

# The `showexpl` package\*

Rolf Niepraschk (`Rolf.Niepraschk@gmx.de`)

2016/11/20

## 1 Introduction

The documentation of a L<sup>A</sup>T<sub>E</sub>X package is by far more readable if there are examples of the commands' and environments' usage. The best way to do that is to give a comparison of the L<sup>A</sup>T<sub>E</sub>X code and the formatted output. `showexpl` is a package for doing that comparison, it is based on the package `listings` which provides a good typesetted source code with emphasised keywords and so on.

## 2 Usage

You can use `showexpl` like every other package by putting the line

```
\usepackage{showexpl}
```

in your source code. `showexpl` doesn't know any options by itself, but all options for the underlying packages (`listings` and `graphicx`) will be passed to the respective packages.

`showexpl` provides one command and one environment:

- `\LTXinputExample` and
- `LTXexample`

`\LTXinputExample` The syntax of `\LTXinputExample` is given by

```
\LTXinputExample[<key val list>]{<file>}
```

`LTXexample` The syntax of the environment `LTXexample` is given by

```
\begin{LTXexample}[<key val list>]... \end{LTXexample}
```

The set of options represented by `<key val list>` is the same for both the command and the environment, the options are described in the following:

**attachfile** Boolean valued key, default value: false. If set to true the sourcecode will be attached to the `.pdf` file—presumed that the document is processed by `pdflatex`.

**codefile** Name of the (temporary) file that contains the code which will be formatted as source code. The default value is `\jobname.tmp`.

---

\*This document corresponds to `showexpl` v0.3n, dated 2016/11/20.

**explpreset** A  $\langle key\ val\ list \rangle$  which serves for presetting the properties of the formatting of the source code, for values see the documentation of the `listings` package. The default value is

**graphic** Name of a (graphic) file. This file—if present—will be included and displayed instead of the formatted code. The default value is empty.

**hsep** Defines the horizontal distance between the source code and the formatted text.

**justification** Defines the justification of the formatted text: reasonable values are `\raggedleft`, `\raggedright`, `\centering`. The default value is `\raggedright`.

**overhang** A *dimen*-value that defines the amount by which the formatted text and the source code can overlap the print space. The default value is 0 pt.

**pos:** Defines the relative position of the formatted text relating to the source code. Allowed values are `t`, `b`, `l`, `r`, `o`, and `i` for top, bottom, left, right, outer, and inner. The last values give sense only for two-sided printing, where there are outer and inner margins of a page. The default value is `l`.

**preset** Any TeX code executed before the sample code but not visible in the `listings` area.

**rangeaccept** Boolean valued key, default value is false. If set to true, one can define ranges of lines that will be excerpted from the source code.

**rframe** Defines the form of the frame around the formatted text. With a non-empty value (e.g. “single”) a simple frame will be drawn. In the future more kinds of frames will be supported. The default value is empty (no frame).

**varwidth** Boolean valued key, default value is false. If set to true, the formatted text is set with its “natural” width instead of a fixed width as given by the value of the option `width`.

**vsep** Defines the vertical distance between the source code and the formatted text.

**wide** Boolean valued key, default value is false. If set to true, the source code and the formatted text overlap the print space and the margin area.

**width** A  $\langle dimen \rangle$  value that defines the width of the formatted text. The default value depends of the relative positions of the source code and the formatted text.

**scaled** Without a value the formatted text will be scaled to fit the given width of the result area. With a number as value the formatted text will be scaled by this number.

In addition to these options the kind of the result box (default: `\fbox`) can be changed. For example:

```
\renewcommand{\ResultBox}{\fcolorbox{green}{lightgray}{}
\setlength{\ResultBoxSep}{5mm}
\setlength{\ResultBoxRule}{2mm}}
```

### 3 Implementation

```
1 \DeclareOption{final}{%
2   \PassOptionsToPackage{\CurrentOption}{graphicx}%
3   \PassOptionsToPackage{\CurrentOption}{listings}%
4 }%
5 \DeclareOption{draft}{%
6   \PassOptionsToPackage{\CurrentOption}{graphicx}%
7   \PassOptionsToPackage{\CurrentOption}{listings}%
8 }%
9 \DeclareOption{attachfiles}{%
10  \AtBeginDocument{\IfFileExists{attachfile.sty}{%
11    \RequirePackage{attachfile}}{\def\SX@attachfile{}}}}
12 }%
13 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{listings}}
14 \ProcessOptions\relax
15 \RequirePackage{listings,calc,ifthen,graphicx,varwidth}
```

We must activate code from package `listings` for writing files.

\SX@defaultWD Parameter #2 is a length or a number. Parameter #1 is a macro. After a call of \SX@defaultWD this macro contains the value of the length or the value of the number multiplied by \linewidth.

```
17 \newcommand*\SX@defaultWD[2]{%
18   \afterassignment\SX@def@WD\dimen@#2\linewidth\relax{#1}}
19 \newcommand*\SX@def@WD{%
20 \def\SX@def@WD#1\relax#2{\edef#2{\the\dimen@}}}
```

Additional keys.

```

362 }

```

Changing the defaults possible in `showexpl.cfg`.

363 \InputIfFileExists{showexpl.cfg}{}{}

## Change History

v0.1a	“varwidth” package used (RN). . .	6	
General: “hpos” and “vpos” added, “pos” removed (RN). . .	3		
Initial version . . . . .	1		
v0.1b	\SX@put@t/b/l/r/o/i: Positioning the captions more independent of the result and code area (RN). . . . .	5	
v0.1c	\SX@put@t/b/l/r/o/i: Commands \SX@KillAboveCaptionskip and \SX@KillBelowCaptionskip added (RN). . . . .	5	
v0.1f	General: “lspreset” added. (RN). . .	3	
v0.1h	General: “codefile” added. (RN). . . “lspreset” renamed to “explpreset” (RN). . . . .	3	
	New macro \LTXinputExample (RN). . . . .	10	
	Renamed from “example” to “LTXexample” (RN). . . . .	6	
v0.1i	General: Better caption positioning and correct distance between the parts (RN). . . . .	6	
v0.1j	\SX@input: For ranges of lines (RN). . . . .	8	
	General: “rangeaccept” added (RN). . . . .	3	
v0.1k	\SX@put@t/b/l/r/o/i: Change [a]bove to [t]op (RN). . . . .	5	
	General: Some bug corrections (RN). . . . .	3	
v0.1l	General: “graphic” added (RN). . .	3	
v0.1m	General: Problem related to \label/\ref solved (RN). . . .	6	
v0.2a	General: “varwidth” and “justification” added (RN). . .	3	
v0.2b	General: Check if \SX@put@? is defined (RN). . . . .	6	
v0.3a	\SX@attachfile: Attach file functionality (with pdfTEX) added (RN). . . . .	5	
	General: “attachfile” added (RN). . .	3	
v0.3b	\SX@resultInput: Input of result code now inside a group; \makeatother added (RN). . . .	9	
v0.3c	\SX@resultInput: Wrong catcode for newline char corrected (RN). . . . .	9	
v0.3d	\SX@resultInput: Missing \par added (RN). . . . .	9	
v0.3e	\SX@@preset: More redefinitions added (RN). . . . .	4	
v0.3g	General: \SX@ProcessResult is now working correctly using \readline and \scantokens. Thanks to Ulrich Diez for help (RN). . . . .	8	
	Missing \newcommand for \SX@explpreset added (RN). . .	4	
v0.3h	General: New Option ‘attachfiles’ (RN). . . . .	3	
v0.3j	\SX@put@code@result: Setting \lstd@MakeCaption to was a bad idea for hyperlinks. Group added to varwidth environment. (Suggestions by Ulrike Fischer.). . . . .	7	
v0.3k	\SX@put@code@result: Setting \lstd@MakeCaption to \gobble again (prevent multiply defined labels; label key) . . . . .	7	

General: Definition for “hyperref” (suggested by Heiko Oberdiek)	10	assignement for <code>\lst@belowskip</code> (RN) . . . . .	7	
v0.3l		v0.3n		
<code>\SX@resultInput</code> : Code for “scaled” option (RN) . . . . .	9	<code>\SX@put@code@result</code> : Use <code>\ResultBox</code> . . . . .	7	
General: Option “scaled” and <code>\SX@scaled</code> added (RN) . . . . .	3	General: Define <code>\ResultBox</code> etc. . . . .	3	
v0.3m			Prevent utf8 encoding errors . . . . .	6
<code>\SX@put@code@result</code> : Wrong				

## Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
