are doing.³⁰ In other words, be very careful not to say `\break`, or `\penalty-10000`, or any equivalent inside your para-footnote. If you do, most of the note will probably disappear. You *are* allowed to make strong suggestions; in fact `\penalty-9999` will be quite okay. Just do not make the break mandatory. We have not applied any of Michael's solutions here, since we feel that the problem is exiguous, and `reledmac` is quite baroque enough already. If you think you are having this problem, look up Michael's solutions.

One more thing: we set `\leftskip` and `\rightskip` to zero. This has the effect of neutralizing any such skips which may apply to the main text (cf. XII.6.2 p. 143 above). We need to do this, since `\footfudgefactor` is calculated on the assumption that the notes are `\hsize` wide.

So, finally, here is the modified foot-paragraph code, which sets the footnote in vertical mode so that language and discretionary nodes are included.

```

2415 \newcommand*{\paravfootnote}[2]{%
2416   \insert\csname #1footins\endcsname
2417   \bgroup
2418     \csuse{Xnotefontsize@#1}

```

²⁷Michael Downes, 'Line Breaking in \unboxed Text', *TUGboat* 11 (1990), pp. 605–612.

²⁸See *The TeXbook*, p. 455 (editions after January 1990).

²⁹Wayne supplied his own macros to do this, but since they were almost identical to Michael's, Peter Wilson have used the latter's `\Xunvxh` macro since it is publicly documented.

³⁰'Line Breaking', p. 610.

```

2419 \footnoteskip
2420 \setbox0=\vbox{\hsize=\maxdimen
2421   \noindent\csuse{Xbhooknote@#1}%
2422   \csname #1footfmt\endcsname #2{#1}}%
2423 \setbox0=\hbox{\Xunvxh{0}{#1}}%
2424 \dp0=0pt
2425 \ht0=\csname #1footfudgefactor\endcsname\wd0
2426 %

```

Here we produce the contents of the footnote from box 0, and add a penalty of 0 between boxes in this insert.

```

2427 \if@RTL\noindent \leavevmode\fi\box0%
2428 \penalty0
2429 \egroup}
2430 %
2431 %

```

The final penalty of 0 was added here at Wayne's suggestion to avoid a weird page-breaking problem, which occurs on those occasions when TeX attempts to split foot paragraphs. After trying out such a split (see *The TeXbook*, p. 124), TeX inserts a penalty of -10000 here, which nearly always forces the break at the end of the whole footnote paragraph (since individual notes can't be split) even when this leads to an overfull vbox. The change above results in a penalty of 0 instead which allows, but does not force, such breaks. This penalty of 0 is later removed, after page breaks have been decided, by the \unpenalty macro in \makehboxofhboxes. So it does not affect how the footnote paragraphs are typeset (the notes still have a penalty of -10 between them, which is added by \parafootfmt).

\mpparavfootnote This version is for minipages.

```

2432 \newcommand*{\mpparavfootnote}[2]{%
2433   \global\setbox@\nameuse{mp#1footins}\vbox{%

2447 %

```

\Xunvxh Here is (modified) Michael's definition of \unvxh, used above. Michael's macro also takes care to remove some unwanted penalties and glue that TeX automatically attaches

to the end of paragraphs. When TeX finishes a paragraph, it throws away any remaining glue, and then tacks on the following items: a `\penalty` of 10000, a `\parfillskip` and a `\rightskip` (*The TeXbook*, pp. 99–100). `\unvvh` cancels these unwanted paragraph-final items using `\unskip` and `\unpenalty`.

```

2449 \newcommand*{\Xunvvh}[2]{%
250   \setbox0=\vbox{\unvbox#1%
251     \global\setbox1=\lastbox}%
252   \unhbox1
253   \unskip          % remove \rightskip,
254   \unskip          % remove \parfillskip,
255   \unpenalty       % remove \penalty of 10000,
256   \hskip\csuse{Xafternote@#2}} % but add the glue to go between the notes
257
258 %

```

\parafootfmt `\parafootfmt` is `\normalfootfmt` adapted to do the special stuff needed for paragraphed notes—leaving out the `\endgraf` at the end, sticking in special penalties and kern, and leaving out the `\footstrut`. The first argument is the line and page number information, the second is the lemma, the third is the text of the footnote, and the fourth is the series (optional, for backward compatibility).

```

2459 \newcommand*{\parafootfmt}[4]{%
250   \Xinsertparafootsep{#4}%
251   \Xledsetnormalparstuff{#4}%
252   \printlinefootnote{#1}{#4}%
253   {\nottoggle{Xlemmadisablefontselection@#4}{\select@lemm.getFont#1|#2}{#2}}%
254   \iftoggle{nosep@}{\hskip\csuse{Xinplaceoflemmaseparator@#4}}{\ifcsempy{%

256     {\hskip\csuse{Xinplaceoflemmaseparator@#4}}%
257     {\nobreak\hskip\csuse{Xbeforelemmaseparator@#4}\csuse{Xlemmaseparator@%
258     #4}\hskip\csuse{Xafterlemmaseparator@#4}}%
259   }%
260   #3\penalty-10 }
261 %

```

Note that in the above definition, the penalty of -10 encourages a line break between notes, so that notes have a slight tendency to begin on new lines. The `\Xinsertparafootsep` command is used to insert the `\Xparafootsep@series` between each note in the *same* page.

\parafootgroup This footgroup code is modelled on the macros in *The TeXbook*, p. 399. The only difference is the `\unpenalty` in `\makehboxofhboxes`, which is there to remove the penalty of 0 which was added to the end of each footnote by `\para@vfootnote`.

The call to `\Xnotefontsize@{s}` is to ensure that the correct `\baselineskip` for the footnotes is used. The argument is the note series letter.

```

XII.6.4 Columnar footnotes

Common tools

`\rigidbalance` We will now define macros for three-column notes and two-column notes. Both sets of macros will use `\rigidbalance`, which splits a box (#1) into a number (#2) of columns, each with a space (#3) between the top baseline and the top of the `\vbox`. The `\rigidbalance` macro is taken from *The TeXbook*, p. 397, with a slight change to the syntax of the arguments so that they do not depend on white space. Note also the extra unboxing in `\splitoff`, which allows the new `\vbox` to have its natural height as it goes into the alignment.

The `\line` macro has no relationship to the TeX `\line`. The `\line` equivalent is `\@@line`.

```

2536 \newcount\@k \newdimen\@h
2537 \newcommand*{\rigidbalance}[3]{\setbox0=\box#1 \@k=#2 \@h=#3
2538   \@@line{\splittopskip=\@h \vbadness=\@M \hfilneg

2567 }
2568 %

```

The `\footstart` and `\footnoterule` macros for these notes assume the normal values (XII.6.2 p. 143 above).

`\threecolfootsetup` The `\threecolfootsetup` macro calculates and sets some numbers for three-column footnotes.

We set the `\count` of the foot insert to 333. Each footnote can be thought of as contributing only one third of its height to the page, since the footnote insertion has been made as a long narrow column, which then gets trisected by the `\rigidbalance` routine (inside `\threecolfootgroup`). These new, shorter columns are saved in a box, and then that box is *put back* into the footnote insert, replacing the original collection of the footnotes. This new box is, therefore, only about a third of the height of the original one.

The `\dimen` value for this note series has to change in the inverse way: it needs to be three times the actual limit on the amount of space these notes are allowed to fill on the

page, because when \TeX is accumulating material for the page and checking that limit, it does not apply the $\backslash\count$ scaling.

```
2570 \newcommand*{\threecolfootsetup}[1]{%
2571   \count\csname #1footins\endcsname 333
2572   \csxdef{default@#1footins}{333}\%Use this to confine the notes to one
2573   side only
2574   \multiply\dimen\csname #1footins\endcsname \thr@@}
2575 %
```

\mpthreecolfootsetup The setup for minipages.

2577   \multiply\dimen\csname mp#1footins\endcsname \thr@@}
2578 %
2579 %
```

\threecolvfootnote $\backslash\threecolvfootnote$ is the $\backslash\vfootnote$ command for three-column notes. The call to $\backslash\Xnotefontsize@{s}$ ensures that the $\backslash\splittopskip$ and $\backslash\splitmaxdepth$ take their values from the right $\backslash\strutbox$: the one used in a footnotes. Note especially the importance of temporarily reducing the $\backslash\hsize$ to 0.3 of its normal value. This determines the widths of the individual columns. So if the normal $\backslash\hsize$ is, say, 10 cm, then each column will be $0.3 \times 10 = 3$ cm wide, leaving a gap of 1 cm spread equally between columns (i.e., .5 cm between each).

The arguments are #1 the note series letter and #1 the full text of the note (including numbers, lemma and text).

```
2580 \notbool{parapparatus@}{\newcommand*{\newcommand}{\threecolvfootnote}[2]{%
2581   \insert\csname #1footins\endcsname\bgroup

2603 %

```

\threecolfootgroup And here is the `footgroup` macro that is called within the output routine to regroup the notes into three columns. Once again, the call to `\Xnotefontsize@<s>` is there to ensure that it is the right `\splittopskip`—the one used in footnotes—which is used to provide the third argument for `\rigidbalance`. This third argument (`\@h`) is the topskip for the box containing the text of the footnotes, and does the job of making sure the top lines of the columns line up horizontally. In *The TeXbook*, p. 398, Donald Knuth suggests retrieving the ouput of `\rigidbalance`, putting it back into the insertion box, and then printing the box. Here, we just print the `\line` which comes out of `\rigidbalance` directly, without any re-boxing.

XII.7 Critical notes presentation

Here, we define some commons macro which are used in order to print a critical notes, that is a note with 1) line number 2) lemma 3) lemma separator 4) text associated to the lemma.

XII.7.1 Font tools

`\endashchar` The fonts that are used for printing notes might not have the character mapping we expect: for example, the Computer Modern font that contains old-style numerals does not contain an en-dash or square brackets, and its period and comma are in odd locations.
`\fullstop` To allow use of the standard footnote macros with such fonts, we use the following
`\rbracket` macros for certain characters.

The `\endashchar` macro is simply an en-dash from the normal font and is immune to changes in the surrounding font. The same goes for the full stop. These two are used in `\printlines`. The right bracket macro is the same again; it crops up in `\normalfootfmt` and the other footnote macros for controlling the format of the footnotes.

With `polyglossia`, each critical note has a `\footnote@lang` which shows the language of the lemma, and which can be used to switch the bracket from right to left.

```

2715 \def\endashchar{\textnormal{--}}
2716 \newcommand*{\fullstop}{\textnormal{.}}
2717 \newcommand*{\rbracket}{\textnormal{%
2718   \csuse{text}\csuse{footnote@lang}\{%
2719     \ifluatex%
2720       \ifedefstring{\footnote@luatextdir}{TRT}{\thinspace[]\thinspace}%
2721     \else%
2722       \thinspace]%
2723     \fi}%
2724   }%
2725 }
2726
2727 %

```

XII.7.2 Pstart number in footnote

`\printpstart` The `\printpstart` macro prints the pstart number for a note.

```

2728 \newcommand{\printpstart}[0]{%
2729   \ifboolexpr{bool{l@dpairing} or bool{l@dprintingpages} or bool{%
2730     l@dprintingcolumns}}{%

2732       \thePstartR%
2733     \else%
2734       \thePstartL%
2735     \fi%
2736     \thePstart%
2737   }%
2738 }
2739 %

```

XII.7.3 Line number printing

`\printlinefootnote` The `\printlinefootnote` macro is called in each `\<type>footfmt` command. It controls whether the line number is printed or not, according to the series options. Its first argument is the information about lines; its second is the series of the footnote. The printing of the line number is shared in `\printlinefootnotenumbers`.

```

2740 \newcommand{\printlinefootnote}[2]{%

```

If we have decided to print the line number in a specific notes, the `\printlines` macro prints the line numbers for a note—which, in the general case, is a rather complicated task. The seven parameters of the argument are the line numbers as stored in `\l@d@nums`, in the form described on V.9 p. 81: the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma.

`edmac`' creator have defined six boolean in order to know which component of line number description we have to print:

- `\ifl@d@pnum` for page numbers;
- `\ifl@d@ssub` for starting sub-line;
- `\ifl@d@elin` for ending line;
- `\ifl@d@esl` for ending sub-line; and
- `\ifl@d@dash` for the dash between the starting and ending groups.

There is no boolean for the line number because it is always printed.

Maïeul Rouquette has added `\ifl@d@Xtwolines` and `\ifl@d@Xmorethan twolines` to print a symbol which stands for “and subsequent” when there are two, three or more lines.

```

\ifl@d@pnum40 \newif\ifl@d@pnum
\ifl@d@ssub41 \newif\ifl@d@ssub
\ifl@d@elin42 \newif\ifl@d@elin
\ifl@d@esl43 \newif\ifl@d@esl

\ifl@d@Xtwolines2845 \newif\ifl@d@Xtwolines%
\ifl@d@Xmorethan twolines2846 \newif\ifl@d@Xmorethan twolines%
2847 %

\l@dparsefootspec \l@dparsefootspec{\langle spec\rangle}{\langle lemma\rangle}{\langle text\rangle} parses a footnote specification. \langle lemma
```

`\l@dparsefootspec` and `\l@dparsefootspec` are the lemma and text respectively. `\langle spec` is the line and page number and lemma font specifier in `\l@d@nums` style format. The real work is done by `\l@dp@rsefootspec` which defines macros holding the numeric values. Just a reminder of the arguments:

```

\l@dparsedstartpage \l@dparsestartpage
\l@dparsedstartline \l@dparsestartline
\l@dparsedstartsub \l@dparsestartsub
\l@dparsedendpage \l@printlines #1 | #2 | #3 | #4 | #5 | #6 | #7
\l@dparsedendline \l@printlines start-page | line | subline | end-page | line | subline | font
\l@dparsedendsub 
```

```

2848 \newcommand*{\l@dp@rsefootspec}[3]{\l@dp@rsefootspec#1|}

```

`\setistwofollowinglines` The `\ifistwofollowinglines` boolean, used by the `\Xtwolines` and related setting, is set to true by `\setistwofollowinglines`. This command takes the following arguments:

- #1 First page number.
- #2 First line number.
- #3 Last page number.
- #4 Last line number.

If $#3 - #2 = 1$, then that means the two lines are subsequent, and consequently `\ifistwofollowinglines` is set to true. However, if we use lineation by page, two given lines can be subsequent if:

- The first line number is equal to the last line number of the first page.
- The last line number is equal to 1.
- $#3 - #1$ is equal to 1.

One subtlety left here is when to print a period between numbers. But the only instance in which this is tricky is for the ending sub-line number: it could come after the starting sub-line number (in which case we want only the dash) or after an ending line number (in which case we need to insert a period). So, first, print the start line number.

XIII Familiar footnotes

XIII.1 Adjacent footnotes

The original `edmac` provided users with five series of critical footnotes (`\Afootnote` `\Bfootnote` `\Cfootnote` `\Dfootnote` `\Efootnote`), and `LATEX` provides a single numbered footnote. The `reledmac` package uses the `edmac` mechanism to provide six series of numbered footnotes.

First, though, the `footmisc` package has an option whereby two or more consecutive `\footnotes` have their marks separated by commas. This seemed to Peter Wilson such a useful ability that it was provided automatically by `eledmac`.

Maïeul Rouquette has maintained this feature in `reledmac`, despite he thought that is not directly in relationship with the aim of `reledmac`.

`\multiplefootnotemarker` These macros may have been defined by the `memoir` class, are provided by the `footmisc` package and perhaps by other footnote packages. That is why we use `\providecommand` and not `\newcommand`.

```

2993 \providecommand*\multiplefootnotemarker{3sp}
2994 \providecommand*\multfootsep{\textsuperscript{\normalfont,}}
2995 %
2996 %

```

`\m@mmf@prepare` A pair of self-cancelling kerns. This may have been defined in the `memoir` class.

```

2997 \providecommand*\m@mmf@prepare{%
2998 \kern-\multiplefootnotemarker
2999 \kern\multiplefootnotemarker\relax}
3000 %

```

`\m@mmf@check` This may have been defined in the `memoir` class. If it recognises the last kern as `\multiplefootnotemarker` it typesets `\multfootsep`.

```

3001 \providecommand*\m@mmf@check{%
3002 \ifdim\lastkern=\multiplefootnotemarker\relax

```

```

3003   \edef\x@sf{\the\spacefactor}%
3004   \unkern
3005   \multfootsep
3006   \spacefactor\x@sf\relax
3007   \fi}
3008 %
3009 %

```

We have to modify `\@footnotetext` and `\@footnotemark`. However, if `memoir` is used the modifications have already been made.

```

3010 \ifclassloaded{memoir}{}{%
3011 %

```

`\@footnotetext` Add `\m@mmf@prepare` at the end of `\@footnotetext`.

```

3012 \apptocmd{\@footnotetext}{\m@mmf@prepare}{}{%
3013 %

```

`\@footnotemark` Modify `\@footnotemark` to cater for adjacent `\footnotes`.

```

3014
3015 \patchcmd{\@footnotemark}
3016   {\nobreak}
3017   {\m@mmf@check
3018   \nobreak
3019   }
3020   {}{%
3021 \patchcmd{\@footnotemark}
3022   {\@makefnmark}
3023   {\@makefnmark
3024   \m@mmf@prepare
3025   }
3026   {}{%
3027 %

```

Finished the modifications for the non-memoir case.

```

3028 }
3029 %
3030 %

```

XIII.2 Regular footnotes for numbered texts

`\l@dold@footnotetext` In order to enable the regular `\footnotes` in numbered text we have to play around `\@footnotetext` with its `\@footnotetext`, using different forms for when in numbered or regular text.

```
3031 \pretocmd{\@footnotetext}{%
3032   \ifnumberedpar@
3033     \edtext{}{\l@dbfnote{#1}}%
3034   \else
3035     \{}{%
3036   \apptocmd{\@footnotetext}{\fi}{}{%
3037   }
```

`\l@dbfnote` \l@dbfnote adds the footnote to the insert list, and `\vl@dbfnote` calls the original
`\vl@dbfnote` \l@dbfnote.

```
3038 \newcommand{\l@dbfnote}[1]{%
3039   \ifnumberedpar@
3040     \gdef\@tag{\#1\relax}%
3041     \ifuledRcol%
3042       \xright@appenditem{\noexpand\v{l@dbfnote}{\expandonce{\@tag}}}{%
3043         @thefnmark}}%
3044         \to\inserts@listR
3045         \global\advance\insert@countR \cne%
3046     \else%
3047       \xright@appenditem{\noexpand\v{l@dbfnote}{\expandonce{\@tag}}}{%
3048         @thefnmark}}%
3049         \to\inserts@list
3050         \global\advance\insert@count \cne%
3051     \fi
3052   \fi\ignorespaces}
3053 \newcommand{\v{l@dbfnote}[2]{%
3054   \def\@thefnmark{\#2}%
3055   \footnotetext{\#1}%
3056 }%
3057 %
```

XIII.3 Footnote formats

Some of the code for the various formats is remarkably similar to that in section ??.

The following macros generally set things up for the ‘standard’ footnote format.

`\prebodyfootmark` Two convenience macros for use by `\...@footnotemark...` macros.

```
\postbodyfootmark      3058 \newcommand*\{\prebodyfootmark\}{%
                           3059   \leavevmode
                           3060   \ifhmode
                           3061     \edef\@x@sf{\the\spacefactor}%
                           3062     \m@mmf@check
                           3063     \nobreak
                           3064   \fi}
                           3065 \newcommand*\{\postbodyfootmark\}{%
```

```

3066     \m@mmf@prepare
3067     \ifhmode\spacefactor\@x@sf\fi\relax
3068
3069 %

```

XIII.4 Footnote arrangement

XIII.4.1 User level macro

`\arrangementX` `\arrangementX[⟨s⟩]{⟨arrangement⟩}` command calls, for each series, a specific command which set many counters and commands in order to define specific arrangement.

```

3070 \newcommandx{\arrangementX}[2][1,usedefault]{%
3071   \def\do##1{%
3072     \csname arrangementX@\#2\endcsname{##1}%
3073   }%
3074   \ifstrempty{##1}{%
3075     {%
3076       \dolistloop{\@series}%
3077     }%
3078   }{%
3079     \docsVlist{##1}%
3080   }%
3081 }%
3082 %

```

XIII.4.2 Normal footnotes

`\normal@footnotemarkX` `\normal@footnotemarkX{⟨series⟩}` sets up the typesetting of the marker at the point where the footnote is called for.

```

3083 \newcommand*{\normal@footnotemarkX}[1]{%
3084   \prebodyfootmark
3085   \nameuse{bodyfootmark#1}%
3086   \postbodyfootmark
3087
3088 %

```

`\normalbodyfootmarkX` The `\normalbodyfootmarkX{⟨series⟩}` really typesets the in-text marker. The style is the normal superscript.

```

3089 \newcommand*{\normalbodyfootmarkX}[1]{%
3090   \hbox{\textsuperscript{\normalfont\nameuse{@thefnmark#1}}}}
3091 %

```

`\normalvfootnoteX` `\normalvfootnoteX{⟨series⟩}{⟨text⟩}` does the `\insert` for the `⟨series⟩` and calls the series' `\footfmt...` to format the `⟨text⟩`.

```

3092 \notbool{parapparatus@}{\newcommand*{\newcommand}{\normalvfootnoteX}[2]{%

XIV Code common to both critical and familiar footnote in normal arrangement

`\par` should always be redefined to `\endgraf` within the format macro (this is what `\normal@pars` does), to override tricky material in the main text to get the lines numbered automatically (as set up by `\autopar`, for example).

In the case of footnote arranged in a “normal” way, we also must set some setting for paragraph indent and text direction when using `LuaETEX`.

That why we have defined `\ledsetnormalparstuff@common` in order to make this setting for both familiar and critical notes. This command is called by command to make specific setting to critical or familiar footnote.

```

\ledsetnormalparstuff@common69 \newcommand*{\ledsetnormalparstuff@common}{%
  \Xledsetnormalparstuff70
  \ledsetnormalparstuffX71

XV Footnotes' width for two columns

We define here some commands which make sense only with `reledpar`, but must be called when defining notes parameters. These commands change the width of block notes to allow them to have the same size than two parallel columns.

`\old@hsize` These two commands are called at the beginning of critical or familiar notes groups.
`\setXnoteswidthliketwocolumns@` They set, if the option is enabled, the `\hsize`. They are also called at the on the setup
`\setnoteswidthliketwocolumnsX@` for paragraphed notes.

```

  3588 \newdimen\old@hsize%
  3589 \AtBeginDocument{\old@hsize=\hsize}
  3590
  3591 \newcommand{\setXnoteswidthliketwocolumns@}[1]{%

3651 }%
3652
3653 %

```

XVIII Specific skip for first series of footnotes

XVIII.0.1 Overview

`\Xbeforenotes` inserts a specific skip for the first series of notes in a page. As we can't know in advance which series will be the first, we call `\prepare@preXnotes` before inserting any critical notes, in order to prevent page number overlapping.

1. If it is the first note of the current page, it changes the footnote skip for the series to the value specified to `\Xbeforenotes`. It also keeps the series of the note as the first one of the current page.
2. If it is not the first note of the current page:
 - If the current series is printed after the series kept as the first of the current page, then nothing happens.

- If the current series is printed before the series kept as the first of the current page, then it changes the footnote skip of the current series to the value normally used by the series which was marked as the first of the page. It also keeps the current series as the new first one of the current page.

For example, suppose the series order is A,B. We call first a \Bfootnote and a \Afootnote. The only skips used are, finally, the skip specific to the first series of the page, and the skip for the B series. If we have not called \Afootnote, the only skip used is the skip specific to the first series of the page.

That is perfect.

The series skip and the first series of the current page are reset before the footnotes are printed. Then, the footstart macros manage the problem of the first series of the page.

After the rule, the space which is defined by \Xafterrule does not depend on whether the series is the first one of the page or not. So we use its normal value for each series.

And now, implementation !

XVIII.0.2 User level command

\preXnotes@ If user redefines \preXnotes@, via \preXnotes to a value greater than 0 pt, this skip
\preXnotes will be added before first series notes instead of the notes skip.

```
3654 \newtoggle{\preXnotes@}
3655 \toggletrue{\preXnotes@}
3656 \newcommand{\preXnotes@}{0pt}
3657 \newcommand*{\preXnotes}[1]{\renewcommand{\preXnotes@}{#1}}
3658 %
```

The same, but for familiar footnotes.

```

XIX Endnotes

First, check the `noend` option.

```

3708 \ifbool{noend@}{}{%
3709   % Used instead of \ifnoend@ to prevent expansion problem
}
```

\l@dend@open and \l@dend@close are the macros that are used to open and close the endnote file. Note that all our writing to this file is \immediate: all page and line numbers for the endnotes are generated by the same mechanism we use for the footnotes, so that there is no need to defer any writing to catch information from the output routine. The argument of these two command is the series letter.

```

3710 \newcommand{\l@dend@open}[1]{%

3732 }%
3733 %

```

\endprint The \endprint here is nearly identical in its functioning to \normalfootfmt.
\l@d@section The endnote file also contains \l@d@section commands, which supply the section numbers from the main text; standard reledmac does nothing with this information, but it is there if you want to write custom macros to do something with it. Arguments are:

- #1 Line numbers and font selection.
- #2 Lemma.
- #3 Note content.
- #4 Series.

- #5 Optional argument of \Xendnote.

```

\setprintendlines The `\printendlines` macro is similar to `\printlines` but is for printing endnotes rather than footnotes.

The principal difference between foot- and endnotes is that footnotes are printed on the page where they are specified but endnotes are printed at a different point in the document. We need an indication of the source of an endnote; `\setprintendlines` provides this by always printing the page number. The coding is slightly simpler than `\setprintlines`.

First of all, we print the second page number only if the ending page number is different from the starting page number.

```

3796 \newcommand*{\setprintendlines}[6]{%

```

The only subtlety left here is when to print a period between numbers. But the only instance in which this is tricky is for the ending sub-line number: it could be coming after the starting sub-line number (in which case we want only the dash) or after an ending line number (in which case we need to insert a period).

So, first, print the start lines.

```

XX.5 The endnotes

Endnotes are commands like `\Xendnote`, where X is a series letter. First, we check for the `noend` options.

```

4107     \unless\ifnoend@
4108 %

```

XX.5.1 The auxiliary file

`\l@d@Xend` Endnotes of all varieties are saved up in a file, one by series, typically named $\langle jobname \rangle.Xend$.
`\ifl@end@X` is the output stream number for this file, and `\ifl@end@X` is a flag that is
`\l@end@Xtrue` true when the file is open.
`\l@end@Xfalse`

```

4109     \expandafter\newwrite\csname l@d@#1end\endcsname%
4110     \expandafter\newif\csname ifl@end@#1\endcsname%
4111 %

```

XX.5.2 The main macro

The `\Xendnote` macro functions to write one endnote to the `.Xend` file. We change `\newlinechar` so that in the file every space becomes the start of a new line; this generally ensures that a long note does not exceed restrictions on the length of lines in files.

```

4112

4131     %

```

\Xendnote commands called \Xend commands on to the endnote file; these are analogous to the various footfmt commands above, and they take the same arguments. When we process this file, we want to pick out the notes of one series and ignore all the rest. To do that, we equate the end command for the series we want to \endprint, and leave the rest equated to \@gobblefive, which just skips over its five arguments.

```

4194   \ifdefempty{\@series}{%
4195     {\xdef\@firstseries{}}%
4196     {\StrChar{\@series}{1}[\@firstseries]}%
4197   }%
4198   %

```

XXI.3 Series setting

XXI.3.1 General way of working

The setting's command (like `\numberonlyfirstinline`), also called “hooks” can be divided in two categories: those which require a string values and those which require a boolean value. The first category includes those which require a length value, because we store the length's expression send by user and we evaluate it only in the commands which requires to know the setting. The second category require boolean value only when it is set to FALSE. Otherwise, we understand the insinuated value is TRUE.

For each “hook” command, we store the value in commands (first category) or a etoolbox's toggle (second category) which names are in the form `\<hook>@\<series>`. For example when calling `\twolines{<sq>}`, we store `sq.` in commands `\twolines@A`, `\twolines@B`, `\twolines@C...`for each series defined for use with `reledmac`, or, if the `[<series>]` optional argument was send, for each series of this argument.

These values are tested in some specific places, scattered in all the code, depending of their effects. The default values are defined by the `\newseries@` command.

In order to prevent code duplication, we have created some generic commands. Some of them change the value of any hook send as argument. Some other, getting a hook name, generate the user level commands.

XXI.3.2 Tools to set options

`\settoggle@series` `\settoggle@series{<series>}{<toggle>}{<value>}` is a generic command to switch toggles for some series. The arguments are:

- #1 (mandatory): the series for which the hooks should be set. If empty, all the series will be affected.
- #2 (mandatory): the name of the hook.
- #3 (mandatory): the new value of toggle (true or false).
- #4 (optional): if equal to `reload`, reload the footnote setting (call again `\Xarrangement` or `\arrangementX` or ... depending of the footnote display).
- #5 (optional): if not empty, and if #1 is empty, change the hook setting for pseudo-series, as `appref`.

```

4199 \newcommandx{\settoggle@series}[5][4,5,usedefault]{%
4200   \def\do##1{%
4201     \global\settoggle{#2@##1}{#3}%
4202     \ifstrequal{#4}{reload}%
4203       {%
4204         \csuse{Xarrangement@\csuse{series@display##1}}{##1}%
4205         \csuse{arrangementX@\csuse{series@displayX##1}}{##1}%
4206       }%
4207       {}%
4208     }%
4209     \ifstrempty{#1}{%
4210       \dolistloop{\@series}%
4211       \ifstrempty{#5}{%
4212         \docsclist{#5}%
4213       }%
4214       {}%
4215       {}%
4216       \docsclist{#1}%
4217     }%
4218   }%
4219 %

```

`\setcommand@series` `\setcommand@series{<series>}{<command>}{<value>}` is a generic command to store hook's value into commands specific to some series. The arguments are:

- #1 (mandatory): the series for which the hooks should be set. If empty, all the series will be affected.
- #2 (mandatory): the name of the hook.
- #3 (mandatory): the new value of the hook/command.
- #4 (optional): if equal to `reload`, reload the footnote setting (call `\footnormal` or `\footparagraph` or ... depending of the footnote display).
- #5 (optional): if not empty, and if #1 is empty, change the hook setting for pseudo-series, as `appref`.

```

4220 \newcommandx{\setcommand@series}[5][4,5,usedefault]{%
4221   \def\do##1{%
4222     \csgdef{##2##1}{##3}%
4223     \ifstrelqual{##4}{reload}{%

4230         \docslist{##5}%
4231       }%
4232     }%
4233     {%
4234       \docslist{##1}%
4235     }%
4236   }%
4237 %

```

XXI.3.3 Tools to generate options commands

`\newhookcommand@series` `\newhookcommand@series\command` `names` is a generic command to add new commands for hooks, like `\Xhsizetwocol`. The first argument is the name of the hook, the second a comma separated list of pseudo-series where the hook can be used, like `appref` in the case of `\Xtwolines`. The second argument is also used to create commands named `\<hookname>\<pseudoseries>`, like `\Xtwolinesappref`.

```

4238 \newcommandx{\newhookcommand@series}[2][2,usedefault]{%
4239   \global\expandafter\newcommand\expandafter*\csname #1\endcsname[2][]{%
4240     \setcommand@series{##1}{##1}{##2}[] [##2]%
4241   }%
4242   \ifstrempty{##2}{%
4243     \def\do##1{%
4244       \global\expandafter\newcommand\expandafter*\csname #1##1\endcsname
4245       [1]{%
4246         \csuse{##1}[##1]{{##1}}%
4247       }%
4248     }%
4249   }%

```

```

4247   }%
4248   \docsvlist{#2}%
4249 }%
4250 }
4251 %

```

\newhooktoggle@series \newhooktoggle@series\command names is a generic command to add new commands for a new toggle hook, like \Xnumberonlyfirstininline. The second argument is also used to create commands named \<hookname>\<pseudoseries>, like \Xtwolinesbutnotmoreappref.

```

4252 \newcommandx{\newhooktoggle@series}[2][2,usedefault]{%
4253   \global\expandafter\newcommandx\expandafter*\csname #1\endcsname[2][1,2={%
4254     true},usedefault]{%
4255     \settoggle@series{##1}{#1}{##2}[] [#2]%
4256   }%
4257   \ifstrempty{#2}{}{%
4258     \def\do##1{%
4259       \global\expandafter\newcommand\expandafter*\csname #1##1\endcsname{%
4260         \csuse{#1}{##1}%
4261       }%
4262     \docsvlist{#2}%
4263   }%
4264 }
4265 %

```

\newhooktoggle@series@reload \newhookcommand@toggle@reload does the same thing as \newhooktoggle@series but the commands created by this macro also reload the series arrangement.

```

4266 \newcommand{\newhooktoggle@series@reload}[1]{%
4267   \global\expandafter\newcommandx\expandafter*\csname #1\endcsname[2][1,2={%
4268     true},usedefault]{%
4269     \settoggle@series{##1}{#1}{##2}[reload]%
4270   }%
4271 %

```

\newhookcommand@series@reload \newhookcommand@series@reload does the same thing as \newhookcommand@series but the commands created by this macro also reload the series' arrangement.

```

4272 \newcommand{\newhookcommand@series@reload}[1]{%
4273   \global\expandafter\newcommand\expandafter*\csname #1\endcsname[2][]{%
4274     \setcommand@series{##1}{#1}{##2}[reload]%
4275   }%
4276 }
4277 %

```

XXI.3.4 Options for critical notes

Before generating the commands that are used to set the critical notes, such as `\Xnumberonlyfirstinline`, `\Xlemmaseparator` and the like, we check the `nocritical` option.

```

4278 \unless\ifnocritical@
4279   \newhooktoggle@series{Xparindent}

XXII Output routine

Now we begin the output routine and associated things.

XXII.0.1 Page number management

\pageno \pageno is a page number, starting at 1, and \advancepageno increments the number.

```

4389 \countdef\pageno=0 \pageno=1
4390 \newcommand*{\advancepageno}{\ifnum\pageno<\z@ \global\advance\pageno\m@ne
4391   \else\global\advance\pageno\@ne\fi}
4392 %
4393 %

```

XXII.0.2 Extra footnotes output

With luck we might only have to change \@makecol and \@reinserts of the L^AT_EX's kernel. Since `reledmac`, we use `etoolbox`'s patching commands instead of overriding. It should provides better compatibility with other package which modify these commands

\doxtrafeet \doxtrafeet is the code extending \@makecol to cater for the extra `reledmac` feet. We have two categories of extra footnotes. By default, we order the footnote inserts so that the regular footnotes of L^AT_EX are first, then familiar familiar footnotes and finally the critical footnotes.

```

4394 \newcommand*{\l@ddoxtrafeet}{%

XXIII Cross referencing

You can mark a place in the text using a command of the form `\edlabel{<foo>}`, and later refer to it using the label `<foo>` by saying `\edpageref{<foo>}`, or `\lineref{<foo>}` or `\sublineref{<foo>}` or `\pstartref`. These reference commands will produce, respectively, the page, line sub-line and pstart on which the `\edlabel{<foo>}` command occurred.

The reference macros warn you if a reference is made to an undefined label. If `{<foo>}` has been used as a label before, the `\edlabel{<foo>}` command will issue a complaint; subsequent `\edpageref` and `\edlineref` commands will refer to the latest occurrence of `\edlabel{<foo>}`.

\labelref@list Set up a new list, `\labelref@list`, to hold the page, line and sub-line numbers for each label.

```
4571 \list@create{\labelref@list}
4572 %
```

\zz@@@ A convenience macro to zero two labeling counters in one go.

```
4573 \newcommand*{\zz@@@}{\z@ \z@} % set two counters to zero in one go
4574 %
4575 %
```

\edlabel The `\edlabel` command first writes a `\@lab` macro to the `\linenum@out` file. It then checks to see that the `\labelref@list` actually has something in it (if not, it creates a dummy entry), and pops the next value for the current label, storing it in `\label@refs`. Finally it defines the label to be `\empty` so that any future check will turn up the fact that it has been used.³¹

This version of the original edmac `\label` uses `\@bsphack` and `\@esphack` to eliminate extra space problems and also use the L^AT_EX write methods for the `.aux` file.

Jesse Billett³² found that the original code could be off by several pages. This version, hopefully cures that, and also allows for non-arabic page numbering.

```
4576 \newcommand*{\edlabel}[1]{%
4577   \ifl@dpairing\ifautopar%
4578     \strut%
4579   \fi\fi%
4580   \@bsphack%
4581   \ifledRcol%
```

³¹The remaining macros in this section were kindly revised by Wayne Sullivan, who substantially improved their efficiency and flexibility.

³²(jdb43@cam.ac.uk) via the `ctt` thread ‘ledmac cross referencing’, 25 August 2003.

\l@dmakelabels The `\l@dmakelabels` macro gets executed when the labels file is read. For each label it defines a macro, whose name is made up partly from the label you supplied, that contains the page, line and sub-line numbers. But first it checks to see whether the label has already been used (and complains if it has).

The initial use of `\newcommand` is to catch if `\l@dmakelabels` has been previously defined (by a class or package).

#1 page number, #2 line number, #3 sub-line number, #4 pstart number, #5 label.

```

4641 %

```

\@lab The `\@lab` command, which appears in the `\linenum@out` file, appends the current values of page, line and sub-line to the `\labelref@list`. These values are defined by the earlier `\@page`, `\@nl`, and the `\sub@on` and `\sub@off` commands appearing in the `\linenum@out` file.

LATEX uses the page counter for page numbers. However, it appears that this is not the right place to grab the page number. That task is now done in the `\edlabel` macro. This version of `\@lab` appends just the current line and sub-line numbers to `\labelref@list`.

\edpageref If the specified label exists, `\edpageref` gives its page number.

\xpageref For this reference command, as for the other two, a special version with prefix x is provided for use in places where the command is to be scanned as a number, as in `\linenum`. These special versions have two limitations: they do not print error messages if the reference is unknown, and they can't appear as the first label or reference command in the file; you must ensure that a `\edlabel` or a normal reference command appears first, or these x-commands will always return zeros.

TeX already defines a `\pageref`, so changing the name to `\edpageref`.

```

4696 \newcommand*{\edpageref}[1]{\l@dref@undefined{\#1}\wrap@edcrossref{\#1}{\

4710 \newcommand*{\xpstarteref}[1]{\l@getref@num{4}{#1}}
4711 %

```

The next three macros are used by the referencing commands above, and do the job of extracting the right numbers from the label macro that contains the page, line, and sub-line number.

\l@eref@undefined The \l@eref@undefined macro is called when you refer to a label with the normal referencing macros. Its argument is a label, and it just checks that the label has been defined.

```

4712 \newcommand*{\l@eref@undefined}[1]{%
4713   \expandafter\ifx\csname the@label#1\endcsname\relax
4714     \l@warn@RefUndefined{#1}%
4715   \fi}
4716 %
4717 %

```

\l@getref@num Next, \l@getref@num fetches the number we want. It has two arguments: the first is simply a digit, specifying whether to fetch a page (1), line (2), sub-line (3) or (4) pstart number. (This switching is done by calling \l@label@parse.) The second argument is the label-macro, which because of the \l@lab macro above is defined to be a string of the type 123|456|789.

```

4718 \newcommand*{\l@getref@num}[2]{%
4719   \expandafter
4720   \ifx\csname the@label#2\endcsname \relax
4721     000%
4722   \else

4726 %
4727 %

```

\l@label@parse Notice that we slipped another | delimiter into the penultimate line of \l@dgetref@num, to keep the ‘switch-number’ separate from the reference numbers. This | is used as another parameter delimiter by \l@label@parse, which extracts the appropriate number from its first arguments. The |-delimited arguments consist of the expanded label-macro (three reference numbers), followed by the switch-number (1, 2, 3 or 4) which defines which of the earlier three numbers to pick out. (It was earlier given as the first argument of \l@dgetref@num.)

```

4735   \fi}
4736 %

```

\xxref The \xxref command takes two arguments, both of which are labels, e.g., \xxref{mouse}{elephant}. It first does some checking to make sure that the labels do exist (if one does not, those numbers are set to zero). Then it calls \linenum and sets the beginning page, line, and sub-line numbers to those of the place where \label{mouse} was placed, and the ending numbers to those at {elephant}. The point of this is to be able to manufacture footnote line references to passages which can not be specified in the normal way as the first argument to \edtext for one reason or another. Using \xxref in the second argument of \edtext lets you set things up at least semi-automatically.

```

4737 \newcommand*\xxref[2]{%

\appref prints a crossref to some lines of the apparatus defined by \applabel. It prints the lines as they should be printed in the apparatus.
 If \apprefprefixsingle is not empty, it prints it before the line number. If \apprefprefixmore is not empty, it prints it before the line numbers when the first line is not the same as the last line. \apprefwithpage prints a crossref to some lines of the apparatus defined by \applabel. It always prints the page number, as it should be printed in the end notes. The \Xtwolinesappref and \Xmorethanwolinesappref are similar to the footnote hooks and \Xtwolines \Xmorethanwolines.

So, first declare the default value of the hooks for the pseudo-series appref. Also declare the internal toggle which are switch by reledmac.

```

4760 \xdef\Xtwolines@appref{}%
4761 \xdef\Xmorethanwolines@appref{}%
4762 \newtoggle{Xtwolinesbutnotmore@appref}%
4763 \newtoggle{Xtwolinesonlyinsamepage@appref}%
4764 %

4816 }%

```

\edmakelabel Sometimes the `\edlabel` command cannot be used to specify exactly the page and line desired; you can use the `\edmakelabel` macro make your own label. For example, if you say `\edmakelabel{elephant}{10|25|0}` you will have created a new label, and a later call to `\edpageref{elephant}` would print ‘10’ and `\lineref{elephant}` would print ‘25’. The sub-line number here is zero. `\edmakelabel` takes a label, followed by a page and a line number(s) as arguments. L^AT_EX defines a `\makelabel` macro which is used in lists. Peter Wilson has changed the name to `\edmakelabel`.

```

4817 \newcommand*{\edmakelabel}[2]{\expandafter\xdef\csname the@label#1\endcsname{#2}}

```

```
4818 %
4819 %
```

(If you are only going to refer to such a label using `\xxref`, then you can omit entries in the same way as with `\linenum` (see VI.3 p. 110 and V.9 p. 81), since `\xxref` makes a call to `\linenum` in order to do its work.)

XXIV Side notes

Regular `\marginpars` do not work inside numbered text — they do not produce any note but do put an extra unnumbered blank line into the text.

\@xympar Changing `\@xympar` a little at least ensures that `\marginpars` in numbered text do not disturb the flow.

```
4820 \preto{cmd}{\@xympar}%
4821 {\ifnumbered{par}@
4822   \led@warn@NoMarginpars
4823   \@esphack
4824 }{\else}%
4825 {}%
4826 {}%
4827
4828 \appto{cmd}{\@xympar}%
4829 {\fi}%
4830 {}
4831 {}%
4832
4833 %
```

We provide side notes as replacement for `\marginpar` in numbered text.

\sidenote@margin These are the sidenote equivalents to `\line@margin` and `\linenummargin` for specifying which margin. The default is the right margin (opposite to the default for line numbers). `\l@dgegetsidenote@margin` returns the number associated to side note margin:

left : 0
right : 1
outer : 2
inner : 3

```

\vl@dlnote Put the left/right text into boxes, but just save the moveable text. **\l@dcsnotetext**,
\vl@drsnote **\l@dcsnotetext@l** and **\l@dcsnotetext@r** are etoolbox's lists which will store the
\vl@dcsnote content of side notes. We store the content in lists, because we need to loop later on
them, in case many sidenote co-exist for the same line. That is there some special test
to do, in order to:

- Store the content of **\leadsidenote** to **\l@dcsnotetext** in any cases.
- Store the content of **\rightsidenote** to:
 - **\l@dcsnotetext** if **\leadsidenote** is to be put on right.
 - **\l@dcsnotetext@r** if **\leadsidenote** is to be put on left.
- Store the content of **\leftsidenote** to:
 - **\l@dcsnotetext** if **\leadsidenote** is to be put on left.

- $\backslash l@dcsonotetext@l$ if $\backslash ledsonote$ is to be put on right.

XXV Minipages and such

We can put footnotes into minipages. The preparatory code has been set up earlier, all that remains is to ensure that it is available inside a minipage box. This requires some alteration to the kernel code, specifically the `\@iiiminipage` and `\endminipage` macros. We will arrange this so that additional series can be easily added.

`\l@dfbeginmini` These will be the hooks in `\@iiiminipage` and `\endminipage`.

`\l@dfendmini` They can be extended to handle other things if necessary.

Eledmac and ledmac were using the specific indexing tools of the memoir in order to allow multiple index. However, eledmac used `imakeidx` or `indextools` tools when one these two package was loaded. This system forced to maintained a double code, which was not very useful. Since `reledmac`, we use only the `imakeidx` or `indextools` tools.

The `memoir` class provides more flexible indexing than the standard classes. We need different code if the `memoir` class is being used, except if `imakeidx` or `indextools` is used.

`\edindex` Write the index information to the `idx` file.

XXVII Verse

The original code is principally Wayne Sullivan's code from `edstanza`. However, the code has been many time modified by Maïeul Rouquette in order to obtain new features and improved compatibility with `reledpar`.

XXVII.1 Hanging symbol management

`\@hangingsymbol` The macro `\@hangingsymbol` is used to insert a symbol on each hanging of verses. It is set by user level macro `\sethangingsymbol`.

`\ifinstanza` For example, in french typographie the symbol is '['. We obtain it by the next code:

```
\sethangingsymbol{[\,]}
```

The `\ifinstanza` boolean is used to be sure that we are in a stanza part.

```
5461 \def\@hangingsymbol{}  
5462 \newcommand*\sethangingsymbol[1]{%  
5463   \gdef\@hangingsymbol{\#1}%  
5464 }%  
5465 \newif\ifinstanza  
5466 %
```

`\inserthangingsymbol` The boolean `\ifinserthangingsymbol` is set to TRUE when `\@clock` is greater than 1, i.e. when we are not in the first line of a verse. The switch of `\ifinserthangingsymbol` is made in `\do@line` before the printing of line but after the line number calculation.

```
5467 \newif\ifinserthangingsymbol  
5468 \newcommand{\inserthangingsymbol}{%  
5469 \ifinserthangingsymbol%  
5470   \ifinstanza%  
5471     \@hangingsymbol%  
5472     \fi%  
5473 \fi%  
5474 }  
5475 %
```

XXVII.2 Using & character

`\ampersand` Within a stanza the `\&` macro is going to be usurped. We need an alias in case an `&` needs to be typeset in a stanza. Define it rather than letting it in case some other package has already defined it.

```
5476 \newcommand*\ampersand{\char`\&}  
5477 %  
5478 %
```

XXVII.3 Code category setting

`\stanza@count` Before we can define the main macros we need to save and reset some category codes.
`\stanzaindentbase` To save the current values we use `\next` and `\body` from the `\loop` macro.

```

5479   \chardef\body=\catcode`@\@%
5480   \catcode`\@=11
5481   \chardef\next=\catcode`\&
5482   \catcode`\&=\active
5483 %
5484 %

```

XXVII.4 Stanza count and indent

A count register is allocated for counting lines in a stanza; also allocated is a dimension register which is used to specify the base value for line indentation; all stanza indentations are multiples of this value. The default value of `\stanzaindentbase` is 20pt.

```

5485   \newcount\stanza@count
5486   \newlength{\stanzaindentbase}
5487   \setlength{\stanzaindentbase}{20pt}
5488 %
5489 %

```

`\strip@szacnt` The indentations of stanza lines are non-negative integer multiples of the unit called `\stanzaindentbase`. To make it easier for the user to specify these numbers, some list macros are defined. These take numerical values in a list separated by commas and assign the values to special control sequences using `\mathchardef`. Though this does limit the range from 0 to 32767, it should suffice for most applications, including *penalties*, which will be discussed below.

```

5490 \def\strip@szacnt#1,#2|{\def\@tempb{#1}\def\@tempa{#2|}}
5491 \newcommand*{\setstanzavalues}[2]{\def\@tempa{#2,,|}%
5492   \stanza@count\z@%
5493   \def\next{\expandafter\strip@szacnt\@tempa
5494     \ifx\@tempb\empty\let\next\relax\else
5495       \expandafter\mathchardef\csname #1@\number\stanza@count
5496       @\endcsname\@tempb\relax
5497       \advance\stanza@count\@ne\fi\next}%
5498   \next}%
5499 %
5500 %

```

`\setstanzaindents` In the original edmac, `\setstanzavalues{sza}{...}` had to be called to set the indents, and similarly `\setstanzavalues{szp}{...}` to set the penalties. `\setstanzaindents` and `\setstanzapenalties` macros are a convenience to give the user one less thing to worry about (misspelling the first argument).

```

5501 \newcommand*{\setstanzaindents}[1]{\setstanzavalues{sza}{#1}}
5502 \newcommand*{\setstanzapenalties}[1]{\setstanzavalues{szp}{#1}}

```

```
5503 %
5504 %
```

- \managestanza@modulo** Since version 0.13, the `stanzaindentrepetition` counter can be used when the indentation is repeated every n verses. The `\managestanza@modulo` is a command which modifies the counter `stanza@modulo`. The command adds 1 to `stanza@modulo`, but if `stanza@modulo` is equal to the `stanzaindentrepetition` counter, the command restarts it.

```
5505 \newcounter{stanzaindentrepetition}
5506 \newcount\stanza@modulo
5507
5508 \newcommand*\managestanza@modulo[0]{
5509     \advance\stanza@modulo\@ne
5510     \ifnum\stanza@modulo>\value{stanzaindentrepetition}
5511         \stanza@modulo\@ne
5512     \fi
5513 }
5514 %
```

- \stanzaindent** The macro `\stanzaindent`, when called at the beginning of a verse, changes the indentation normally defined for this verse by `\setstanzaindent`. The starred version skips the current verse for the repetition of stanza indent.

```
5515 \newcommand{\stanzaindent}[1]{%
5516     \hspace{\dimexpr#1\stanzaindentbase-\parindent\relax}%
5517     \ignorespaces%
5518 }%
5519 \WithSuffix\newcommand\stanzaindent*[1]{%
5520     \stanzaindent{#1}%
5521     \global\advance\stanza@modulo-\@ne%
5522     \ifnum\stanza@modulo=0%
5523         \global\stanza@modulo=\value{stanzaindentrepetition}%
5524     \fi%
5525     \ignorespaces%
5526 }%
5527 %
```

XXVII.5 Numbering stanza

Here, macro for numbering stanza. First, the stanza counter.

```
\thestanza28 \newcounter{stanza}
5529 \renewcommand{\thestanza}{%
5530     \textbf{\arabic{stanza}}%
5531 }
5532 %
```

`\ifnumberstanza` Then, macro to activate automatically numbering of stanza.

```
5533 \newif\ifnumberstanza%
5534 %
```

`\@insertstanzanumber` Now, macro called at the first line of of verse of a stanza.

```
5535 \newcommand{\@insertstanzanumber}[0]{%
5536   \ifnumberstanza%
5537     \ifl@dpairing%
5538       \ifledRcol%
5539         \stanzanumwrapper{\thestanzaR}%
5540       \else%
5541         \stanzanumwrapper{\thestanzaL}%
5542       \fi%
5543     \else%
5544       \stanzanumwrapper{\thestanza}%
5545     \fi%
5546     \setline{1}%
5547   \fi%
5548 }%
5549 %
```

`\@advancestanzanumber` Also a command to advance the counter of stanza.

```
5550 \newcommand{\@advancestanzanumber}[0]{%
5551   \ifnumberstanza%
5552     \ifl@dpairing%
5553       \ifledRcol%
5554         \addtocounter{stanzaR}{1}%
5555       \else%
5556         \addtocounter{stanzaL}{1}%
5557       \fi%
5558     \else%
5559       \addtocounter{stanza}{1}%
5560     \fi%
5561   \fi%
5562 }%
5563 %
```

`\stanzanumwrapper` And finally, the wrapper for stanza number

```
5564 \newcommand{\stanzanumwrapper}[1]{%
5565   \flagstanza{#1}%
5566 }%
5567 %
```

XXVII.6 Stanza number in note

Here, the command called when printing stanza number in notes.

```

5568 \newcommand{\printstanza}[0]{%
5569   \ifboolexpr{bool{l@dpairing} or bool{l@printingpages} or bool{%
5570     l@printingcolumns}}{%
5571     \ifledRcol@%
5572       \thestanzaR%
5573     \else%
5574       \thestanzaL%
5575     \fi%
5576   }{%
5577     \thestanza%
5578   }%
5579 }

```

XXVII.7 Main work

`\stanza@line` Now we arrive at the main works. `\stanza@line` sets the indentation for the line and starts a numbered paragraph—each line is treated as a paragraph. `\stanza@hang` sets the hanging indentation to be used if the stanza line requires more than one print line. `\sza@penalty`

If it is known that each stanza line will fit on one print line, it is advisable to set the hanging indentation to zero. `\sza@penalty` places the specified penalty following each stanza line. By default, this facility is turned off so that no penalty is included. However, the user may initiate these penalties to indicate good and bad places in the stanza for page breaking.

```

5580 \newcommandx{\stanza@line}[1][1]{%
5581   \ifnum\value{stanzaindentsrepetition}=0
5582     \parindent=\csname sza@\number\stanza@count
5583       @\endcsname\stanzaindentbase
5584   \else
5585     \parindent=\csname sza@\number\stanza@modulo
5586       @\endcsname\stanzaindentbase
5587     \managestanza@modulo
5588   \fi
5589   \pstart[#1]\stanza@hang\ignorespaces}
5590 \xdef\stanza@hang{\noexpand\leavevmode\noexpand\startlock
5591   \hangindent\expandafter
5592     \noexpand\csname sza@0@\endcsname\stanzaindentbase
5593     \hangafter\@ne}
5594 \def\sza@penalty{\count@\csname szp@\number\stanza@count @\endcsname
5595   \ifnum\count@>\@M\advance\count@-\@M\penalty-\else
5596     \penalty\fi\count@}
5597 %

```

`\@startstanza` Now we have the components of the `\stanza` macro, which appears at the start of a group of lines. This macro initializes the count and checks to see if hanging indentation and penalties are to be included. Hanging indentation suspends the line count, so that the enumeration is by verse line rather than by print line. If the print line count is `\stanza`
`\@stopstanza`
`\newverse`

desired, invoke `\let\startlock\relax` and do the same for `\endlock`. Here and above we have used `\xdef` to make the stored macros take up a bit less space, but it also makes them more obscure to the reader. Lines of the stanza are delimited by ampersands `&`. The last line of the stanza must end with `\&`.

```

5598 \xdef\@startstanza[#1]{%

XXVII.8 Restore catcode and penalties

The ampersand & is used to mark the end of each stanza line, except the last, which is marked with \&. This means that \halign may not be used directly within a stanza line. This does not affect macros involving alignments defined outside \stanza \&. Since these macros usurp the control sequence \&, the replacement \ampersand is defined to be used if this symbol is needed in a stanza. Also we reset the modified category codes and initialize the penalty default.

```

5636 \catcode`&=\next
5637 \catcode`@=\body
5638 \setstanzavalues{szp}{0}
5639 %

```

XXVIII Arrays and tables

XXVIII.1 Preamble: macro as environment

The following is borrowed, and renamed, from the amsmath package. See also the CTT thread ‘eeq and amstex’, 1995/08/31, started by Keith Reckdahl and ended definitively by David M. Jones.

Several of the [math] macros scan their body twice. This means we must collect all text in the body of an environment form before calling the macro.

\emptytoks This is actually defined in the amsgen package.

```

5641 \newtoks\emptytoks
5642 %
5643 %

```

The rest is from amsmath.

\l@envbody A token register to contain the body.

```

5644 \newtoks\l@envbody
5645 %
5646 %

```

\addtol@envbody \addtol@envbody{arg} adds arg to the token register \l@envbody.

```

5647 \newcommand{\addtol@envbody}[1]{%
5648   \global\l@envbody\expandafter{\the\l@envbody#1}%
5649 %
5650 %

```

\l@dcollect@body The macro `\l@dcollect@body` starts the scan for the `\end{⟨env⟩}` command of the current environment. It takes a macro name as argument. This macro is supposed to take the whole body of the environment as its argument. For example, given `cenv#1{...}` as a macro that processes #1, then the environment form, `\begin{env}` would call `\l@dcollect@body\cenv`.

```

5651 \newcommand{\l@dcollect@body}[1]{%
5652   \l@denvbody{\expandafter#1\expandafter{\the\l@denvbody}}%
5653   \edef\processl@denvbody{\the\l@denvbody\noexpand\end{\@currenvir}}%
5654   \l@denvbody\@emptytoks \def\l@dbegin@stack{b}%
5655   \begingroup
5656     \expandafter\let\csname@\currenvir\endcsname\l@dcollect@@body
5657     \edef\processl@denvbody{\expandafter\noexpand\csname@\currenvir\
5658       endcsname}%
5659     \processl@denvbody%
5660   }%
5661 %

```

\l@dpush@begins When adding a piece of the current environment's contents to `\l@denvbody`, we scan it to check for additional `\begin` tokens, and add a 'b' to the stack for any that we find.

```

5662 \def\l@dpush@begins#1\begin#2{%
5663   \ifx\end#2\else b\expandafter\l@dpush@begins\fi}
5664 %
5665 %

```

\l@dcollect@@body `\l@dcollect@@body` takes two arguments: the first will consist of all text up to the next `\end` command, and the second will be the `\end` command's argument. If there are any extra `\begin` commands in the body text, a marker is pushed onto a stack by the `\l@dpush@begins` function. Empty state for this stack means we have reached the `\end` that matches our original `\begin`. Otherwise we need to include the `\end` and its argument in the material we are adding to the environment body accumulator.

```

5666 \def\l@dcollect@@body#1\end#2{%
5667   \edef\l@dbegin@stack{\l@dpush@begins#1\begin\end
5668   \expandafter\@gobble\l@dbegin@stack}%
5669   \ifx\@empty\l@dbegin@stack

5672     \addtol@denvbody{#1}%
5673   \else
5674     \addtol@denvbody{#1\end{#2}}%
5675   \fi
5676   \processl@denvbody % A little tricky! Note the grouping
5677 }
5678 %
5679 %

```

There was a question on CTT about how to use `\collect@body` for a macro taking an argument. The following is part of that thread.

From: Heiko Oberdiek <oberdiek@uni-freiburg.de>
Newsgroups: comp.text.tex
Subject: Re: Using `\collect@body` with commands that take >1 argument
Date: Fri, 08 Aug 2003 09:03:20 +0200

eed132@psu.edu (Evan) wrote:

You will get an error message: Command `\redbox` already defined.
 Thus you must rename either the command `\redbox` or the environment name.

> `\begin{coloredbox}{blue}`
 > Yadda yadda yadda... this is on a blue background...
 > `\end{coloredbox}`
 > and can't figure out how to make the `\collect@body` take this.

 > `\collect@body {\colorbox{red}}`

The argument of `\collect@body` has to be one token exactly.

```
\documentclass{article}
\usepackage{color}
\usepackage{amsmath}

\newcommand{\redbox}[1]{\colorbox{red}{#1}}
\makeatletter
\newenvironment{coloredbox}[1]{%
  \def\next@{\colorbox{#1}}%
  \collect@body\next@
}{}{}

% ignore spaces at begin and end of environment
\newenvironment{coloredboxII}[1]{%
  \def\next@{\mycoloredbox{#1}}%
  \collect@body\next@
}
```

```

}{}}
\newcommand{\mycoloredbox}[2]{%
  \colorbox{#1}{\ignorespaces#2\unskip}%
}

% support of optional color model argument
\newcommand\coloredboxIII\endcsname{%
\def\coloredboxIII#1{%
  \colorbox{#1}{\ignorespaces#1\unskip}%
}
\def\@coloredboxIII#1#2{%
  \def\next@{\mycoloredboxIII{#1}{#2}}%
  \collect@body\next@
}
\newcommand{\mycoloredboxIII}[3]{%
  \colorbox{#1}{#2}{\ignorespaces#3\unskip}%
}

\makeatother

\begin{document}
Black text before
\begin{coloredbox}{blue}

\end{coloredboxIII}
Black text after

\end{document}

Yours sincerely
Heiko <oberdiek@uni-freiburg.de>

```

XXVIII.2 Tabular environments

This is based on the work by Herbert Breger in developing `tabmac.tex`.

The original `tabmac.tex` file was void of comments or any explanatory text other

than the above notice. The algorithm is Breger's. Peter Wilson have made some cosmetic changes to the original code and reimplemented some things so they are more LaTeX-like. All the commentary are from Peter Wilson, as are any mistake or errors.

However, Maïeul Rouquette has modified code in order to add new features of `eledmac` and `reledmac`.

XXVIII.2.1 Disabling and restoring commands

`\l@dtabnoexpands` More no expansion for critical and familiar footnotes in tabular environment.

```

\edbeforetab The macro `\edbeforetab{<text>}{<math>}` puts $<\text{text}>$ at the left margin before array cell entry $<\text{math}>$. Conversely, the macro `\edaftertab{<math>}{<text>}` puts $<\text{text}>$ at the right margin after array cell entry $<\text{math}>$. `\edbeforetab` should be in the first column and `\edaftertab` in the last column. The following macros support these.

\leftltab `\leftltab{<text>}` for `\edbeforetab` in `\ltab`.

```

XXX Section's title commands

XXX.1 Commands to disable some feature

`\ledsectnotoc` The `\ledsectnotoc` only disables the `\addcontentsline` macro.

```

6408 \newcommand{\ledsectnotoc}{\let\addcontentsline\@gobblethree}
6409 %

```

`\ledsectnomark` The `\ledsectnomark` only disables the `\chaptermark`, `\sectionmark` and `\subsectionmark` macros.

```

6410 \newcommand{\ledsectnomark}{%
6411   \let\chaptermark\@gobble%
6412   \let\sectionmark\@gobble%
6413   \let\subsectionmark\@gobble%
6414 }
6415 %

```

XXX.2 General overview

The system of `\eledxxxx` commands to section text work like this:

1. When one of these commands is called, `reledmac` writes to an auxiliary files:
 - The section level.
 - The section title.
 - The side (when `eledpar` is used).
 - The pstart where the command is called.
 - If we have starred version or not.
2. `reledmac` adds the title of the section to pstart, as normal content. This is to enable critical notes.
3. When `LETEX` is run a other time, this file is read. That:
 - Adds the pstart number to a list of pstarts where a sectioning command is used.
 - Defines a command, the name of which contains the pstart number, and which calls the normal `LETEX` sectioning command.
4. This last command is called when the pstart is effectively printed.

XXX.3 \beforeeledchapter command

We do not define commands for `\eledsection` and related if the `noeledsec` option is loaded. We use `etoolbox` tests and not the `\ifxxx... \else... \fi` structure to prevent problem of expansions with command after the `\ifxxx` which contains `\fi`. As we patch command inside this test, we need to change the category code of `#` character *before* `\notbool` statement, because the second argument is read with the standard catcode (read *The TeXbook* to understand when the catcode's change has effect).

```

6416 \catcode`\#=12
6417 \notbool{@noeled@sec}{%
6418 %

```

`\beforeeledchapter` For technical reasons, not yet solved, page-breaking before chapters can't be made automatically by `eledmac`. Users have to use `\beforeeledchapter`.

```

6419 \ifl@dmemoir
6420   \newcommand\beforeeledchapter{%
6421   \clearforchapter%
6422 }
6423 \else
6424   \newcommand\beforeeledchapter{%
6425   \if@openright%
6426   \cleardoublepage%
6427   \else%
6428   \clearpage%
6429   \fi%
6430 }
6431 \fi
6432 %

```

XXX.4 Auxiliary commands

`\if@eled@sectioning` The boolean `\if@eled@sectioning` is set to true when a sectioning command is called by a `\eledxxx` command, and set to false after. It is used to enable/disable line number printing.

```

6433 \newif\if@eled@sectioning
6434 %

```

`\print@leftmargin@eledsection` `\print@leftmargin@eledsection` and `\print@rightmargin@eledsection` are added
`\print@rightmargin@eledsection` by `reledmac` inside the code of sectioning command, in order to affix lines numbers.
They include tests for RTL languages.

```

XXX.5 Patching standard commands

```

\chapter
  \M@sect
  \mem@old@ssect
\makechapterhead
\makechapterhead
\makeschapterhead
  \ssect
  \ssect

```

We have to patch L^AT_EX, book and memoir sectioning commands in order to:

- Disable \edtext inside.
- Disable page breaking (for \chapter).
- Add line numbers and sidenotes.

Unfortunately, Maïeul Rouquette was not able to try if `memoir` is loaded. That is why `eledmac` tries to define for both standard class and `memoir` class.

```

XXX.7 Macros written in the auxiliary file

\eled@chapter \eled@section \eled@subsection \eled@subsubsection

The sectioning macros, called in the auxiliary file. They have five arguments:

1. Optional arguments of L^AT_EX sectioning command.
2. Mandatory arguments of L^AT_EX sectioning command.
3. Pstart number.
4. Side: R if right, nothing if left.
5. Starred or not.

XXXI Page breaking or no page breaking depending of specific lines

By default, page breaks are automatic. However, the user can define lines which will force page breaks, or prevent page breaks around one specific line. On the first run, the line-list file records the line number of where the page break is being changed (either forced, or prevented). On the next run, page breaks occur either before or after this line, depending on how the user sets the command. The default setting is after the line.

`\normal@page@break` `\normal@page@break` is an etoolbox list which contains the absolute line number of the last line, for each page.

```

6846 \def\normal@page@break{}%
6847 %

```

`\prev@pb` The `\l@prev@pb` macro is a etoolbox list, which contains the lines in which page
`\prev@nopb` breaks occur (before or after). The `\l@prev@nopb` macro is a etoolbox list, which contains the lines with NO page break before or after.

```

6848 \def\l@prev@pb{}%
6849 \def\l@prev@nopb{}%
6850 %

```

`\ledpb` The `\ledpb` macro writes the call to `\led@pb` in line-list file. The `\ledpbnum` macro
`\ledpbnum` writes the call to `\led@pbnum` in line-list file. The `\lednopb` macro writes the call to
`\lednopb` in line-list file. The `\lednopbnum` macro writes the call to `\led@nopbnum` in line-list file.

```

6851 \newcommand{\ledpb}{\write\linenum@out{\string\led@pb}}

XXXII Long verse: prevents being separated by a page break

`\iflednoinverse` The `\lednoinverse` boolean is set to false by default. If set to true, `reledmac` will automatically prevent page breaks inside verse. The declaration is made at the beginning of the file, because it is used as a package option.

`\check@pb@in@verse` The `\check@pb@in@verse` checks if a verse is broken in two page. If true, it adds:

- The absolute line number of the first line of the verse -1 in the `\led@pb` list, if the page break must occur before the verse.
- The absolute line number of the first line of the verse -1 in the `\led@nopb` list, if the page break must occur after the verse.

```

Appendix A Some things to do when changing version

Appendix A.1 Migrating from `edmac` to `ledmac`

If you have never used `edmac`, ignore this section. If you have used `edmac` and are starting on a completely new document, ignore this section. Only read this section if you are converting an original `edmac` document to use `ledmac`.

The package still provides the original `\text` command, but it is (a) deprecated, and (b) its name has been changed³³ to `\critext`; use the `\edtext` macro instead. However, if you do use `\critext` (the new name for `\text`), the following is a reminder.

`\critext` Within numbered paragraphs, footnotes and endnotes are generated by forms of the `\critext` macro:

```
\critext{\langle lemma \rangle}{\langle commands \rangle}/
```

The `\langle lemma \rangle` argument is the lemma in the main text: `\critext` both prints this as part of the text, and makes it available to the `\langle commands \rangle` you specify to generate notes. The `/` at the end terminates the command; it is part of the macro's definition so that spaces after the macro will be treated as significant.

For example:

I saw my friend <code>\critext{Smith}</code>	1 I saw my friend
<code>\Afootnote{Jones C, D.}/</code>	2 Smith on Tuesday.
on Tuesday.	<hr/> 2 Smith] Jones C, D.

The lemma `Smith` is printed as part of this sentence in the text, and is also made available to the footnote that specifies a variant, `Jones C, D`. The footnote macro is supplied with the line number at which the lemma appears in the main text.

The `\langle lemma \rangle` may contain further `\critext` commands. Nesting makes it possible to print an explanatory note on a long passage together with notes on variants for individual words within the passage. For example:

<code>\critext{I saw my friend</code>	1 I saw my friend
<code>\critext{Smith}\{\Afootnote{Jones</code>	2 Smith on Tuesday.
<code>C, D.}/ on Tuesday.}</code>	<hr/> 2 Smith] Jones C, D.
<code>\Bfootnote{The date was</code>	<hr/> 1-2 I saw my friend
<code>July 16, 1954.}</code>	Smith on Tuesday.] The
<code>/</code>	date was July 16, 1954.

However, `\critext` cannot handle overlapping but unnested notes—for example, one note covering lines 10–15, and another covering 12–18; a `\critext` that starts in the `\langle lemma \rangle` argument of another `\critext` must end there, too. (The `\lemma` and `\linenum` commands may be used to generate overlapping notes if necessary.)

The second argument of the `\critext` macro, `\langle commands \rangle`, is the same as the second argument to the `\edtext` macro.

It is possible to define aliases for `\critext`, which can be easier to type. You can make a single character substitute for `\critext` by saying this:

³³A name like `\text` is likely to be defined by other L^AT_EX packages (it certainly is by the AMS packages) and it seems sensible to try and avoid clashes with other definitions.

```
\catcode`<=\active
\let<=\critection
```

Then you might say `<{Smith}\variant{Jones}/`. This of course destroys the ability to use `<` in any new macro definitions, so long as it remains in effect; hence it should be used with care.

Changing the character at the end of the command requires more work:

```
\catcode`<=\active
\def\xtext{\#1\#2}{\critection{\#1}{\#2}}
\let<=\xtext
```

This allows you to say `<{Smith}\Afootnote{Jones}>`.

Aliases for `\critection` of the first kind shown here also can't be nested—that is, you can't use the alias in the text that forms the first argument to `\critection`. (See VI p. 102 to find out why.) Aliases of the second kind may be nested without any problem.

If you really have to use `\critection` in any of the tabular or array environments, then `\edtext` must not be used in the same environment. If you use `\critection` in one of these environments then you have to issue the declaration `\usingcritection` beforehand. The declaration `\usingedtext` must be issued to revert to the default assumption that `\edtext` will be used.

Appendix A.2 Migration from ledmac to eledmac

In `eledmac`, some changes were made in the code to allow easy customization. This may cause problems for people who have already made their own. The next sections explain how to handle this.

If you have created your own series using `\addfootins` and `\addfootinsX`, you must use instead the `\newseries` command (see 5.5.1 p. 28), and remove any `\Xfootnote` command.

If you have customized the `\XXXXXXfmt` command, please check whether you can achieve the same by the commands documented for display options (6 p. 28) or `\Xfootnote` options (5.2.2 p. 22). Otherwise please add a new ticket on Github to request a new function for doing this.³⁴

If for some reason you do not want to make the modifications to use the new functions of `eledmac`, you can continue using your own `\XXXXXXfmt` command, but you must replace:

```
\renewcommand*{\XXXXXXfmt}[3]
```

with

```
\renewcommand*{\XXXXXXfmt}[4][4=Z]
```

³⁴<https://github.com/maieul/ledmac/issues>

If you do not make that, you will get a spurious [X], where X is series letter.

If you used a \protect command inside a \footnote command inside a numbered section, you must change the \protect to \noexpand. Otherwise the command after the \protect will be discarded.

Appendix A.3 Migration to elemac 1.5.1

The version 1.5.1 corrects a bug in `stanzaindent repetition` (cf. 8.3 p. 39). This bug had two consequences:

1. `stanzaindent repetition` did not work when its value was greater than 2.
2. `stanzaindent repetition` worked wrong when its value was equal to 2.

So, if you used `stanzaindent repetition` with a value equal to 2, you had to change your `\setstanzaindent`. Explanation:

```
\setcounter{stanzaindent repetition}{2}
\setstanzaindent{5,1,0}
```

This code, in versions prior to 1.5.1, made the first line have an indentation of 0, the second line of 1, the third verse of 0, the fourth verse of 1 and so forth.

But this code should have instead achieved quite the contrary: the first line would have an indentation of 1, the second line of 0, the third line of 1, the fourth line of 0 and so forth.

So version 1.5.1 corrected this bug. If you want to keep the former presentation, you must change:

```
\setcounter{stanzaindent repetition}{2}
\setstanzaindent{5,1,0}
```

to:

```
\setcounter{stanzaindent repetition}{2}
\setstanzaindent{5,0,1}
```

Appendix A.4 Migration to elemac 1.12.0

The migration to elemac 1.12.0 is easy:

- You must first delete all the auxiliary files, then compile your document three times as usual.
- If you have modified `\l@reg`, which is not advisable, you must rename it to `\@nl@reg`.

There is an additional problem. If you have put text into brackets just after `\pstart` or `\pend`, this text will be considered to be an optional argument of `\pstart` or `\pend` (see 4.2.3 p. 16). If so, add a `\relax` between `\pstart/\pend` and the first bracket.

The version 1.12.0 also introduce a better way to handle sectional divisions inside numbered text. Please read 14.2 p. 52.

Appendix A.5 Migration to eleedmac 17.1

This version changes the default setting of `\Xpstart`. Henceforth, pstart numbers will be printed in footnotes within the section of text where you have called `\numberpstarttrue`.

We do not see any reason to print them in the other sections. However, if you want to print the pstart numbers in all of the footnotes, whatever the section, without having to use `\numberpstarttrue`, you can use `\Xpstarteverytime`.

Appendix A.6 Migration to eleedmac 1.21.0

Appendix A.6.1 `\Xledsetnormalparstuff` and `\ledsetnormalparstuffX`

The `\ledsetnormalparstuff` has been split into two different commands:

- `\Xledsetnormalparstuff` for critical notes;
- `\ledsetnormalparstuffX` for familiar notes.

Both commands can take an optional argument which is the series letter. If you have redefined `\ledsetnormalparstuff` or any of the commands which call them, you must change them accordingly.

Appendix A.6.2 Endnotes

In any case, delete the `.end` file before the next run.

The previous version of Eleedmac had a bug: there were two spaces between the starting page number and the starting line number, but only one space between the ending page number and the ending line number.

As a matter of fact, a spurious space was added after the first `\printnpnum`. This spurious space has been deleted. However, if you want to keep the previous spurious space, you may load the package with the `oldprintnpnumspace` option.

If you have redefined `\endprint`, you must:

- Contact us and ask for the feature that required your hack, in order to avoid such a hack in the future.
- Use the new fifth argument.
- Add `\xdef\@currentseries{#4}` at the beginning of your own command.

Appendix A.7 Migration to eleedmac 1.22.0

The `\ledinnote` command now takes a first optional argument, which is the label for the hyperreference. If you have redefined it, change your redefinition, and check whether you can avoid this redefinition by only redefining `\ledinnotemark`.

Appendix A.8 Migration to eleedmac 1.23.0

You must delete the numbered auxiliary files before compiling with the new version of eleedmac.

Appendix A.9 Migration from `eledmac` to `reledmac`

There are many changes in `reledmac` which require the user to make modifications.

Appendix A.9.1 Risk of ‘no room for a new’

The risk to obtain a ‘no room for a new something’ error is greater in `reledmac` than it is in `eledmac`. See 17.2 p. 54 in order to know how to limit it.

Appendix A.9.2 Multiple indices with `memoir`

`Eledmac` and `ledmac` used the specific indexing tools of the `memoir` class designed to produce multiple indices. However, `eledmac` could also use `imakeidx` or `indextools` tools independently of the `memoir` class. This system forced to maintain redundant code. Since `reledmac`, we use only the `imakeidx` or `indextools` tools.

Consequently: Users of `memoir` are invited to use `indextool` or `imakeidx` to produce multiple indices.

Appendix A.9.3 Deprecated commands and options

The table of deprecated commands and their alternatives follows. Note that the way some commands must be used may have changed. Please read the handbook.

<i>Deprecated command</i>	<i>Replaced with</i>
<code>\addfootins</code>	<code>\newseries</code>
<code>\addfootinsX</code>	<code>\newseries</code>
<code>\critext</code>	<code>\edtext</code>
<code>\falseverse</code>	<code>\newverse</code>
<code>\interparanote glue</code>	<code>\Xafternote</code> and <code>\afternoteX</code>
<code>\ledchapter</code>	<code>\eledchapter</code>
<code>\ledsection</code>	<code>\eledsection</code>
<code>\ledsetnormalparstuff</code>	<code>\Xledsetnormalparstuff</code> and <code>\ledsetnormalparstuffX</code>
<code>\ledsubsection</code>	<code>\eledsubsection</code>
<code>\ledsubsubsection</code>	<code>\eledsubsubsection</code>
<code>\noeledsec</code>	Package option <code>noeledsec</code>
<code>\noendnotes</code>	Package option <code>noendnotes</code>
<code>\pageparbreak</code>	<code>\ledpb</code>

The `ledsecnolinenumbers` option has been removed, because it was related to deprecated commands.

The `oldprintnpnumspace` option has been removed too, because it was related to a historical bug. The `\usingedtext` and `\usingcritext` commands are also deprecated.

Appendix A.9.4 \renewcommand replaced by command

Many uses of \renewcommand have been replaced with uses of specific commands. Please read handbook about specific commands.

<i>Deprecated \renewcommand</i>	<i>Replaced with</i>
\@led@extranofeet	\newsseries
\apprefprefixmore	\setapprefprefixmore
\apprefprefixsingle	\setapprefprefixsingle
\endstanzaextra	Optional argument of \&

\startstanzahook	Optional argument of \stanza
\symplinenum	\Xsymlinenum

Appendix A.9.5 Commands the names of which have been changed

In order to help the migration from *eledmac* to *reledmac*, you may load *reledmac* with *eledmac-compat* option. However, it is advised not to, and to change the command names themselves instead. In many cases, you use only a few of them, except the \footparagraph command.

<i>Old command</i>	<i>New command</i>

Appendix A.9.6 Endnotes

With *reledmac*, there is now one auxiliary file for every endnotes set (.Aend, .Bend, .Cend etc.). If you have overridden \doendnotes (which you would not have done) you must adapt your code.

Appendix A.9.7 Z Series

The ‘Z’ series of notes has been removed. Only five series are provided now by default: A, B, C, D, E.

Appendix A.9.8 Internal commands

Users who have overridden internal commands, which is wrong, must adapt according to the following. Or better, they should not override any of such commands and use *reledmac* options instead.

- If you have modified \Xfootfmt, note that the fourth argument is now mandatory.
- \unvxh has been replaced with \Xunvxh and \unvxhX with two mandatory arguments.

Appendix A.10 Migration to *reledmac* 2.1.0

Reledmac 2.1.0 fix some bug when using \Xbhooknote and \bhooknoteX not in order to execute code at the beginning of each notes, but to insert content of at the beginning of each notes.

People which use these commands to do it, which is not the original idea, must change to things:

1. Horizontal space is no more automatically added after the content of \Xbhooknote/\bhooknoteX argument. You must include it manually. So instead of \Xbhooknote{content}, use \Xbhooknote{content }.
2. Indent is no more automatically added before the content of \Xbhooknote/\bhooknoteX argument. If you want to keep it, add \indent in the argument of \Xbhooknote/\bhooknoteX.

Change History

v0.1.0.

General: First public release 1

v0.2.0.

General: Added tabmac code, and extended indexing 1

\ifl@dmemoir: Added \ifl@dmemoir for memoir class having been used 61

\morenoexpands: Added \l@ddtabnoexpands to \no@expands 104

\reledmac@error: Added \eledmac@error and replaced error messages 62

v0.2.1.

\@lab: Removed page setting from \@lab 215

General: Added text about normal labeling 44

Bug fixes and match with mempatch v1.8 1

Major changes to insert code when memoir is loaded 211

\doxtrafeet: Renamed \doxtrafeet to \l@ddoxtrafeet 208

\edlabel: Tweaked \edlabel to get correct page numbers 213

\l@ddodoreinxtrafeet: Renamed \dodoreinxtrafeet to \l@ddodoreinxtrafeet 209

\morenoexpands: Removed some \lets from \no@expands. These were in edmac but

Peter Wilson feels that they should not have been as they disabled page/line refs in a
footnotes 104

\zz@@@: Minor change to \zz@@@ 213

v0.2.2.

General: Improved paragraph footnotes 1

New Dekker example 1

Used \providetcommand for \@gobblethree to avoid clash with the amsfonts pack-
age 67

\footfudgefiddle: Added \footfudgefiddle 145

\line@list@stuff: Added initial write of page number in \line@list@stuff 98

\para@footsetup: Added \footfudgefiddle to \para@footsetup 146

\para@footsetupX: Added \footfudgefiddle to \para@footsetupX 178

v0.3.0.

\@lab: Replaced \the\line@num by \linenumr@p\line@num in \@lab, and similar for
sub-lines 215

\onl@reg: Added a bunch of code to \onl for handling \setlinenum 87

General: Includes edstanza and more 1

\ledlinenum: Added \linenumr@p and \sublinenumr@p to \leftlinenum and \rightlinenum
. 79

\linenumberlist: Added \linenumberlist mechanism 67

\printendlines: Added \linenumr@p and \sublinenumr@p to \printendlines 191

\printlines: Added \linenumr@p and \sublinenumr@p to \printlines 165

\sublinenumr@p: Added \linenumberstyle and \sublinenumberstyle 78

v0.3.1.

General: Not released. Added remarks about the parallel package 1

v0.4.0.

\@iiiminipage: Modified kernel \@iiiminipage and \endminipage to cater for criti-
cal footnotes 230

General: Added final/draft options 59

Added ledgroup environment 231

Added ledgroupsized environment 231

Added minipage, etc., support 1

\edtext: Added \showlemma to \edtext	105
\l@dgeetendmini: Added \l@dgeetbeginmini, \l@dgeetendmini and all their supporting code	228
\mpnrmalfootgroup: Added \mpnrmalfootgroup	144
\mpnrmalvfootnote: Added \mpnrmalvfootnote	142
\showlemma: Added \showlemma	67
\Xarrangement@normal: Added minpage footnote setup to \footnormal	141
v0.4.1.	
General: Added code for changing \docclearpage	211
Not released. Minor editorial improvements and code tweaks	1
Only change \footnotetext and \footnotemark if memoir not used	167
\edindex: Let eledmac take advantage of memoir's indexing	236
\print@Xnotes: Added \opXfeet	208
\Xdo@feet: Changed \Xdo@feet code for easier extensions	208
v0.5.0.	
\@footnotetext: Enabled regular \footnote in numbered text	167
\@xmpar: Eliminated \marginpar disturbance	222
General: Added left and right side notes	222
Added sidenotes, familiar footnotes in numbered text	1
v0.5.1.	
General: Added moveable side note	222
Fixed right line numbers killed in v0.5	1
Only change \hsize in ledgroupsized environment otherwise page number can be in wrong place	231
\affixline@num: Changed \affixline@num to cater for sidenotes	129
\l@dgeetsidenote@margin: Added \sidenotemargin and \sidenote@margin	222
v0.6.0.	
\@lopR: Added \pend, \pendR, \@lopL and \@lopR in anticipation of parallel processing	89
\@nl@reg: Added \fix@page to \@nl	87
Extended \@nl to include the page number	87
General: Fixed long paragraphs looping	1
Fixed minor typos	1
Prepared for eledpar package	1
\fix@page: Added \last@page@num and \fix@page	88
\new@line: Extended \new@line to output page numbers	98
\vl@dbfnote: Changed \l@dbfnote and \vl@dbfnote as originals could give incorrect markers in the footnotes	168
v0.7.0.	
\@nl@reg: Added \@nl@reg	87
\@ref@reg: Added \@ref@reg	95
General: eledmac having been available for 2 years, deleted the commented out original edmac texts	1
Maïel Rouquette new maintainer	1
Made macros of all messages	61
Replaced all \interAfootnotelinepenalty, etc., by just \interfootnotelinepenalty	1
Tidying up for eledpar and ledarab packages	1
\affixline@num: Added skipnumerating to \affixline@num	129
\do@actions@fixedcode: Added \do@actions@fixedcode	128

\do@actions@next: Added number skipping to \do@actions	126
\do@insidelinehook: Added \do@linehook for use in \do@line	124
\endnumbering: Changed \endnumbering for elepar	70
\f@x@l@cks: Added \ch@cksub@l@ck, \ch@ck@l@ck and \f@x@l@cks	131
\footssplitskips: Added \footssplitskips for use in many footnote styles	139
\get@linelistfile: Added \get@linelistfile	85
\ifledRcol@: Added \l@dnumpstartsL, \ifl@dpairing and \ifpst@rted for/from elepar	67
\initnumbering@reg: Added \initnumbering@reg	69
\l@advance@parledgroup@beforenormalnotes: Added \l@unboxmpfoot containing some common code	230
\l@dcsnotetext@r: Added \l@emptyd@ta	125
\l@dgepline@margin: Added \l@dgepline@margin	75
\l@dgeclock@disp: Added \l@dgeclock@disp	77
\l@dge sidenote@margin: Added \l@dge sidenote@margin	222
\l@drsn@te: Added \l@drsn@te and \l@drsn@te for use in \do@line	125
\l@dzopenalties: Added \l@dzopenalties	120
\ledlinenum: Added \ledlinenum for use by \leftlinenum and \rightlinenum	79
\line@list@stuff: Deleted \page@start from \line@list@stuff	98
\list@clearing@reg: Added \list@clearing@reg	85
\n@num: Added \n@num	94
\normalbfnoteX: Removed extraneous space from \normalbfnoteX	172
\resumenumbering: Changed \resumenumbering for elepar	71
\setprintendlines: Added \setprintendlines for use by \printendlines	189
\setprintlines: Added \setprintlines for use by \printlines	162
\skipnumbering: Added \skipnumbering and supports	101
\sublinenumincrement: Added \firstlinenum, \linenumincrement, \firstsublinenum and \linenumincrement	76
\sublinenumr@p: Using \linenumrep instead of \linenumr@p	78
Using \sublinenumrep instead of \sublinenumr@p	78
\vnumfootnoteX: Removed extraneous space from \vnumfootnoteX	173
v0.8.0.	
General: Bug on endnotes fixed: in a // text, all endnotes will print and be placed at the ends of columns ()	1
v0.8.1.	
General: Bug on \edtext ; \critex ; \lemma fixed: we can now us non-switching commands	1
v0.9.0.	
General: No more ledpatch. All patches are now in the main file.	1
v0.9.1.	
General: Fix some bugs linked to integrating ledpatch on the main file.	1
v0.10.0.	
General: Corrections to \section and other titles in numbered sections	1
v0.11.0.	
General: Makes it possible to add a symbol on each verse's hanging, as in French typography. Redefines the command \hangingsymbol to define the character.	1
v0.12.0.	
General: For compatibility with elepar, possibility to use \autopar on the right side.	1
Possibility to number \pstart	16
Possibility to number the pstart with the commands \numberpstarttrue.	1

\ifledRcol@: Added \ifledRcol and \ifnumberingR for/from eledpar	67
v0.12.1.	
General: Don't number \pstarts of stanza.	1
The numbering of \pstarts restarts on each \beginnumbering.	1
v0.13.0.	
General: New stanzaindentsrepetition counter to repeat stanza indents every <i>n</i> verses.	39
New stanzaindentsrepetition counter: to repeat stanza indents every <i>n</i> verses.	1
\managestanza@modulo: New stanzaindentsrepetition counter to repeat stanza indents every <i>n</i> verses.	242
v0.13.1.	
General: \thepstartL and \thepstartR use now \bfseries and not \bf, which is deprecated and makes conflicts with memoir class.	1
v0.14.0.	
General: Tweaked \edlabel to get correct line number if the command is first element of a paragraph.	1
\edlabel: Tweaked \edlabel to get correct line number if the command is first element of a paragraph.	213
v0.15.0.	
General: Line numbering can be reset at each pstart.	73
Possibility to print \pstart number inside.	16
\affixline@num: Line numbering can be disabled.	129
\ifinserthangingsymbol: New management of hangingsymbol insertion, preventing undesirable insertions.	240
\printlines: Line numbering can be reset at each pstart.	165
v0.17.0.	
\ifinserthangingsymbol: New new management of hangingsymbol insertion, pre- venting undesirable insertions.	240
v1.0.0.	
General: \lemma can contain commands.	23
Debug in lineation command	18
New generic commands to customize footnote display.	28, 201
Options nonum and nosep in \Xfootnote.	22
Options of \Xfootnotes.	137
Possibility to have commands in sidenotes.	45
Some compatibility break with eledmac. Change of name: eledmac.	1
\morenoexpands: Change to be compatible with new features	104
v1.0.1.	
General: Correction on \Xnumberonlyfirstinline with lineation by pstart or by page. 29	
v1.1.0.	
General: Add \labelpstarttrue.	16
Add \Xnumberonlyfirstintwolines	30
Add \Xpstart and \Xonlypstart	31
New hook to add arbitrary code at the beginning of the notes	35
New options for block of notes.	36
New package option: parapparatus.	1
New tools to change order of series	200
Sectioning commands.	51
\preXnotes: New skip \preXnotes@	185
\settoggle@series: \settoggle@series switch the global value of the toggle, not only the local value.	202

v1.2.0.	
\endquote: Compatibility of \ledchapter with the <i>memoir</i> class.	268
\preXnotes: Debug in familiar footnotes (bug introduced by v1.1).	185
v1.3.0.	
\endquote: <i>Quotation</i> and quote environment inside numbered sections.	268
v1.4.0.	
General: Compatibility with LuaTeX of RTL notes.	1
\edtext: Compatibility of \edtext with the right-to-left direction (with Polyglossia).	105
\ledsetnormalparstuffX: Direction of footnotes with polyglossia.	182
\newseries@: Remembers the language of the lemma, in order to create a correct direction for the footnote separator.	195
\rbracket: Switch the right bracket to a left bracket when the lemma is RTL (needs polyglossia or LuaTeX).	157
v1.4.1.	
\affixside@note: Remove spurious spaces.	227
\endquote: New option <i>noquotation</i> .	268
\labelrefsparsesubline: Fix bug with \edlabel.	214
\vl@dbfnote: Compatibility of standard footnotes with <i>eledmac</i> when these footnotes contain any commands.	168
v1.4.2.	
General: Debug with some special classes.	1
v1.4.3.	
General: Add \Xnonbreakableafternumber.	31
Spurious space after familiar footnotes.	1
v1.4.4.	
General: Label inside familiar footnotes.	1
v1.4.5.	
General: Bug with komascript + eledpar + chapter.	1
v1.4.6.	
General: Bug with memoir class introduced by 1.4.5.	1
v1.4.7.	
\endquote: Compatibility of sectioning commands with \autopar.	268
v1.4.8.	
General: Corrects a bug with parallel texts introduced by 1.1.	1
v1.4.9.	
\normalbfnoteX: Allow to redefine \thefootnoteX with alph when some packages are loaded.	172
v1.5.0.	
General: Correct indexing when the call is made in critical notes.	232
\do@insidelinehook: Added \do@insidelinehook for use in \do@line	124
\edindex: Compatibility with <i>imakeidx</i> package, and possibility to use multiple index with \edindex.	236
v1.5.1.	
\managestanza@modulo: Correct stanzaidentsrepetition counter	242
\normalvfootnoteX: Fix bug with normal familiar footnotes when mixing RTL and LTR text.	169
v1.6.0.	
\newverse: Add \falseverse macro.	244
v1.6.1.	
General: Corrects a false hanging verse when a verse is exactly the length of a line.	1

\AtEveryPstart: Spurious space in \pstart.	117
\ifinserthangingsymbol: Hang verse is now not automatically flush right.	240
\l@dunhbox@line: Move the call to \inserthangingsymbol to allow use \hfill inside.	122
\pend: Spurious space in \pend.	119
v1.7.0.	
General: New features for managing page breaks.	53
v1.8.0.	
General: Compatibility with parledgroup option of eledpar package.	1
If <code>imakeidx</code> and <code>hyperref</code> are loaded, adds <code>hyperref</code> in the index.	232
\endquote: Correction of sectioning commands in parallel texts.	268
\get@index@command: Debug \get@index@command and compatibility with <code>hyperref</code> package.	235
\newhookcommand@series@reload: Debug \beforenotesX and \maxnotesX which did not work.	204
\prevpage@num: Correct \parafootsep when using with ledgroup.	151
v1.8.1.	
General: Debug endnotes when more than one series is used (change the position where tools for endnotes are defined).	186
v1.8.2.	
General: Debug compatibility problem with hebrew option of babel package.	1
v1.8.3.	
General: Fixes spurious spaces added by v1.7.0.	1
v1.8.5.	
General: Debug indexing in right column, with eledpar.	232
v1.9.0.	
\doxtrafeet: Add \fnpos to choice the order of footnotes.	208
\l@dfeetendmini: Add \mpfnpos to choice the order of footnotes in minipage / ledgroup.	228
v1.10.0.	
General: Add \pstartref and \xpstartref to refer to a pstart number (extension of \edlabel).	1
\endquote: Correction of sectioning commands in parallel texts.	268
v1.10.1.	
General: Compatibility with cleveref.	1
v1.10.2.	
General: Compatibility of stanza with v1.8a of babel-greek.	1
v1.10.3.	
General: Debug of cross-referencing.	1
v1.10.4.	
General: Debug of critical notes in edtabular environment.	1
v1.10.5.	
General: Debug of \pausenumbering.	1
Debug of \xxref.	1
v1.10.6.	
General: Debug of interaction between \autopar and \pausenumbering.	1
v1.11.0.	
General: Add hooks to disable the font selection for lemma in footnote.	34
v1.11.1.	
General: Correct a bug when a critical note starts with plus or minus.	1

v1.12.0.

\@nl@reg: To ensure compatibility with \musixtex, \@l becomes \@l. Consequently,	86
\@l@reg becomes \@nl@reg.	86
General: Add \ledinnernote and \ledouternote commands.	45
Add \Xendparagraph and related settings.	37
Add hyperlink to crossref (needs hyperref package).	42
Compatibility with musixtex.	1
Debug elemac sectioning command after using \resumenumerumbering.	1
Ensure that imakeidx is loaded <i>before</i> elemac	232
New hooks: \Xafterrule and \afterruleX	37
New options for ragged-paragraph notes	36
New sectioning commands.	51
Optional arguments for \pstart and \pend.	16
\AtEveryPstart: New optional argument for \pstart, to execute code before it.	117
\edindex: Use correctly default index when imakeidx is loaded.	236
\endquote: \ledxxx sectioning commands are deprecated and replaced by \eledxxx	
commands.	268
\ifledRcol@: Add \ifledRcol@ for elepar	67
\initnumbering@reg: \beginnumbering is defined only on elemac, not on elepar.	69
\ldcsnote: \ldclsnote, \ldrnote and \ldcsnote defined only one time, in	
elemac, including needs for elepar case.	224
\ldgetssidenote@margin: \sidenotemargin is now directly defined in elemac to	
be able to manage elepar.	222
\ldunhbox@line: \do@line is split in more little commands.	122
\newhookcommand@series@reload: Debug \beforenotesX and \maxnotesX which	
did not work when called after \footparagraphX.	204
Debug \Xbeforenotes and \Xmaxnotes which did not work when called after	
\footparagraph.	204
\pend: New optional argument for \pend, to execute code after it.	119
\stanza: &can have an optional argument: content to be printed after.	244
\Stanza can have an optional argument: content to be printed before.	244
Add \newverse macro, \falseverse deprecated.	244
v1.12.1.	
\wrap@edcrossref: Fix spurious spaces.	217
v1.12.2.	
\ldunhbox@line: Fix a bug with critical notes at the tops of pages (added by v12.0.0)	122
v1.12.3.	
General: Add macros for new messages since v0.7	61
Correct bug with side and familiar notes in tabular environments.	1
Debug \eledxxx with some paper size	1
Debug \ledinnernote and \ledouternote commands in the top of pages.	45
Debug left and right notes (bugs added by 1.12.0)	1
Underline lemma in \eledxxx when using draft mode.	1
\flag@end: \flag@start and \flag@end are now defined only one time for elemac	
and elepar	99
\flag@start send a error message when a \edtext is done without insert (note) .	99
\reledmac@error: Replaced error messages	62
v1.12.4.	
General: Debug spurious page breaks before \chapter (bug added in 1.12.0)	1

v1.12.5.	\@edindex@\hyperref: Debug \edindex when hyperref is not loaded	237
	\@ssect: Debug \eledchapter in parallel with memoir	272
	\doinsidelinehook: Added \dolinehook and \doinsidelinehook	125
	\endnumbering: Allow to mix parallel columns and normal text when using \pausenumbering	70
	\l@dgobblearg: \l@dgobblearg becomes \l@dgobbleoptarg	252
	\l@restoreforedtext: Debug optional arguments of \Xfootnote in tabular context .	252
	\resumenumbering: Debug \resumenumbering	71
v1.12.7.	\wrap@\edcrossref: \wrap@\edcrossref is now robust	217
v1.12.8.	\flag@end: \flag@start do not send a error message when a \edtext is done without insert (note) but have a endnote	99
v1.13.0.	General: Add \Xnoteswidthliketwocolumns and \noteswidthliketwocolumnsX	37
	Added widthliketwocolumns option	59
	\newhooktoggleg@series@reload: Add \newhookcommand@toggle@reload	204
	\para@footsetupX: In \para@footsetupX, use \columnwidth instead of \hsize	178
	\settoggleg@series: \settoggleg@series can take an optional arguments to reload series setup	202
v1.13.1.	General: Coming back of page and line breaking penalties's management, deleted by error in v0.17.	1
	Debug quotation environment inside of a \pstart preceded by a sectioning command.	1
	\thepstart: Add \l@dzeroopenalties in \pstart	117
v1.13.2.	General: Fix bug with normal footnotes, added by v1.13.0.	1
	\ifledRcol@: Add \ifl@dpaging for \eledpar	67
v1.13.3.	General: Fix extra spaces with paragraphed footnotes, added by v1.13.0.	1
v1.13.4.	General: Fix bug with index when memoir class is used without hyperref	1
v1.14.0.	General: Debug spurious characters before endnotes.	186
	Delete previous override of \l@d@owrindexhyp at the beginning of a document when hyperref is not loaded.	239
	Move gobbling command	67
	Provide \@gobblefour	67
	\edindex: Let elemac take advantage of imakeidx even when memoir class is used	236
v1.14.1.	\@ssect: Debug sectioning commands when using both handout and hyperref pack- age.	275
v1.14.2.	\@ssect: Debug \edtext after starred sectioning commands when using memoir class. .	272
v1.15.0.	\@edtext@level: New boolean \if@edtext@.	105
	General: Fix bug with footnotes layout when using some options of the geometry package (bug add by v1.13.0).	1
	New commands \AtEveryPstart and \AtEveryPend.	16

New tools to prevent ambiguous references in lemma	24
\arrangementX@threecol: Correct bug with paragraphed familiar footnotes setting.	178
\endsub: Restore subline feature (disabled by mistake in v1.8.0).	100
\if@lemmacommand@: New boolean \iflemmacommand@.	110
v1.15.1.	
\line@list@stuff: Revert modification of 1.5.2 which makes bug with numbering.	
Leave vertical mode to solve spurious space before minipage.	98
v1.16.0.	
General: \edtext is now defined only in elemac, not in elepar. Debug wrong numbering when using \sameword + elepar + \tag command.	105
Compatibility of standard footnotes with some biblatex styles.	1
New \stanzaindent command.	1
v1.16.1.	
\edlineref: \lineref is not defined if defined by some other package, like lineno.	
Elemac provides \edlineref instead.	217
v1.17.0.	
\edtext: Error message when calling \edtext outside of a numbered paragraph. . . .	105
v1.18.0.	
\@edindex@hyperref: Fix spurious space with \edindex when using imakeidx/indextools + hyperref.	237
General: Add \Xpstarteverytime	31
Compatibility with Lua ^{TEX} RTL languages.	1
Debug \Xonlypstart when using \Xnumberonlyfirstinline and the current line number differs from the previous.	31
\edlabel: \edlabel is now defined only one time for both elemac and elepar .	213
\ifledRcol@: Add \ifl@dprintingpages and \odprintingcolumns for elepar .	67
\l@d@section: Option parapparatus works for endnotes.	187
\print@line: Compatibility with Lua ^{TEX} RTL languages.	123
\printlinefootnote: Code refactoring in \printlinefootnote: the printing of the numbers are factorized in \printlinefootnotearea	158
\printpststart: Debug \Xpstart with parallel pages and columns (elepar)	158
v1.19.0.	
General: \Xmaxhnotes and \maxhnotesX work now for both two-columns and three-columns setting.	1
Compatibility with elepar v.1.13.0.	1
\footsplitskips: \footsplitskips doesn't set \floatingpenalty to \@MM when processing parallel pages.	139
\xxref: \xxref works also with right side numbers, when \Rlineflag is not empty. .	219
v1.19.1.	
General: Call \correct@footinsX@box and \correct@Xfootins@box directly in \print@notesX@forpages and \print@Xnotes@forpages, that is in elepar.	1
v1.20.0.	
General: Add \Xendboxlinenum	33
Add \Xtwolines and \Xmorethanwolines hooks	30
Add series option.	1
Correct \Xinplaceofnumber hook.	1
Explicit error message when calling \Xfootnote outside of \edtext.	1
Fix bug with line number typesetting direction when using \eleddsection and similar commands for RTL texts with Lua ^{TEX}	1
Fix issues with RTL text in notes when using Lua ^{TEX}	1

Options fulllines in <code>\Xfootnote</code>	22
The <code>\newifs</code> are not followed by boolean values set to false, because it is the TeX default setting.	1
<code>\printlines</code> : Added <code>\ifl@d@Xmorethantwolines</code> and <code>\ifl@d@Xmorethantwolines</code> to <code>\printlines</code>	165
<code>\stanza</code> : & and & can be preceded by spaces.	244
<code>\xxref</code> : Debug <code>\xxref</code> when not loading <code>eledpar</code> (fix bug added in 1.19.0).	219
v1.21.0.	
<code>\@edindex@hyperref</code> : Look at the hyperindex option of <code>hyperref</code> before inserting <code>hyperref</code>	237
General: <code>\AtEveryPstart</code> and <code>\AtEveryPend</code> are now compatible with <code>\autopar</code>	1
<code>\Xafterrule</code> and <code>\afterruleX</code> features no longer create problems of overflowing at the bottom of the page.	1
<code>\chapter</code> inside optional argument of <code>\pstart</code> works when typesetting parallel pages	1
<code>\preXnotes</code> and <code>\prenotesX</code> features no longer create problems of overflowing at the bottom of the page.	1
<code>\seriesatbegin</code> and <code>\seriesatbegin</code> more efficient	200
Add <code>\applabel</code> and related	44
Add <code>\beforenotesX</code> and <code>\Xbeforenotes</code> features for notes set in two and three column.	1
Add <code>\hidenumbering</code>	20
Add <code>\Xcolalign</code> and <code>\colalignX</code> hooks	35
Add <code>\Xendtwolines</code> , <code>\Xendmorethantwolines</code> , <code>\Xendtwolinesbutnotmore</code> and <code>\Xendtwolinesonlyinsamepage</code>	30
Add <code>\Xparindent</code> and <code>\hangindentX</code>	34
Add <code>\Xtwolinesbutnotmore</code> and <code>\Xtwolinesonlyinsamepage</code>	1
Add <code>nocritical</code> , <code>noend</code> , <code>nofamiliar</code> and <code>noledgroup</code> options.	1
Add <code>noledsec</code> package option	1
Debug <code>\beforenotesX</code> <code>\maxhnotesX</code> <code>\noteswidthliketwocolumnsX</code> and <code>\afterruleX</code> with footnotes set in two and three columns.	1
Fix bug when a <code>\Xfootnote</code> follows a <code>\Xendnote</code> in the second argument of <code>\edtext</code> (bug added in <code>eledmac</code> 1.0.0)	1
Fix bug with <code>\maxhnotesX</code> when using <code>\foottwocolX</code> or <code>\footthreecolX</code>	1
Fix bug with space between columns with notes in two columns (bug added in v1.13.0).	1
Fix spurious space after first page number in <code>\doendnotes</code> . <code>oldprintnpnumspace</code> option allows to come back to previous setting	1
parapparatus option works now with familiar footnotes.	1
Provide <code>\@gobblefive</code>	67
<code>\l@d@section</code> : <code>\endnotes</code> take five arguments.	187
<code>\ledinnotemark</code> : Add <code>\ledinnotemark</code>	235
<code>\ledsetnormalparstuffX</code> : <code>\ledsetnormalparstuff</code> is deprecated and becomes <code>\ledsetnormalparstuffX</code> and <code>\Xledsetnormalparstuff</code>	182
<code>\n@num</code> : <code>\n@num@ref</code> deleted	94
<code>\n@num</code> defined only one time for both <code>Eledmac</code> and <code>Eledpar</code>	94
<code>\newhookcommand@series</code> : <code>\newhookcommand@series</code> can take an optional argument.	203
<code>\newhooktoggle@series</code> : <code>\newhooktoggle@series</code> can take an optional argument.	204
<code>\print@footnoterule</code> : Code refactoring: the spaces after the footnote rules are directly managed in <code>\print@Xfootnoterule</code> and <code>\print@footnoteXrule</code>	184

\seriesatend: Fix spurious space in \seriesatend	200
\skipnumbering: \skipnumbering defined only one time for both Eledmac and Eledpar.	101
.	101
Correct \skipnumbering for stanza.	101
Delete \skipnumbering@reg.	101
v1.22.0.	
General: Add \doendnotesbysection command.	22
Add option for lemma separator inside endnotes	33
Adds hyperlink for references to notes in indices.	1
Fix conflict between noend package option and edtabularx environments	1
Provides support for xindy.	1
Standardize endnotes handbook.	22
When using hyperref package, internal links in index or with \edlineref are now targeted to the top and not longer to the bottom of the lines they refer to.	1
\ledinnote: \ledinnote takes a first optional argument, which is the label for hyperlinks.	235
v1.22.1.	
General: Fix bug (added on v1.22.0) with \Xinplaceofnumber hook.	1
\prevpage@num: Correct double symbol when using both \parafootsep and \Xsymlinenum.	151
.	
v1.23.0.	
@edtext@level: The boolean \if@edtext@ becomes the counter \edtext@level.	105
General: Add \Xboxlinenumalign and \Xendboxlinenumalign.	32
Add \Xboxstartlinenum, \Xendboxstartlinenum, \Xboxendlinenum, \Xendboxendlinenum.	32
Allow use of \sameword with inputenc managing of UTF-8.	1
Compatibility between nofamiliar/nocriticals option and minipage/ledgroup.	1
Error message when using \beginnumbering... \endnumbering without \pstart.	1
Fix bug with \sameword when the lemma overlaps multiple line.	24
Fix bug with \sameword when the same lemma is used for multiple notes or for nested \edtexts.	24
Fix bug with \skipnumbering called immediately after a \pstart.	1
Fix error of \iftrue not closed.	1
Fix spurious space with \skipnumbering (bug added on v1.21.0).	1
New tools to ensure the line-list file uses the right version of commands when upgrading the eledmac version.	1
Optional argument of \sameword can be a comma separated list of \edtext depth.	24
\lemma: Fix spurious space after \lemma command	109
\newseries@: Prevent spurious spaces when \Afootnote and similar commands are followed by spaces (bug added on 1.0.0).	195
\sameword: In order to allow use of \sameword with inputenc, we detokenize its mandatory argument before using it in control sequence names.	113
v1.23.1.	
General: Fix bug with \lemma command in the right side.	1
v1.23.2.	
General: Compatibility with L ^A T _E X's release 2015.	1
v1.24.0.	
General: We can reinitialize \AtEveryPstart and \AtEveryPend providing to it an empty argument.	1

v1.24.1.		
General: \lemma is disabled when using ‘nocritical’ option.	1	
v1.24.2.		
General: Fix incompatibility between ‘nofamiliar’ option and ‘memoir’ package.	1	
v1.24.3.		
General: Restore marginal numbers and notes with sectioning command (bug introduced in v1.21.0)	1	
v1.24.4.		
General: Fix spurious space with \edindex when using xindy+hyperref option.	1	
v1.24.5.		
General: Fix bug of indent, when a added in 1.1.0, when a \beginnumbering immediately follow a sectioning command.	1	
v2.0.0.		
\@iiminipage: Patch \@iiminipage instead of redefining it.	230	
\@xypar: Patching \@xypar instead of redefining it	222	
General: \@makecol, \@reinserts and \@doclearpage are patched instead of begin redefined	211	
\doxtrafeeti becomes \do@feetX; \doxtrafeetii becomes \Xdo@feet; \@opxtrafeeti becomes \@opfeetX; \doreinxtrafeetii becomes \X@doreinfeet; \doreinxtrafeeti becomes \@doreinfeetX.	211	
Add \Xendinplaceofnumber hook.	1	
Add \Xendnonumber hook.	1	
Add nonum option for endnotes.	1	
Fix bug when printing only one series of endnotes, but wanted to keep endnotes for other series.	1	
In order to have a more consistent name’s convention, many names has been changed.	1	
Many L ^A T _E X’s output macros are now patched and not override.	1	
Package’s name becomes reledmac .	1	
Patch \@footnotemark instead of redefine it	167	
Suppress indexing command specific to memoir.	236	
\endminipage: Patch \endminipage instead of redefining it.	230	
\initnumbering@quote: \initnumbering@sectcmd becomes \initnumbering@quote	268	
\l@advance@parledgroup@beforenormalnotes: Some conde of \l@dumboxmpfoot moved to \l@advance@parledgroup@beforenormalnotes	230	
\newseries@: One endnotes file by series.	198	
v2.0.1.		
General: Fix bug in elecmac-compat option	1	
Fix incompatibility between optional argument of \pstart and \numberpstarttrue	1	
v2.1.0.		
General: Fix bug with \advanceline at the begin of a \pstart.	1	
Fix bug with \chapter in optional argument of \pstart in parallel typesetting with scrbook.	1	
Fix bug with \eledchapter in parallel typesetting with scrbook.	1	
Fix bug with \setline at the begin of a \pstart.	1	
Fix space bug with \Xbhooknote and \bhooknoteX when using to insert text and not to execute code.	1	
New tools to number stanza	1	
v2.1.1.		
General: Fix bug with \ledpbsetting{before}.	1	

v2.1.2.

General: Fix bug with lineation by pstart and tabular environment (added in 2.1.0). . . . 1
