1 Introduction

Repeating of math operator at the broken line and the new line in inline equations is used in Cyrillic mathematical typography (Russian for example), but unfortunately L^AT_EX doesn't provide such an option. There was an attempt to do it many years ago [see M.I. Grinchuk "TeX and Russian Traditions of Typesetting", TUGboat 17(4) (1996) 385], but there was no ready to use package.

This package extends ideas described in "TeX and Russian Traditions of Typesetting" and supports most of L^AT_EX mathematical packages (some known issues are listed in "Known issues" section below).

2 Usage

Just include the package using `\usepackage{rmathbr}` command.

$$\begin{aligned} (a+b)^2 &= a^2 + a^3 \pm b^3 = + 2x + 3x^2 + = a^{-2}(\sin ax - \cdot \vec{t}_2, x = 12 \times \\ &+ 2ab + b^2, = (a \pm b) \times + \dots, \sin^2 \alpha + - ax \cos ax), \times 3 \cdot 10^3. \\ a^2 - b^2 &= (a + \times (a^2 \mp ab + b^2), + \cos^2 \alpha = 1, t_1 t_2 \cos \theta = \vec{t}_1 \cdot \\ &+ b) (a - b), (1-x)^{-2} = 1 + \int x \sin ax dx = \end{aligned}$$

It's recommended to load `rmathbr` after other packages, because of `rmathbr` has special support of many math-related packages: `amsfonts`, `amssymb`, `amstex`,

boisik, euler, eulervm, fourier, icomma, latexsym, lucbmath, lucidabr, lucmin, lucmtime, luctime, mathbbol, mdwmath, program, sbbm, stmaryrd, wasysym.

Please, submit any found bugs to <https://github.com/dryabov/rmathbr/issues>.

3 Options

The `rmathbr` package supports following options:

- `mathactivechars` (default): assign mathactive (12) category to `^` and `_` characters.
- `activechars`: assign active (13) category to `^` and `_` characters.
- `noactivechars`: assign default categories to `^` and `_` characters (7 and 8, correspondingly).

In some cases it might be necessary to change default option for compatibility with other packages.

4 Macros

`*`

Macro `*` is used to mark multiplication point that is invisible and changed to `\times` at break only. E.g. `(a+b)*(a-b)`.

`\cdott`

This command displays `\cdot` (.) that is changed to `\times` at break.

`\nobr`

This command is used to prevent break expression on the following math operator. E.g. `a\nobr-b`.

`\SetBreakableBin`

Declares breakable binary operator, e.g. `\SetBreakableBin{\MyPlus}`.

`\SetBreakableRel`

Declares breakable relation operator, e.g. `\SetBreakableRel{\MyEqual}`.

`\SetBreakableInner`

Declares breakable “inner” expression, e.g. `\SetBreakableInner{\ldots}`.

`\SetOpenBracket`

Declares opening bracket (`rmathbr` disables break directly after brackets), e.g. `\SetOpenBracket{\MyOpenBracket}`.

`\SetMathOperator`

Declares math operator (`rmathbr` disables break directly after operators), e.g. `\SetMathOperator{\MySum}`.

`\SetPunctuation`

Declares punctuation command (`rmathbr` disables break directly after punctuation), e.g. `\SetPunctuation{\MyColon}`.

5 Known issues

- ‘xy’ package: should be loaded after ‘`rmathbr`’ to work properly
- ‘breqn’ package: cannot work together with ‘`rmathbr`’

23 `\binoppenalty=14141`

First symbol in equation is nonbreakable.
