

siunitx — A comprehensive (SI) units package*

Joseph Wright[†]

Released 2008/06/23

Abstract

Typesetting values with units requires care to ensure that the combined mathematical meaning of the value plus unit combination is clear. In particular, the SI units system lays down a consistent set of units with rules on how these are to be used. However, different countries and publishers have differing conventions on the exact appearance of numbers (and units).

The *siunitx* provides a set of tools for authors to typeset numbers and units in a consistent way. The package has an extended set of configuration options which make it possible to follow varying typographic conventions with the same input syntax. The package includes automated processing of numbers and units, and the ability to control tabular alignment of numbers.

A number of L^AT_EX packages have been developed in the past for formatting units: *Slunits*, *Slistyle*, *unitsdef*, *units*, *fancyunits* and *fancynum*. Support for users of all of these packages is available as emulation modules in *siunitx*. In addition, *siunitx* can carry out many of the functions of the *dcolumn*, *rccol* and *numprint* packages.

Part I

Introduction

The correct application of units of measurement is very important in technical applications. For this reason, carefully-crafted definitions of a coherent units system have been laid down by the *Conférence Générale des Poids et Mesures*¹ (CGPM): this has resulted in the *Système International d'Unités*² (SI). At the same time, typographic conventions for correctly displaying both numbers and units exist to ensure that no loss of meaning occurs in printed matter.

`siunitx` aims to provide a unified method for L^AT_EX users to typeset units and values correctly and easily. The design philosophy of `siunitx` is to follow the agreed rules by default, but to allow variation through option settings. In this way, users can use `siunitx` to follow the requirements of publishers, co-authors, universities, *etc.* without needing to alter the input at all.

`siunitx` is intended as a complete replacement for `Slunits`, `Slstyle`, `unitsdef`, `units`, `fancyunits` and `fancynum`. As such, emulation modes are provided for all of these packages. Where possible, conventions from the existing solutions have been used here. For example, the macros `\num`, `\ang` and `\SI` act in a very similar fashion to those in existing packages.

¹General Conference on Weights and Measures.
²International System of Units.

Part II

Using the `siunitx` package

1 For the impatient

`siunitx` provides the user macros:

- `\SI[options]{value}[pre-unit]{unit}`
- `\si[options]{unit}`
- `\num[options]{number}`
- `\ang[options]{angle}`
- `\sisetup{options}`

plus the `S` and `s` column types for decimal alignments and units in tables. These macros are designed for typesetting units and values with control of appearance and with intelligent processing.

By default, all text is typeset in the current upright, serif maths font. This can be changes by setting the appropriate package options: `obeyall` will use the current font for typesetting.

The package includes a “unit processor”, which allows the use of named units or literal values. Named units are processed to correctly include powers.

```
\SI{10}{\gram} \\
\SI{23.4}{g.cm^3} \\
\num{1e34} \\
\ang{1;2;3} \\
\emph{\SI{16,7}{metre\per\second}} \\
\textbf{\SI{30e3}{Hz}} \\
\SI{1.2 x 3.56 x 9.2}{millimetres} \\
\sisetup{obeyall} \\
\textbf{\SI{-4.5}{cm}} \\
\si{\joule\per\mole\per\kelvin} \\
\si[per=frac]{\joule\per\mole\per\kelvin} \\
\num[dp=4]{1.23456} \\
\num[dp=4]{9.8} \\
\begin{tabular}{S[tabformat=3.2]} \\
\toprule \\
{Heading} \\
\midrule \\
1.3 \\
134.2 \\
3.56 \\
74.7 \\
\bottomrule \\
\end{tabular}
```

2 Requirements

siunitx requires a reasonably up to date TeX system. The package requires ε-TEx-extensions, which should be available on most systems.³ The following packages are also needed:

- `array` and `xspace`: from the tools bundle, which should be available to everyone;
- `xkeyval`: this processes the option handling, and needs to be at least v2.5;
- `amstext`: from the *AMSTEX* support bundle (the *AMS* fonts are also needed to provide the default upright μ).

Hopefully most people using the package will have access to all of those items.

To use the `fraction=sfrac` option, the `xfrac` package is needed. This needs various experimental LATEX3 packages. As a result, siunitx does not load `xfrac`. If you want to use `fraction=sfrac`, you need to load `xfrac` in your preamble before `siunitx`.⁴ If the package is not loaded, `fraction=sfrac` falls back on a nicefrac-like method. The interested user should look at the `xfrac` documentation for reasons this might not be ideal.⁵

3 Loading the package

siunitx is loaded by the usual LATEX method.

```
\usepackage[<options>]{siunitx}
```

As is shown in the example, the package can be loaded with one or more options, using the key–value system. The full range of package options are described in Section 10; some options are described in the along with the appropriate user macros. Most of the user macros accept the same key–value settings as an optional argument.

4 Numbers

`\num` Numbers are automatically formatted by the `\num` macro. This takes one optional and one mandatory argument: `\num[<options>]{<number>}`. The contents of `<number>` are automatically formatted, in a similar method to that used by `numprint`. The formatter removes “hard” spaces (`\,` and `~`), automatically identifies exponents (by default marked using `e` or `d`) and adds the appropriate spacing of large numbers. A leading zero is added before a decimal marker, if needed: both `.”` and `,”` are recognised as decimal marker.

³If you have an old LATEX try “elatex” rather than “latex”.

⁴This document has been compiled in this way. You have to load `xfrac` first as otherwise very nasty things happen with `xkeyval`. MiKTEX users should note that the packaged versions of `expl3`, `template` and `xparse` will not work with `xfrac`: download copies from CTAN!

⁵On the other hand, some fractional units will look really bad with `\sfrac`. Use this option with caution.

1 123 1234 12345	<code>\num{1} \num{123} \num{1234} \num{12345} \\</code>
0.1 0.123 0.1234 0.12345	<code>\num{0.1} \num{0.123} \num{0,1234} \num{.12345} \\</code>
1×10^{10} 3.45×10^{-4} -10^{10}	<code>\num{1e10} \num{3.45d-4} \num{-e10}</code>

Various error-checking systems are built into the package, so that if $\langle number \rangle$ does not contain any numeric characters, a warning is issued. Isolated signs are also detected. The package recognises (and) as “extra” characters, which can be used to indicate the error in a number.⁶ The `seperr` causes this data to be given as a separate error value. If the number also contains an exponent, then brackets are re-added after the separation to ensure that meaning is not lost.

$1.234(5) = 1.234 \pm 0.005$	<code>\$\num{1.234(5)} = \num[seperr]{1.234(5)}\$ \\</code>
$1.234(5) \times 10^6 = (1.234 \pm 0.005) \times 10^6$	<code>\$\num{1.234(5)e6} = \num[seperr]{1.234(5)e6}\$</code>

The same applies to the unit and value macro `\SI`, described later, for example the rest mass of an electron [1]:

$m_e = 9.109\,389\,7(54) \times 10^{-31} \text{ kg}$	<code>\$ m_{\mathrm{e}} \\ = \SI{9.1093897(54)e-31}{\mathrm{kg}} \$ \\</code>
$m_e = (9.109\,389\,7 \pm 0.000\,005\,4) \times 10^{-31} \text{ kg}$	<code>\$ m_{\mathrm{e}} \\ = \SI[seperr]{9.1093897(54)e-31}{\mathrm{kg}} \$</code>

A number of effects are available as options. These are fully explained in Section 10. Some of the more useful options are illustrated here. By default, the output of the package is typeset in maths mode. However, the use of the current text font can be forced.⁷

1234 567 890	<code>\num{1234567890} \num[mode=text]{1234567890}</code>
--------------	---

`siunitx` can automatically add zeros and signs to numbers. This can be altered as desired.

1 1.0	<code>\num{1.} \num[padnumber=all]{1.} \\</code>
2 +2	<code>\num{2} \num[addsign=all]{2} \\</code>
$3 \times 10^4 + 3 \times 10^4 + 3 \times 10^{+4}$	<code>\num{3e4} \num[addsign=mant]{3e4} \num[addsign=all]{3e4} \\</code>
0.5 .5	<code>\num{.5} \num[padnumber=none]{.5}</code>

The separation of digits can be turned on and off, and the output changed.

1234 1 234	<code>\num{1234} \num[sepfour=true]{1234} \\</code>
12 345 12,345	<code>\num{12345} \num[digitsep=comma]{12345} \\</code>
12345	<code>\num[digitsep=none]{12345}</code>

The formatting of exponents is also customisable.

1×10^{10}	<code>\num{1e10} \num[expproduct=cdot]{1e10} \\</code>
2×10^{20}	<code>\num{2e20} \num[expbase=5]{2e20} \\</code>
3×10^{30}	<code>\num{3e30} \num[expproduct=tighttimes]{3e30}</code>

`siunitx` can automatically add colour to negative numbers, which is often useful for highlighting purposes. This is turned on with the `colourneg` option; the colour used is set by `negcolour`. Both of these are available with the US spellings: `colorneg` and `negcolor`.

⁶This is common in chemical crystallography, for example.

⁷This document is typeset using lowercase numbers in text mode, which emphasises the effect here.

```

-1                               \num{-1} \\
-2                               \sisetup{colourneg} \num{-2} \\
3 × 10-3                   \num{3e-3} \\
-4                               \num[negcolour=blue]{-4}

```

`siunitx` can automatically zero-fill and round to a fixed number of decimal places. This is controlled by two options `fixdp` and `dp`. The latter is an integer which specifies how many places to fix to; setting this option automatically sets `fixdp` to `true`. The place-fixing system will only alter pure numbers: for example, any error component will result in the input being left unchanged.

1.234 56	\num{1.23456} \\
1.23	\sisetup{dp=2} \\
9.80	\num{1.23456} \\
-10.43	\num{9.8} \\
44.3221(2)	\num{-10.432} \\
	\num{44.3221 (2) }

5 Tabular material

5.1 Aligning numbers

Centring numbers in tabular content is handled by a new column type, the `S` column. This is based closely on the `dcolumn` method for centring numbers in columns, but adds the functionality of the `\num` macro.⁸

By default, the decimal marker of the number is placed at the centre of the column, which then resizes to accommodate the width of the contents ([Table 1](#)). This behaviour is set by the `tabnumalign=centredecimal` option. By setting the `tabnumalign` option to `centre`, the centre of the space reserved for the number is placed at the centre of the column. The space reserved is stored in `tabformat`, which is of the form `<before><dec><after>`, where `<before>` is the number of characters before the decimal marker and `<after>` is the number after. Thus in the example, `tabformat=2.4` provides space for two digits before the decimal marker and four after. `tabnumalign` can also be set to `left` and `right`, with the expected results.

```

\begin{table}
\caption{Behaviour of \texttt{S} column type}
\label{tab:default}
\centering
\begin{tabular}{%
S%
S[tabnumalign=centre,tabformat=2.4]%
S[tabnumalign=right,tabformat=2.4]%
S[tabnumalign=centre,tabformat=2.4,decimalsymbol=comma]%
}
\toprule
{Some Values} & {Some Values} & {Some Values} & {Some Values} \\
\midrule
2.3456 & 2.3456 & 2.3456 & 2.3456 \\
34.2345 & 34.2345 & 34.2345 & 34.2345 \\

```

⁸The approach used is actually a combination of `dcolumn` for centring the material and `numprint` for processing it. It will therefore give rather different results than the `n` and `N` column types in `numprint`.

Table 1: Behaviour of S column type

Some Values	Some Values	Some Values	Some Values
2.3456	2.3456	2.3456	2,3456
34.2345	34.2345	34.2345	34,2345
56.7835	56.7835	56.7835	56,7835
90.473	90.473	90.473	90,473

```

56.7835 & 56.7835 & 56.7835 & 56.7835 \\
90.473 & 90.473 & 90.473 & 90.473 \\
\bottomrule
\end{tabular}
\end{table}

```

The `tabformat` setting can also be used to reserve space for numbers containing exponents. This is given in the same format as above, but with a mantissa and exponent part (Table 2). Notice that this is designed to expect that numbers will contain a mantissa. Exponents can either be aligned so that the “ \times ” symbols match up vertically, or the exponent part can be allowed to move across as needed. Space for signs is added by using any sign in the `tabformat`, so for example `tabformat=+2.2` and `tabformat=-2.2` have exactly the same effect. Setting `tabformat` will automatically switch from `tabnumalign` from `centredecimal` to `centre`, if the former is currently set. In other cases, the current alignment option is retained.

```

\begin{table}
\caption{Exponents in tables}
\label{tab:exptab}
\centering
\begin{tabular}{%
S[tabnumalign=right,tabformat=2.2e2]%
S[tabnumalign=centre,tabformat=2.2e1.1]%
S[tabnumalign=centre,tabformat=2.2e1.1,tabalignexp=false]%
S[tabnumalign=centre,tabformat=+2.2]%
}
\toprule
& {Longer values} \\
& {Longer values} \\
& {Longer values} \\
& {Values} \\
\midrule
2.3e1 & 2.34e1 & 2.34e1 & +2.31 \\
34.23e45 & 34.23e45 & 34.23e45 & 34.23 \\
56.78 & 56.78 & 56.78 & -56.78 \\
1.0e34 & 1.0e34 & 1.0e34 & +1.0 \\
\bottomrule
\end{tabular}
\end{table}

```

Data not to be processed as a number should be protected by wrapping it in braces: this is most likely to be true for column headers (again as illustrated). By default, the contents of non-numeric cells are centred. This can be altered by

Table 2: Exponents in tables

Longer values	Longer values	Longer values	Values
2.3×10^1	2.34×10^1	2.34×10^1	2.31
34.23×10^{45}	34.23×10^{45}	34.23×10^{45}	34.23
56.78	56.78	56.78	-56.78
1.0×10^{34}	1.0×10^{34}	1.0×10^{34}	± 1.0

Table 3: Number and units in tables

Value	Unit
2.16×10^{-5}	$\text{m}^2 \text{s}^{-1}$
2.83×10^{-6}	$\text{m}^2 \text{s}^{-1}$
7.39×10^3	$\text{Pa m}^3 \text{mol}^{-1}$
1.0×10^5	Pa

setting `tabtextalign`, which can be set to `left`, `right` or `centre`. The use of digit separators in table columns is accounted for: extra space is reserved if digit separators will be added.

5.2 Columns of units

As a complement to the `S` column, `siunitx` also provides a second column type, `s`. This is intended for producing columns of units. The letters chosen are intended to be similar to `\SI` and `\si`, respectively. The alignment of material in `s` columns is governed by the `tabunitalign` option.

```
\begin{table}
\centering
\caption{Number and units in tables}
\label{tab:num-unit}
\begin{tabular}{%
S [tabformat=1.2e-1,tabnumalign=centre] %
s [tabunitalign=left] }
\toprule
{Value} & \multicolumn{1}{c}{Unit} \\
\midrule
2.16e-5 & \metre\squared\per\second \\
2.83e-6 & \metre\squared\per\second \\
7.39e3 & \pascal\cubic\metre\per\mole \\
1.0e5 & \pascal \\
\bottomrule
\end{tabular}
\end{table}
```

6 Angles

\ang Angles can be typeset using the \ang command. This takes two arguments, \ang [⟨options⟩] {⟨angle⟩}, where ⟨options⟩ can be any of the package options to apply only to this value. ⟨angle⟩ can be given either as a decimal number or as a semi-colon separated list of degrees, minutes and seconds, i.e. \ang{⟨decimal angle⟩} or \ang{⟨degrees⟩;⟨minutes⟩;⟨seconds⟩}. By default, no space is introduced between angles and the degrees, minutes and seconds markers.

10° 12.3° 4.5°
1°2'3" 0°0'1"
10° -0°1'

```
\ang{10} \ang{12.3} \ang{4,5} \\
\ang{1;2;3} \ang{;;1} \\
\ang{+10;;} \ang{-0;1;}
```

By default, angles with no degrees (or minutes) are zero-filled; angles with degrees but no minutes or seconds are not filled. This behaviour can be altered using the package options.

0°0'1" 1"
2° 2°0'0"
0°3'0" 4°0'0" 0°0'5"

```
\ang{;;1} \ang[padangle=none]{;;1} \\
\ang{2;;} \ang[padangle=all]{2;;} \\
\sisetup[padangle=all] \ang{;3;} \ang{4;;} \ang{;;5}
```

The \num macro is used to typeset each number of the angle, so the options for \num also apply here. The anglesep value can be used to separate degrees, minutes and seconds.

1.05° 1,05°
3.678 90° 3.678,90°
9°8'7" 9°8'7"

```
\ang{1.05} \ang[decimalsymbol=comma]{1.05} \\
\ang{3.67890} \ang[digitsep=comma]{3.67890} \\
\ang{9;8;7} \ang[anglesep=thin]{9;8;7}
```

The degrees, minutes and seconds signs can be placed over the decimal sign using the astroang option. This is designed on the assumption that only the last number given has a decimal part.

1.2° 1.2
1°2.3' 1°2.3'
1°2'3.4" 1°2'3".4

```
\ang{1.2} \ang[astroang]{1.2} \\
\ang{1;2.3;} \ang[astroang]{1;2.3;} \\
\ang{1;2.3.4} \ang[astroang]{1;2.3.4}
```

7 Units and values

\SI The core aim of siunitx is correctly typesetting values which have units. The main output macro here is \SI, which has the same syntax as the macros with the same name in SISyle and unitsdef packages. The \SI macro takes two mandatory arguments, in addition to the optional set up argument, and a second optional argument: \SI [⟨options⟩] {⟨number⟩} [⟨preunit⟩] {⟨unit⟩}. The ⟨number⟩ argument operates in exactly the same manner as the equivalent argument of the \num macro. ⟨unit⟩ will be typeset with a non-breakable space between it and the preceding number, with font control as outlined earlier. Finally, ⟨preunit⟩ is a unit to be typeset *before* the numerical value (most likely to be a currency). Some examples illustrate the general power of the macro.

1.23 J mol⁻¹ K⁻¹
0.23 × 10⁷ cd
£1.99/kg
70 m s⁻¹
1.345 A/mol

```
\SI[mode=text]{1.23}{J.mol^{-1}.K^{-1}} \\
\SI{.23e7}{\candela} \\
\SI[perslash]{1.99}{\pounds \per kilogram} \\
\SI{70}{\metre \per \second} \\
\SI[per=frac,fraction=nice]{1,345}{\ampere \per \mole}
```

The use of unit macros outside of the `\SI` macro is described later.

7.1 Literal units

Units can be input in two ways, inspired by `Slstyle` and `Slunits`. The `Slstyle`-like method uses literal input. Four characters have a special meaning:

- “ $^$ ” The superscript character is used without the usual need for surrounding maths characters (`$`);
- “ $.$ ” and “ $,$ ”: the full stop (point) symbol and comma are made active, and produce the current contents of the `unitsep` option;
- “ \sim ” The contents of the `unitspace` option are typeset by a tilde.

This allows ready input of units.

10 kg m s^{-2}
 1.453 g/cm^3
 33.562 cd s
 100 m s^{-2}

```
\SI{10}{kg.m.s^{-2}}\\
\SI{1.453}{g/cm^3}\\
\SI{33.562}{cd~s}\\
\SI[unitsep=medium]{100}{m.s^{-2}}
```

The literal unit system will correctly typeset input containing the symbols μ (micro), $^\circ$ (degree) and \AA (ring-A).⁹

$10 \mu\text{m}$
 $20 {}^\circ\text{C}$
 30\AA

```
\SI{10}{\mu m}\\
\SI{20}{^{\circ}C}\\
\SI{30}{\text{\AA}}
```

7.2 The unit interpreter

The second operation mode for the `\SI` macro is based on the behaviour of `Slunits`. Here, each unit, SI multiple prefix and power is given a macro name. These are entered in a method very similar to the reading of the unit name in English.

10 kg m s^{-2}
 1.453 g cm^{-3}
 33.562 cd s
 100 m s^{-2}
 $4.56 \times 10^3 \text{ m s}^{-1}$

```
\SI{10}{\kilo\gram\metre\per\second\squared}\\
\SI{1.453}{\gram\per\cubic\centi\metre}\\
\SI{33.562}{\candela\second}\\
\SI[unitsep=thin]{100}{\metre\per\Square\second}\\
\SI[prefixsymbolic=false]{4.56}{\kilo\metre\per\second}
```

On its own, this is very similar to `Slunits`, and is less convenient than the direct input method.¹⁰ However, the package allows you to define new unit macros; a large number of pre-defined abbreviations are also supplied. More importantly, by defining macros for units, instead of literal values, new functionality is made available. Units may be re-defined to give different output, and handling of reciprocal values can be altered.

$10 \frac{\text{g m}}{\text{s}^2}$
 1.453 g/cm^3
 33.562 cd s
 100 m/s^2

```
\SI[per=frac,fraction=frac]{10}{\gram\metre\per\second\squared}\\
\SI[per=slash]{1.453}{\gram\per\cubic\centi\metre}\\
\SI{33.562}{\candela\second}\\
\SI[per=frac,fraction=nice]{100}{\metre\per\Square\second}
```

⁹Currently this works with `Xe`T_EX and `inputenc` using the `latin1`, `latin5` and `latin9` encodings.

¹⁰Users of `Slunits` should note the lack of need for a `\usk`-type macro.

The unit processor will trap *some* errors in the input and give the “best guess” result. However, it is down to the user to check the output.

7.3 Powers of units

\Square
\ssquare
\squared
\cubic
\cubed

Including powers in units is handled using a “natural language” method. Thus preceding a unit by \Square or \cubic which raise the unit to the appropriate power, while \squared or \cubed follow the unit they apply to. The \Square macro is capitalised to avoid a name clash with pstricks; the alternative \ssquare is also provided.

10 m^2	<code>\SI{10}{\metre\squared}\\"</code>
20 m^2	<code>\SI{20}{\Square\metre}\\"</code>
30 m^3	<code>\SI{30}{\metre\cubed}\\"</code>
40 m^3	<code>\SI{40}{\cubic\metre}</code>

\per The \per macro intelligently creates reciprocal powers, and also adds the power -1 when appropriate.

10 s^{-2}	<code>\SI{10}{\per\second\squared}\\"</code>
20 s^{-2}	<code>\SI{20}{\per\Square\second}\\"</code>
$30^{1/\text{s}^3}$	<code>\SI[per=frac,fraction=nice]{30}{\per\second\cubed}\\"</code>
$40/\text{s}^3$	<code>\SI[per=slash]{40}{\per\cubic\second}\\"</code>
50 s^{-1}	<code>\SI{50}{\per\second}\\"</code>
$60\text{ m}^{-1}\text{ cd}^2$	<code>\SI{60}{\per\metre\Square\candela}</code>

\tothe
\raiseto

For powers not defined above or with \newpower, the \tothe macro can be used “in line” to produce a power. As follows from standard English usage, this comes after the unit. \raiseto achieves the same, but is used *before* a unit to add a power *after*.¹¹

16.86 m^4	<code>\SI{16.86}{\metre\tothe{4}}\\"</code>
7.895 N^{-6}	<code>\SI{7.895}{\raiseto{-6}\newton}\\"</code>
1.34 K^{-7}	<code>\SI{1.34}{\per\kelvin\tothe{7}}\\"</code>

7.4 Units with no values

\si

For typesetting the symbol for a unit on its own, with the full font control and without extra spaces, the \si macro is provided.¹² The macro name avoids a clash with the functionality of the earlier packages, but is similar to \ilu from the unitsdef package.

kg m/s^2	<code>\SI{}{\kg.m/s^2}\\"</code>
kg m/s^2	<code>\si{\kg.m/s^2}\\"</code>
mol dm^{-3}	<code>\si[mode=text,unitsep=thin]{\mole\per\cubic\deci\metre}</code>

¹¹\raiseto acts in the same way as \tothe when used in a literal context: the power will be produced where the macro is, rather than moving after the next item.

¹²The same effect can be achieved using the \SI macro with an empty numerical argument.

Table 4: The seven base SI units

Unit	Macro	Symbol
kilogram	\kilogram	kg
metre	\metre	m
second	\second	s
mole	\mole	mol
\kelvin	K	
ampere	\ampere	A
candela	\candela	cd

7.5 Free-standing units

Users of the `unitsdef` package will be accustomed to using unit macros on their own (following a value) or with an optional argument containing a number. In both cases, only a single unit macro could be used. `siunitx` supports both operation modes, with the limitation that units trailing values loose font control of the value. When used in this way, the units *do not* take an optional `keyval` argument.

123 m	\sisetup{prespace,allowoptarg}
123 K	123\metre\\
234 A	\kelvin[123]\\
6 s	\sisetup{mode=text} \ampere[234]\\
	6\second

7.6 Pre-defined units, prefixes and powers

\metre The package always defines the seven base SI units, irrespective of any package options given (Table 4). The kilogram is notable as by default it is a *base* unit with a prefix. Thus, when the package is loaded with the option `load={}`, `\kilo` and `\gram` are not defined. As metre is often spelled as “meter” in the US, the macro `\meter` is provided in addition to the `\metre` macro.¹³

By default, a number of additional definitions are created by the package. These are controlled by the `load` and `noload` options. Unless specifically requested with the option `noload=prefix`, `siunitx` defines the standard prefixes for powers of ten (Table 5). This leads to the redefinition of `\kilogram` as `\kilo\gram`. The macro `\deka` is provided, as this is used as an alias for `\deca` in some places. The package also defines a number of derived SI units which have assigned names and symbols (Table 6). Note that `\Gray` is capitalised to avoid a name clash with the `pstricks` package.¹⁴

\litre In addition to these units, there are three other groups of units for use with the SI system which do not fit into the above. These are those derived from physical measurements (Table 7), those considered “accepted” (Table 8), and those accepted temporarily (Table 9).¹⁵ The unit “litre” is often spelled “liter”

¹³The official SI spelling for the unit is “metre”.

¹⁴The macros `\ohm` and `\celsius` are not defined by `siunitx` if the `gensymb` package is loaded.

¹⁵These are supposed to be replaced over time by SI units.

Table 5: The SI prefixes (`load=prefix`)

Prefix	Macro	Power	Symbol	Prefix	Macro	Power	Symbol
yocto	\yocto	10^{-24}	y	deca	\deca	10^1	da
zepto	\zepto	10^{-21}	z	hecto	\hecto	10^2	h
atto	\atto	10^{-18}	a	kilo	\kilo	10^3	k
femto	\femto	10^{-15}	f	mega	\mega	10^6	M
pico	\pico	10^{-12}	p	giga	\giga	10^9	G
nano	\nano	10^{-9}	n	tera	\tera	10^{12}	T
micro	\micro	10^{-6}	μ	peta	\peta	10^{15}	P
milli	\milli	10^{-3}	m	exa	\exa	10^{18}	E
centi	\centi	10^{-2}	c	zetta	\zetta	10^{21}	Z
deci	\deci	10^{-1}	d	yotta	\yotta	10^{24}	Y

Table 6: The derived SI units with defined names (`load=derived`)

Unit	Macro	Symbol	Unit	Macro	Symbol
becquerel	\becquerel	Bq	newton	\newton	N
celsius	\celsius	°C	ohm	\ohm	Ω
coulomb	\coulomb	C	pascal	\pascal	Pa

Gray	\Gray	Gy	siemens	\siemens	S
	\ggray	Gy	sievert	\sievert	Sv
hertz	\hertz	Hz	steradian	\steradian	sr
henry	\henry	H	tesla	\tesla	T
joule	\joule	J	volt	\volt	V
katal	\katal	kat	watt	\watt	W
lumen	\lumen	lm	weber	\weber	Wb
lux	\lux	lx			

Table 7: Units derived from experiments (`load=physical`)

Unit	Macro	Symbol
electron volt	<code>\electronvolt</code>	eV
unified atomic mass unit	<code>\atomicmassunit</code>	u
	<code>\atomicmass</code>	u

Table 8: Units accepted for use with SI (`load=accepted`)

Unit	Macro	Symbol
bel	<code>\bel</code>	B
day	<code>\Day</code>	d
	<code>\dday</code>	d
degree	<code>\degree</code>	°
hour	<code>\hour</code>	h
litre	<code>\litre</code>	l
	<code>\liter</code>	L
minute	<code>\minute</code>	min
minute (arc)	<code>\arcmin</code>	'
neper	<code>\neper</code>	Np
percent	<code>\percent</code>	%
second (arc)	<code>\arcsec</code>	"
tonne	<code>\tonne</code>	t

in the US; both spellings are provided by `siunitx`, with `\liter` giving L and `\litre` producing l.

7.7 Prefixed and abbreviated units

Many basic units have prefixes which are commonly used with the unit, such as centimetre or megahertz. The package therefore defines a number of common prefixed units (`load=prefixed`). Several of these also have obvious abbreviations (such as `\MHz` for `\megahertz`), which are made available by `load=abbr`. In common with the units discussed above, the prefixed and abbreviated unit definitions are loaded by default.

Table 10: Prefixed (`load=prefixed`) and abbreviated (`load=abbr`) units

Unit	Macro	Symbol	Abbreviation
<i>Masses</i>			
kilogram	<code>\kilogram</code>	kg	<code>\kg</code>

7.8 Defining new units

`\newunit`
`\renewunit`
`\provideunit`

New units are produced using the `\newunit` macro. This works as might be expected: `\newunit[⟨options⟩]{⟨unit⟩}{⟨symbol⟩}`, where `⟨symbol⟩` can contain literal values, other units, multiple prefixes, powers and `\per`. The `⟨options⟩` argument can be any suitable options, and applies the specific unit macro only. The most obvious example for using this macro is the `\degree` unit.¹⁶ The (first) optional argument to `\SI` and `\si` can be used to override the settings for the unit. The `\renewunit` and `\provideunit` macros take the same arguments.

3.1415°
12 345XXX 67 890 XXX

```
\SI{3.1415}{\degree} \\
\newunit[valuesep=none]{\oddunit}{XXX} \\
\SI{12345}{\oddunit} \\
\SI[valuesep=thick]{67890}{\oddunit}
```

As with the L^AT_EX commands `\newcommand`, etc., the choice of `\newunit`, `\renewunit` or `\provideunit` depends on the presence of an existing definition. While `\newunit` should be used when a unit has not been previously defined, `\renewunit` will issue a warning if the named unit does not already exist. `\provideunit` defines the unit if it does not exist, and otherwise does nothing at all. The same behaviour is seen with `\providemode` and `\provideprefix` (*vide infra*).

Output that is only valid in maths mode requires `\ensuremath`, text-only input requires `\text`. In the example below, `\mathnormal` is used to force the font choice only for the single character.¹⁷

10 m π^{-2}

```
\newunit{\SIpi}{\ensuremath{\mathnormal{\pi}}}
\SI{10}{\metre\per\SIpi\squared}
```

`\newpower`
`\renewpower`
`\providepower`

Powers are defined: `\newpower[post]{⟨power⟩}{⟨num⟩}`. Here, `⟨power⟩` is the name of the power macro and `⟨num⟩` is the (positive) number it represents.

¹⁶Although the `\ang` macro is preferred for this job.

¹⁷The `\mathrm` font used for this document has an “f” at the π position.

Table 11: Binary prefixes (alsoload=binary)

Prefix	Macro	Power	Symbol
kibi	\kibi	2^{10}	Ki
mebi	\mebi	2^{20}	Mi
gibi	\gibi	2^{30}	Gi
tebi	\tebi	2^{40}	Ti
pebi	\pebi	2^{50}	Pi
exbi	\exbi	2^{60}	Ei

The later argument is always processed internally by `\num`, but *must* be a number. Giving the optional argument `post` indicates to the package that the power will come after the unit it applies to; by default it is assumed that it will come before.

$\frac{\text{kg}^4}{\text{m}^4}$

```
\newpower{\quartic}{4}
\newpower[post]{\totheforth}{4}\
\si{\kilogram\totheforth}\
\si{\quartic\metre}
```

`\newprefix` The standard SI powers of ten are defined by the package, and are described above. However, the user can define new prefixes with `\newprefix`. This has syntax `\newunit [binary] {<prefix>} {<symbol>} {<powers-ten>}`, where `<powers-ten>` is the number of powers of ten the prefix represents. When the `binary` option is given, the prefix is a power of two. For example, `\kilo` and `\kibi` are defined:

```
\newprefix{\kilo}{k}{3}
\newprefix[binary]{\kibi}{Ki}{10}
```

8 Specialist units

In some subject area, there are units which are in common use even though they are outside of the SI system. Unlike the units discussed earlier, these specialist units are not loaded by default. In each case, they should be requested with the option `alsoload=<name>`.

8.1 Binary units (`binary`)

`\bit` The binary prefixes, `\bit`, `\byte` (Table 11) are not formally part of the SI system. They are available by giving the `alsoload=binary` option.

100 MiB

```
\SI{100}{\mebi\byte}
```

8.2 Synthetic chemistry (`synchem`)

`\mmHg` The `synchem` file adds the common chemistry units `\mmHg`, `\molar`, `\Molar`, `\torr` and `\dalton` to `siunitx`. The `\Molar` macro is somewhat awkward, as it can be given as either “`m`” or “`M`”. The later is obviously easily confused with the

`\dalton`

Table 12: High-energy physics units (`alsoload=hep`)

Unit	Macro	Symbol	Abbreviation
<i>Areas</i>			
yoctobarn	\yoctobarn	yb	\yb
zeptobarn	\zeptobarn	zb	\zb
attobarn	\attobarn	ab	\ab
femtobarn	\femtobarn	fb	\fb
picobarn	\picobarn	pb	\pb
nanobarn	\nanobarn	nb	\nb
<i>Other units</i>			
micron	\micron	μm	
millirad	\mrad	mrad	
gauss	\gauss	G	

sign for the prefix mega. By default, `siunitx` uses the UK default of a small-caps symbol. The `\dalton` unit is defined here as this name is not recognised by the various international bodies: the symbol u is preferred.

1 M HCl	\SI{1}{\Molar} HCl\\
760 Torr	\SI{760}{\torr}\\
0.01 mmHg	\SI{0.01}{\mmHg}\\
3.0 mol dm ⁻³	\SI{3.0}{\molar}\\
106.42 Da	\SI{106.42}{\dalton}

8.3 High-energy physics (hep)

In contrast to `hepunits`, `siunitx` does not define a long list of compound units for high-energy physics.¹⁸ Instead, a small selection of new units are defined (Table 12). The mechanisms provided by `siunitx` should avoid the need for large numbers of abbreviations. For example, the `hepunits` `\MinveV` can be given as `\per\MeV` in `siunitx`, which requires only one more character.

The `hep` option defines two units which are slightly unusual. `\clight` gives c , which is recognised as a unit when used in the appropriate circumstances. The second unit provided is `\eVperc`, which is commonly-used and clear enough for a compound definition. Notice that the value of `eVcorrb` will need to be adjusted when using this unit.

4.657 MeV/c ²	\SI[per=slash,eVcorrb=0.4ex]{4.657}{\mega\per\MeV\squared}
--------------------------	--

8.4 Astronomy (astro)

`\parsec` For astronomers, the `\parsec` and `\lightyear` units are available, and give the obvious results.

12 pc	\SI{12}{\parsec}
1 ly	\SI{1}{\lightyear}

¹⁸Using the `emulate=hepunits` option will load a file defining those.

9 Font control

Following the lead of `SIstyle`, `siunitx` provides control over the font used to typeset output. By default, all text is typeset using the current upright serif maths font, whether the macros are given in text or maths mode. Some examples will show the effect.

10 10	$\text{\num{10}}$
20° 20°	$\text{\sffamily \ang{20}}$
30 kg	$\text{\textbf{\SI{30}{\kilo\gram}}}$
40 kg	$\text{\boldmath \SI{40}{\kilo\gram}}$
50	$\text{\[\num{50} \]}$

In contrast, by setting `obeyall`, the current font is used: this may be maths or text, depending on the context.

1°1'1" 1°1'1"	$\text{\sisetup{obeyall}}$
2°2'2" 2°2'2"	$\text{\ang{1;1;1}}$
3°3'3" 3°3'3"	$\text{\sffamily \ang{2;2;2}}$
4°4'4" 4°4'4"	$\text{\textbf{\ang{3;3;3}} \boldmath \ang{3;3;3}}$
5°5'5"	$\text{\emph{\ang{4;4;4}}} \text{\emph{\ang{4;4;4}}}$

Fine control of which elements of the local font are used is available with the `obeyfamily`, `obeybold`, `obeyitalic` and `obeymode` options.

1°1'1" 1°1'1"	$\text{\sisetup{obeyfamily}}$
2°2'2" 2°2'2"	$\text{\ang{1;1;1}}$
3°3'3" 3°3'3"	$\text{\sffamily \ang{2;2;2}}$
4°4'4" 4°4'4"	$\text{\sisetup{obeybold}}$
5°5'5"	$\text{\textbf{\ang{3;3;3}} \boldmath \ang{3;3;3}}$

10 Package options

`\sisetup` The “native” options for the package are all given using the key–value method. Most of the package options can be given both when loading the package and at any point in the document. This is achieved using the `\sisetup` macro.

The package options take a number of different forms.

- `option=<bool>` Simple true/false values. These macros all default to `option=true`, meaning that giving the option name alone will set the appropriate flag.
- `option=<choice>` Take a single item from a pre-determined list. Depending on the value, one or more internal states will be altered. Values not on the list are ignored (with a warning).
- `option=<choice, literal>` If the given value is a `<choice>`, then the internal settings for that choice are used. Any other value is used directly.
- `option=<literal>` The given value is used as a literal by the package.

- `option=(csname)` These options expect a command sequence as a value.
- `option=(length)` Requires a TeX length, for example `0.5ex`.
- `option=(list)` Takes a list of one or more items, which are not determined in advance.
- `option=(number)` Takes a number (possibly including an exponent part).

The package has a large range of options, to allow full control of the various features of the package. These control differing aspects of the package, and are given below in groups based on function. Where the key has a default value, it is given in bold.

10.1 Font family and style

The font used when typesetting material can be tightly controlled using `siunitx`. A number of options affect how the package matches the surrounding font, and the font families used to achieve this. The default is to use the current upright maths serif font with no variation.

`mode`
`textmode`
`valuemode`
`unitmode`
`obeymode`

`obeyall`
`obeyfamily`
`obeybold`
`obeyitalic`

`mathsrm`
`mathssf`
`mathstt`
`textrm`
`textsf`
`texttt`

The output of `siunitx` can occur using either text or maths mode. The package option `mode` determines which is used: valid options are `maths` and `text`.¹⁹ The shortcut `textmode` is provided for setting `mode=text` quickly. Further refinement is possible using the `valuemode` and `unitmode` options. These apply to numbers (the output of `\num` and the first mandatory argument of `\SI`) and units (all other output), respectively. By setting the `obeymode` flag, the package will use the local typesetting mode (maths or text).

The detection and matching of surrounding text can be controlled using a number of Boolean package options. `obeyall` turns on all of the detection. Thus output with `obeyall` in force will always match the local text appearance. `obeyfamily` instructs the package on detecting the surrounding font family (Roman, sans serif, fixed width), but does not detect bold or italic. `obeybold` detects the local bold setting, whilst `obeyitalic` picks up italic fonts.

Bold detection is influenced by the value of `inlinebold`, which takes values `text` and `maths`. The package can detect the local value of bold for either the surrounding text, or the surrounding inline (`$$$$`) maths. The `obeyitalic` option does *not* have the same facility (maths is italic anyway).

The font commands used by the package to achieve the above are all available for user modification. The options `mathsrm`, `mathssf` and `mathstt` hold the command sequences used in maths mode,²⁰ while `textrm`, `textsf` and `texttt` do the same for text mode. By default, these contain the obvious command names, for example `mathsrm=mathrm` and `texttt=ttfamily`. However, they can be set at will: the macro names indicate the nature of the surrounding text detected. For example, the value of `mathssf` is used in maths mode when the surrounding text is sans serif.

Each of the font options can be given separately for the contents of numbers and units. The option names include `value` or `unit` before the mode

¹⁹Here and in all other cases, either UK or US spelling may be used. Thus `mode=maths` or `mode=math` have exactly the same effect.

²⁰These can also be set using `mathrm`, `mathsf` and `mathtt`

`detectdisplay`

name. For example, the `mathsrm` option may be split into `valuemathsrm` and `unitmathsrm`.

The font detection system can treat displayed mathematical content in two ways. This is controlled by the `detectdisplay` option. When set to `true`, display mathematics is treated independently from the body of the document. Thus the local *maths* font is checked for matching. In contrast, when set to `false`, display material is treated with the current running text font.

`Some text`

$$x = 1.2 \times 10^3 \text{ kg K cd}$$

`More text`

$$y = 3 \text{ m s mol}$$

```
\sffamily
Some text
\sisetup{obeyall}
\[ x = \SI{1.2e3}{\kg\kelvin\candela} \
More text
\sisetup{detectdisplay=false}
\[ y = \SI{3}{\metre\second\mole} \]
```

10.2 Spacing and separators

`unitsep`
`valuesep`
`digitsep`
`anglesep`

The separators between items can all be set using options taking a list of pre-defined items or a literal value. The “sep” options (`unitsep`, `valuesep`, `digitsep` and `anglesep`) all recognise thin, medium, med, thick, space, `cslot`, `times`, `tightcslot`, `tighttimes`, `fullstop`, `stop`, `period` and `none`. The named spaces are the normal maths separations, with `space` representing a full (non-breakable text) space, and with the obvious meanings for `cslot` and `times`. The `tight` variants reduce the spacing available. Three possible values are provided for “.”, and `none` yields no space at all. In all cases, other values are treated literally and are typeset in maths mode. The default value is `thin` for all separations except `anglesep`, which is set to `none`.

`unitspace`
`errspace`

The `unitspace` and `errspace` options again take a list or literal value, but only the “real” spaces `thin`, `medium`, `med`, `thick`, `space` and `none` are recognised in the list. The `unitspace` option controls the output generated by an explicit space (~) inside a unit macro, while `errspace` is used to separate a bracketed error from the main number.

10.3 Number formatting

`numdigits`
`numdecimal`
 `numexp`
 `numsign`
 `numaddn`
`numgobble`

`decimalsymbol`
`digitsep`
`sepfour`

There are two groups of options for formatting numbers. The first group all begin with “num”, and take literal values used by the package to parse numbers. `numdigits` contains the valid number symbols (**0123456789**), with `numdecimal` containing the decimal markers (.,). As in the `numprint` package, `numexp` (the list of exponent markers) recognises `deDE` as valid by default. `numsign` contains the sign markers for numbers (+-`\pm\mp`). `numaddn` and `numgobble` both control which other characters do not give an error when present in a number. `numaddn` contains valid characters which should be included in the final output “as is”, whereas `numgobble` lists the characters that are completely ignored. In all cases, the content of the options is a simple string, for example `numdigits=1234567890`.

The second group of number options control the output of numbers after parsing. The symbol used by `siunitx` as a decimal marker is set by the `decimalsymbol` option, which can take a list of choices or a literal. The valid

choices here are **fullstop**, comma, cdot and tightcdot.²¹ Notice that this does not have to agree with the input marker. The other separator for numerical output is the division of digits into groups of three. The result is dependant on two options. The previously-described **digitsep** option controls the spacing added between groups of three numbers. For numbers consisting of exactly four digits, the **sepfour** Boolean option controls whether separation occurs in these cases. The default is **false**.

1234 1 234	\num{1234} \\ \num[sepfour]{1234}
---------------	-----------------------------------

seperr
numopenerr
numcloseerr

For numbers given with an error [e.g. $1.23(4)$], the package can separate out the error part, to give for example 1.23 ± 0.04 . This behaviour is activated by the **seperr** option, and requires that **numopenerr** and **numcloseerr** contain the left- and right-hand delimiters for the error [defaults **numopenerr**=**(** and **numcloseerr**=**)**].

1.234 ± 0.005 $(1.234 \pm 0.005) \times 10^6$	\sisetup{seperr} \\ \num{1.234(5)} \\ \num{1.234(5)e6}
--	--

trapambigerr If the number has an exponent, or if units are not repeated, then the result can be considered ambiguous. By default, the package adds the markers stored in **openerr** and **closeerr** to remove the ambiguity; the options have the same default values as the input error markers. Detection of a potentially-ambiguous error is controlled by the **trapambigerr** option, although for numbers with units the **repeatunits** option is also important. The spacing around the \pm sign is normally set by TeX. However, using the **tightpm** option will cause this to be reduced to a minimum.

$1.234 \times 10^6 \pm 0.005 \times 10^6$ $1.234 \text{ m} \pm 0.005 \text{ m}$ $(1.234 \pm 0.005) \text{ m}$ $1.234 \pm 0.005 \text{ m}$ 1.234 ± 0.005	\sisetup{seperr} \\ \num[trapambigerr=false]{1.234(5)e6} \\ \SI{1.234(5)}{\metre} \\ \sisetup{repeatunits=false} \\ \SI{1.234(5)}{\metre} \\ \SI[trapambigerr=false]{1.234(5)}{\metre} \\ \num[tightpm]{1.234(5)}
---	---

numprod
repeatunits

The number processor can recognise products in the numerical input; the symbols used for products are stored in **numprod**, with the default value of “**x**”. By default, the **\SI** macro will repeat the units for a number given in this way. This behaviour is altered by the **repeatunits** option, which takes the values **true**, **false** and **power**. The later applies only when providing multiplied numbers with units, and converts the unit to the appropriate power rather than repeating the units.²² Notice that when applied to errors, **repeatunits** takes priority over **trapambigerr**.

²¹**fullstop** also has aliases **stop** and **period**.

²²This is a very simply option: do not expect it to work with anything except areas and volumes.

```

1 × 2 × 3
4 m × 5 m × 6 m
1.2 × 3.4 × 5.6 mm3
(1.234 ± 0.005) m
9.109 389 7 ± 0.000 005 4 × 10-31 kg
9.109 389 7 × 10-31 kg ± 0.000 005 4 × 10-31 kg
1 × 2 × 3 m3

\num{1 x 2 x 3} \\
\SI{4 x 5 x 6}{\metre} \\
\sisetup{repeatunits=false}
\SI{1.2 x 3.4 x 5.6}{\milli\metre\cubed} \\
\SI[seperr]{1.234(5)}{\metre} \\
\SI[seperr,
    trapambigerr=false]
    {9.1093897(54)e-31}{\kilo\gram} \\
\SI[seperr, repeatunits,
    trapambigerr=false]
    {9.1093897(54)e-31}{\kilo\gram} \\
\SI[repeatunits=power]{1 x 2 x 3}{\metre}

```

`expproduct`
`expbase`
`allowzeroexp`

`addsign`
`sign`
`retainplus`
`padnumber`

0.1
2
3.0
4.0
0.5
6
7
.8

`fixdp`
`dp`

The formatting of exponents is controlled by `expproduct` and `expbase`. `expproduct` sets the symbol used to indicate a product for exponents (e.g. the `x` in 2×10^2), while the value of `expbase` sets the power used (the 10 in the example). Both options accept a very short list of options: `times`, `tighttimes`, `cdot` and `tightcdot` for the product, and `ten` and `two` for the power.²³ Other choices are used literally. Also relevant to exponent processing is the `allowzeroexp` option. By default, the package will suppress a zero exponent, but setting the flag will allow the output of 10^0 .

Additions to the input can take the form of implicit signs and padded zeros. The `addsign` option takes a list of potential sites to add a sign: `none`, `mantissa`, `exponent` and `both`.²⁴ If no sign is given in the input, the setting here determines if one is added. The sign to add is stored in `sign`, which takes the list of choices `plus`, `minus`, `pm` and `mp`, or uses the input literally (in maths mode). For positive numbers, the `retainplus` option causes a + sign explicitly in the input to be retained. By default, the package will remove such signs.

The `padnumber` option controls the addition of zeros to the input, to “pad” the result. The option takes a list of choices: `leading`, `trailing`, `both` and `none`.²⁵ No additional precision is added by this option; integer input will not add a decimal point.

```

\num[padnumber=leading]{.1} \\
\num[padnumber=leading]{2.} \\
\num[padnumber=trailing]{3.} \\
\num[padnumber=both]{4.} \\
\num[padnumber=both]{.5} \\
\num[padnumber=both]{6} \\
\num[padnumber=none]{7.} \\
\num[padnumber=none]{.8}

```

In contrast to the `padnumber` option, the package can alter the precision of the input number if the `fixdp` option is set. The will fix the decimal places of the output to the number stored in the `dp` option. The later should be a positive integer.

²³The `tighttimes` and `tightcdot` options give the rather questionable results: 1×10^2 and $1 \cdot 10^2$, as opposed to 1×10^2 and $1 \cdot 10^2$.

²⁴Aliases are provided: `mant` = `mantissa`, `exp` = `exponent`, `all` = `true` = `both`, `false` = `none`.

²⁵Aliases: `all` = `true` = `both`, `false` = `none`.

-1.295	\num{-1.2942} \\
10.000	\num{-1.2949} \\
	\num{9.9999}

10.4 Angle formatting

`padangle` The angle formatter uses `\num` to format numbers: any options for numbers are therefore applicable here. The `padangle` option takes choices `small`, `large`, `all` and `none`, and controls how angles are padded when given in degrees, minutes and seconds.²⁶ When giving angles as arcs (in degrees, minutes and seconds), the package can detect if the correct number of semi-colons have been given. This is controlled by the `strictarc` option, which is a Boolean switch with a `true` default. With `strictarc` set to `false`, an incomplete arc is interpreted as degrees and minute, while an over-complete one will drop excess input.

1°	\ang[padangle=none]{1;;} \\
2°0'0"	\ang[padangle=large]{2;;} \\
3°	\ang[padangle=small]{3;;} \\
0°4'0"	\ang[padangle=both]{;4;} \\
5'5"	\ang[padangle=none]{;5;5} \\
1°2'	\ang[strictarc=false]{1;2} \\
1°2'3"	\ang[strictarc=false]{1;2;3;4;}

`angformat` The angle formatting system can convert between decimal angles and those given as degrees, minutes and seconds. This is controlled by the `angformat` option, which takes choices `unchanged`, `decimal` and `arc`.²⁷ When set to `unchanged`, nothing is done to the input. The conversion is based on TeX dimensions, and is therefore limited in accuracy. For this reason, the output is automatically rounded: output as a decimal angle is limited to three places, and that as an arc is given to a single decimal place for the seconds component.

$1^{\circ}2'3'' = 1.034^{\circ}$	\$\ang{1;2;3} = \ang[angformat=dec]{1;2;3}\$ \\
$4.56^{\circ} = 4^{\circ}33'36.0''$	\$\ang{4.56} = \ang[angformat=arc]{4.56}\$

`astroang` For astronomers, the `astroang` option is provided. This moves the degrees, minutes or seconds symbol (as appropriate) over the decimal marker rather than after the number.

$1^{\circ}2'3.4''$	\ang{1;2;3.4} \\
$5^{\circ}6'7''8$	\ang[astroang]{5;6;7.8}

10.5 Tabular material

`tabnumalign` Material typeset in S columns is processed internally by the `\num` macro. Thus,

²⁶Aliases: `all` = `true` = `both`, `false` = `none`.

²⁷Aliases: `decimal` = `dec`, `arc` = `dms`, `unchanged` = `none`.

Table 13: The `tabalignexp` option

Header	Header
1.2×10^3	1.2×10^3
1.234×10^{56}	1.234×10^{56}

as with angles, the number options also apply here. The positioning of tabular material is controlled by the two options `tabnumalign` and `tabformat`. `tabnumalign` takes values `centredecimal`, `centre`, `left` and `right`.²⁸ When using `centredecimal`, the package places the decimal marker of the mantissa at the centre of the column, which then grows to accommodate the widest number given. For equal numbers of digits before and after the decimal sign, this is the easiest option. The other choices use a fixed-width box to store the number; the box is then aligned with the edges of the column.

`tabformat`

The `tabformat` option sets the amount of space reserved by `siunitx` for the alignment box when not using the `centredecimal` setting of `tabnumalign`. The numerical parts of `tabformat` are interpreted as $\langle pre \rangle \langle dec \rangle \langle post \rangle$; $\langle pre \rangle$ and $\langle post \rangle$ are the number of digits before and after the decimal sign, respectively. Both signs and exponents can be included in `tabformat`, resulting in appropriate space being reserved. The entire `tabformat` input is processed using the `\num` macro internally. Thus the decimal and exponent signs used in `tabformat` are checked against `numdecimal` and `numexp`, respectively.

`tabalignexp`

When `tabformat` contains exponents, two possibilities are available for alignment. The first method is to place the exponent parts so that the “ $\times 10^$ ” parts form a column, with whitespace after shorter mantissa components. In the second method, no additional space is added after the mantissa, and the exponents do not line up (Table 13). This is controlled by the `tabexpalign` option, which can be set to `true` or `false`.

```
\begin{table}
\centering
\caption{The \opt{tabalignexp} option}
\label{tab:alignexp}
\sisetup{tabformat=1.3e2,tabnumalign=centre}
\begin{tabular}{SS[tabalignexp=false]}
\toprule
& \{Header\} & \{Header\} \\
\midrule
1.2e3 & & 1.2e3 \\
1.234e56 & & 1.234e56 \\
\bottomrule
\end{tabular}
\end{table}
```

`tabtextalign`
`tabunitalign`
`tabalign`

Cells containing no numbers are handled by `siunitx` in a manner similar to `\multicolumn`. The setting of `tabtextalign` is taken from the list `centre`, `right` and `left`.²⁹ As would be expected, these settings `centre`, `right`- or `left`-

²⁸Aliases `centerdecimal` = `centredecimal`; `center` = `centre`.

²⁹Alias `centre` = `center`.

Table 14: The `tabautofit` option

Header	Header	Header
1.2	1.200	1.2
1.2345	1.235	1.2345

align the cell contents. In `s` columns, all content is treated as input to the `\si` macro. The alignment of the contents relative to the cell is controlled by the `tabunitalign` option, which takes options `left`, `right` and `centre`. The settings for `tabnumalign`, `tabtextalign` and `tabunitalign` can be set to the same value in one go with the `tabalign` option.

The contents of table cells can automatically be rounded or zero-filled to the number of decimal places given in `tabformat`. This is activated by the `tabautofit` Boolean option. As `tabformat` does not apply to columns with alignment `centredecimal`, `tabautofit` is also inactive for these columns (Table 14).

```
\begin{table}
\centering
\caption{The \opt{tabautofit} option}
\label{tab:autofit}

\end{tabular}
\end{table}
```

10.6 Units

- `per` Most of the unit options are concerned with the processing of named units. The processor for units given as macro names can be influenced to give a variety of output formats. The `per` option defines how the keyword macro `\per` is handled. This option takes a choice from the list `reciprocal`, `slash` and `fraction`.³⁰ The default option uses `\per` to indicate reciprocal powers, whereas `slash` causes the package to use “/” to show division.
- `fraction` The `fraction` option defines how `per=fraction` is interpreted. The list of applicable values here is `frac`, `nice`, `ugly` and `sfrac`. In each case, the unit

³⁰Aliases `reciprocal = rp = power`, `fraction = frac`.

is typeset as a fraction, but the macro use to achieve this varies. `frac` uses the TeX `\frac`, macro, while `nice` makes use of a `\nicefrac`-like method. The `ugly` option uses a slash in text mode and `\frac` in maths mode.³¹ Finally, the setting `fraction=sfrac` uses the `\sfrac` macro from the `xfrac` package, when available.³² The `slash` option sets the symbol used when `per=slash` is in force. This recognises the single keyword `slash`; anything else is used literally.

`m`
 $\frac{m}{s}$
 $\frac{m}{\%}$
 m/s

```
\sisetup{per=fraction}
\si[fraction=frac]{\metre\per\second} \\
\si[fraction=nice]{\metre\per\second} \\
\si[fraction=sfrac]{\metre\per\second} \\
\si[per=slash]{\metre\per\second}
```

`stickyper` By default, `\per` applies only to the next unit given.³³ By setting the `stickyper` flag, this behaviour is changed so that `\per` applies to all subsequent units.³⁴

$kg\ m^{-1}\ A$
 $kg\ m^{-1}\ A^{-1}$

```
\si{\kilogram\per\metre\ampere} \\
\si[stickyper]{\kilogram\per\metre\ampere}
```

`trapambigfrac`
`openfrac`
`closefrac`

When using `per=slash`, multiple units in the denominator will yield a potentially ambiguous result. The `trapambigfrac` determines whether the package checks for this: this takes `true` and `false`. When set, the contents of `openfrac` are inserted before the denominator, and `closefrac` is inserted after.

$m/(s\ kg)$
 $m/s\ kg$

```
\sisetup{trapambigfrac,openfrac=(),closefrac=},per=slash} \\
\si{\metre\per\second\per\kilogram} \\
\si[trapambigfrac=false]{\metre\per\second\per\kilogram}
```

`prefixsymbolic`
`prefixbase`
`prefixproduct`

The unit prefixes (`\kilo`, etc.) are normally given as letters. However, the package can convert these into numerical powers.³⁵ This is controlled by the `prefixsymbolic` Boolean option, which by default is `true`. If `prefixsymbolic` is set to `false`, the format of the prefix is controlled by `prefixbase` and `prefixproduct`, which work in the same way as `expbase` and `expproduct`.

`prespace`
`xspace`
`allowoptarg`

By default, the single unit macros (e.g. `\metre`) add no space either before or after the unit. Setting the `xspace` flag to true means that the single macros are followed by the `\xspace` command (when used outside of `\SI`/`\si`). For users of `unitsdef`, the `prespace` macro changes the behaviour of the unit macros, so that they can immediately follow a number. As a result, the unit macros will always be preceded by a fixed space when the `prespace` flag is true: this will be in addition to any other space. Also relevant to users moving from `unitsdef` is the `allowoptarg` option. This allows single unit macros to take an optional numerical argument, in the same way that occurs in that package.

³¹Similar to the `ugly` option of the `nicefrac` package.

³²`xfrac` is part of the experimental system for L^AT_EX3. As it requires a number of additional packages to work, `siunitx` does not load `xfrac`. If it is unavailable, the `sfrac` setting will fall back to using `\nicefrac`. See the `xfrac` documentation for reasons to prefer `\sfrac` to `\nicefrac`.

³³This is the standard method of reading units in English: for example, $J\ mol^{-1}\ K^{-1}$ is pronounced "joules per mole per kelvin".

³⁴This is the behaviour in Slunits.

³⁵Provided things are not too complex!

mis the symbol for metres

\sisetup{allowoptarg}
\metre[40]
```

10.7 Symbols

User access to control the symbols used for Ω , μ , $^\circ$, $'$, $"$, \AA and $^\circ\text{C}$ is provided here. These are all literal options, which are available in text and maths mode variants. For example, `textmicro` is the code used for the μ symbol in text mode. The text mode macros should be safe when forced into text, and the maths ones when forced into maths. The symbols defined in this way are:

- `textOmega;`
- `mathsOmega;`
- `textmu;`
- `mathsmu;`
- `textdegree;`
- `mathsdegree;`
- `textminute;`
- `mathsminute;`
- `textsecond;`
- `mathssecond;`
- `textringA;`
- `mathsringA;`
- `textcelsius;`
- `mathscelsius.`

`redefsymbols` When `siunitx` is loaded, it can check for the presence of the `textcomp` and `upgreek` packages, to provide better symbols for certain items. To prevent this, set the `redefsymbols` option `false` (the default is `true`).

`eVcorra` The `eV` symbol requires some fine-tuning, and so has two options of its own, both \TeX lengths. `eVcorra` is the correction applied to the gap between “e” and “V” of the unit: the default is `0.3ex`. `eVcorrb` is the correction applied to the gap between “V” of the unit and whatever follows; the default is `0ex`. The optimal value for these options will depend on the current font settings.³⁶

`eV/m` $\text{\si}[per=slash] { \text{electronvolt} \text{per} \text{metre} } \\$ `eV/m` $\text{\si}[per=slash,eVcorrb=0.7ex] { \text{electronvolt} \text{per} \text{metre} }$

³⁶This document uses `eVcorra=0.1ex`.

10.8 Colour

colourall
colourunits
colourvalues

The package provides internal hooks for applying colour to part or all of the output. This requires the user to load the `color` or `xcolor` package to support colour in the output; `siunitx` will ignore a colour request if support is unavailable. The Boolean options `colourall`, `colourunits` and `colourvalues` are used to turn application of a given colour on or off for all output, only units and only values, respectively. All three switches are available with US spelling, e.g. `colorall` and `colourall` behave in the same way. With colour turned off, no `\color` command is issued internally, and output follows the surrounding text.

colour
unitcolour
valuecolour

The colour names to use for colouring output are set by the `colour`, `unitcolour` and `valuecolour` options (all also available with US spelling). The `colour` option internally sets both `unitcolour` and `valuecolour`.

Text 50
10 m
Text 70
40 s

```
{\color{brown} Text \num{50}}\\
\sisetup{colourall, colour=green}
\SI{10}{\metre}\\
{\color{purple} Text \num{70}}\\
\sisetup{colourunits=true, colourvalues=false}
\SI{40}{\second}
```

colourneg
negcolour

`siunitx` can automatically add a colour to negative numbers. This is turned on using the `colourneg` switch. The colour used is set by the `negcolour` option; both options are available using US spellings.

10.9 International support

locale

`siunitx` allows the user to switch between the typographic conventions of different (geographical) areas by using *locales*. Currently, the package is supplied with configurations for locales UK, USA, DE (Germany) and ZA (South Africa). The `locale` option is used to switch to a particular locale.

1.234 m
6,789 m

```
\SI{1.234}{\metre}\\
\SI[locale=DE]{6.789}{\metre}
```

loctolang

Locales are distinct from `babel` languages, as typographic conventions are not tightly integrated with language. However, it is useful to be able to associate a particular locale with a `babel` language. The option `loctolang` handles this, and expects pairs of values: `loctolang=<locale>:<language>`.

$6.022 \times 10^{23} \text{ mol}^{-1}$
 $6,022 \cdot 10^{23} \text{ mol}^{-1}$

```
\sisetup{loctolang={UK:UKenglish,DE:german}}\\
\SI{6.022e23}{\per\mole}\\
\selectlanguage{german}\\
\SI{6.022e23}{\per\mole}
```

10.10 Package control

load
noload
alsoload

The package keeps most of the unit and abbreviations definitions in files separate from `siunitx.sty`. To control what is loaded, three complementary options are provided, all of which take a list of one or more choices. `load` and `alsoload` define which support configuration files are loaded. The list in `load` recognises the value `default`, which is expanded to the normal list before loading. The

difference between `load` and `alsoload` is that `load` specifies the *complete* list of files to load, whereas `alsoload` adds to the existing list. To use the `load` option successfully requires knowing everything that is needed. The `noload` option can be used to delete one or more items from the `load` list, without needing to know what is on it.³⁷

`log`
`debug`
`strict`

To control data written to the `.log` file, the `log` option is provided. This takes a value from the list `normal`, `none`, `minimal`, `errors` and `debug`. As would be expected, these indicate the amount of detail written to the log file. As a shortcut to `log=debug`, the package also recognises the `debug` option directly.

Some users will want to stick closely to the official rules for typesetting units. This could be made complicated if the options for non-standards behaviour could not be turned off. The load-time option `strict` resets package behaviour to follow the rules closely, and disables options which deviate from this. If the package is loaded with the `strict` option, all output is made in maths mode using the upright serif font.

10.11 Back-compatibility options

`emulate`

The package can emulate `Slunits`, `Slstyle`, `unitsdef`, `units`, `hepunits`, `fancyunits` and `fancynum`. Giving the `emulate=<package>` option will give the desired emulation, and combinations which would be possible with the real packages will also work here. The package will recognise the options of the emulated packages. This will automatically cause emulation to be switched on.

10.12 Summary of all options

Table 15 lists a summary of the package options (excluding those for backward-compatibility). A reminder of the input format is also provided.

Table 15: All package options

Option	Type	Description
<code>addsign</code>	List	Add sign to number
<code>allowzeroexp</code>	Boolean	Allow 10^0
<code>angformat</code>	List	Conversion of angle format
<code>anglesep</code>	List or literal	Space between angle components
<code>astroang</code>	Boolean	Astronomy-style angles
<code>closeerr</code>	Literal	Closes potential-ambiguous error
<code>closefrac</code>	Literal	Closes potential-ambiguous fraction
<code>color</code>	Literal	Colour used for units and values
<code>colour</code>	Literal	Colour used for units and values
<code>colorall</code>	Boolean	Switch for colouring all output
<code>colourall</code>	Boolean	Switch for colouring all output
<code>colorneg</code>	Boolean	Colour negative numbers
<code>colourneg</code>	Boolean	Colour negative numbers
<code>colorunits</code>	Boolean	Switch for colouring units

Continued on next page

³⁷`noload` does not prevent the loading of a file needed by one which is loaded. Thus the package may internally override a `noload` value if needed.

Option	Type	Description
colourunits	Boolean	Switch for colouring units
colorvalues	Boolean	Switch for colouring values
colourvalues	Boolean	Switch for colouring values
decimalsymbol	List or literal	Decimal symbol
debug	Boolean	Write debugging data to log
detectdisplay	Boolean	Treat display maths separately
digitsep	List	Separation of digits in large numbers
dp	Integer	Number of decimal places to output numbers to
emulate	Modules	Emulation modules to load
errspace	List	Spacing of bracketed error
eVcorra	Length	Spacing correction in eV
eVcorrb	Length	Spacing correction after eV
expbase	List or Literal	Base used for exponents
expproduct	List or literal	Product sign for exponents
fixdp	Boolean	Switch for fixing decimal places of numbers
fraction	List	Method used when setting <code>per=frac</code>
inlinebold	List	Select how inline bold is tested
load	Modules	Modules to load
locale	Modules	Locale to follow
loctolang	Special	Associate locale with babel language
log	List	Amount of data added to log
mathOmega	Literal	" Ω " symbol in maths mode
mathcelsius	Literal	" $^{\circ}\text{C}$ " symbol in maths mode
mathdegree	Literal	" $^{\circ}$ " symbol in maths mode
mathminute	Literal	" $^{\prime\prime}$ " symbol in maths mode
mathmu	Literal	" μ " symbol in maths mode
mathringA	Literal	" A° " symbol in maths mode
mathrm	Csname	Roman maths font
mathsOmega	Literal	" Ω " symbol in maths mode
mathscelsius	Literal	" $^{\circ}\text{C}$ " symbol in maths mode
mathsdegree	Literal	" $^{\circ}$ " symbol in maths mode
mathsecond	Literal	" $^{\prime\prime\prime}$ " symbol in maths mode
mathsf	Csname	Sans serif maths font
mathsminute	Literal	" $^{\prime\prime\prime}$ " symbol in maths mode
mathsmu	Literal	" μ " symbol in maths mode
mathsringA	Literal	" A° " symbol in maths mode
mathsrm	Csname	Roman maths font
mathssecond	Literal	" $^{\prime\prime\prime\prime}$ " symbol in maths mode
mathssf	Csname	Sans serif maths font
mathstt	Csname	Fixed-width maths font
mathtt	Csname	Fixed-width maths font
mode	List	Use text or maths mode for typesetting
negcolor	Literal	Colour used for negative numbers
negcolour	Literal	Colour used for negative numbers

Continued on next page

Option	Type	Description
noload	Modules	Modules not to load
numaddn	Literal	Additional input allowed in numbers
numcloseerr	Literal	Character indicating end of numerical error
numdecimal	Literal	Decimal symbols in numbers
numdigits	Literal	Digit characters in numbers
numexp	Literal	Exponent characters in numbers
numgobble	Literal	Characters to ignore in numbers
numopenerr	Literal	Character indicating start of numerical error
numprod	Literal	Characters used for a product
numsign	Literal	Sign characters in numbers
obeyall	Boolean	Combination of <code>obeybold</code> , <code>obeyitalic</code> and <code>obeymode</code>
obeybold	Boolean	Check local bold setting
obeyitalic	Boolean	Check local italic setting
obeymode	Boolean	Check local mode (text/math)
openerr	Literal	Opens potentially-ambiguous error
openfrac	Literal	Opens potentially-ambiguous fraction
padangle	List	Add zeros to blank parts of angles
padnumber	List	Add zeros to blank parts of numbers
per	List	Behaviour of <code>\per</code>
prefixbase	List or literal	Base used when making prefixes numerical
prefixproduct	List or literal	Product sign for prefixes
prefixsymbolic	Boolean	Behaviour of unit prefixes
prespace	Boolean	Add space before units
redefsymbols	Boolean	Use better symbols if available
repeatunits	List	Repeat units with separated errors and products
retainplus	Boolean	Retain explicit plus sign
seperr	Boolean	Separate number and error
sepfour	Boolean	Separate four-digit numbers
sign	List or literal	Sign to add to numbers
slash	List or literal	Symbol used for “/”
stickyper	Boolean	Require <code>\per</code> only once
strict	Boolean	Obey the rules strictly
strictarc	Boolean	Require exactly zero or two semi-colons
tabalign	List	Positioning of all column data
tabalignexp	Boolean	Alignment of exponents in tables
tabautofit	Boolean	Switch for rounding numbers to length given by <code>tabformat</code>
tabformat	Number	Space reserved in table for numbers
tabnumalign	List	Alignment of S column numbers
tabtextalign	List	Positioning of text in S columns
tabunitalign	List	Positioning of units in s columns

Continued on next page

Option	Type	Description
textcelsius	Literal	"°C" symbol in text mode
textdegree	Literal	"°" symbol in text mode
textminute	Literal	"" symbol in text mode
textmu	Literal	"μ" symbol in text mode
textomega	Literal	"Ω" symbol in text mode
textringa	Literal	"Å" symbol in maths mode
textrm	Csname	Roman text font
textsecond	Literal	"" symbol in text mode
textsf	Csname	Sans serif text font
texttt	Csname	Fixed-width text font
tightpm	Boolean	Reduce space around ±
trapambigerr	Boolean	Check for ambiguous errors
trapambigfrac	Boolean	Check for ambiguous fractions
unitcolor	Literal	Switch for colouring units
unitcolour	Literal	Switch for colouring units
unitmathrm	Csname	Roman maths font for units
unitmathsf	Csname	Sans serif maths font for units
unitmathrm	Csname	Roman maths font for units
unitmathsf	Csname	Sans serif maths font for units
unitmathstt	Csname	Fixed-width maths font for units
unitmathtt	Csname	Fixed-width maths font for units
unitmode	List	As mode, for units only
unitsep	List or literal	Separator for units
unitspace	List or literal	Space used for " ~ " in units
valuecolor	Literal	Switch for colouring value
valuecolour	Literal	Switch for colouring value
valuemathrm	Csname	Roman maths font for values
valuemathsf	Csname	Sans serif maths font for values
valuemathrm	Csname	Roman maths font for values
valuemathsf	Csname	Sans serif maths font for values
valuemathstt	Csname	Fixed-width maths font for values
valuemathtt	Csname	Fixed-width maths font for values
valuemode	List	As mode, for values only
valuesep	List or literal	Separator between value and unit
xspace	Boolean	Use xspace after units

11 Emulation of other packages

siunitx has been designed as a replacement for Slunits, Slstyle, unitsdef, units, hepunits, fancyunits and fancynum. It therefore provides options to reproduce the functions of all of these packages. In this way, siunitx should be usable as a straight replacement for the older packages.³⁸ This means for example that the \num macro takes an optional star when emulating Slstyle. However, there are some points that should be remembered. In particular, siunitx validates numerical

³⁸User macros means that they are described in the package documentation; simply not containing an @ does not mean they will have been emulated.

input, meaning that places where a number is expected in the older packages *require* a number when emulated by `siunitx`.

The `numprint` package has provided many useful ideas for the code used here for number formatting. The basic use of the `\numprint` (or `\np`) macro can be reproduced using `siunitx`. However, `numprint` is large and complex, with its own backward-compatibility options. As a result, emulation of `numprint` is not provided here. To use an `numprint` document with `siunitx`, the `\numprint` macro could be provided using the following code.

```
-123 456          \newcommand* {\numprint} [2] [] {\SI [obeymode] {#2} {#1}} \\ 
-123 456 N/mm2 \numprint {-123456} \\
\numprint [N/mm2] {-123456}
```

`siunitx` can be used more-or-less directly to replace both `dcolumn` and `rccol`. As is explained in the code section, much of the column-alignment system here is taken from `dcolumn`, while `rccol` provided a model for a customisable system. However, neither package has been directly emulated here. The `S` column type can be used to replace both `D` and `R` columns by setting the appropriate package options.

12 Configuration files

`siunitx` is a modular package. The unit definitions, abbreviations and locales are all stored in configuration files. These all take names of the form `si-<name>.cfg`, where `<name>` is the part of the filename used as an option in `\sisetup` or when loading `siunitx`. Producing new configuration files therefore consists of making a suitably-named file and adding it to the path searched by `TeX`. The files should normally consist of settings (in `\sisetup`) and unit definitions, *etc*.

`\addtolocale`

To allow arbitrary macros to be stored in locales, the `\addtolocale` macro is provided. This ensures that arbitrary text is only executed when using a locale, not when loading it.

`\requiresiconfigs`

To load one or more configuration files from inside another configuration file, the `\requiresiconfigs` macro is provided. This accepts a comma-separated list of configuration names, in the same way as `load` or `noload`.

In addition to the various configuration files provided with the package, a local file `siunitx.cfg` may be provided. This is read at the end of loading `siunitx`, and allows the user to include any local definitions or settings easily.

13 Common questions

13.1 Why do I need `\per` more than once?

The unit engine of `siunitx` is based around the English method for reading units out loud. Thus $J\ mol^{-1}\ K^{-1}$ is pronounced “joules per mole per kelvin”. Hence by default you need to put `\per` before each item in the denominator of a unit. The behaviour can be altered by setting the `stickyper` option.

13.2 Why is the order of my units changed?

Then using `per=reciprocal`, the units are typeset as given. However, when using `per=slash` or `per=fraction`, the package needs to find which ones are in the denominator. It then prints the numerator and denominator separately. So if you give a unit in the denominator *before* one in the numerator, they have to be re-ordered.³⁹

$88 \text{ kg}^{-1} \text{ m}$
 66 m/kg

```
\SI{88}{\per\kilogram\metre} \\  
\SI[per=slash]{66}{\per\kilogram\metre}
```

13.3 Why are compound units not recommended outside of `\SI/\si`?

To fully process units made up of several parts, the processor has to know where the end of the unit is. When the unit macros are used outside of `\SI/\si`, this is not the case. The package therefore does its best, but results may be sub-optimal. To get consistent results, either define a new *single* unit, or keep compound units inside `\SI` and `\si`.

$\text{m}/\mu\text{s}$
 $\text{m } \mu\text{s}^{-1}$
 $\text{m } \mu\text{s}^{-1}$
 $\text{kg m } \mu\text{s}^{-1}$
 $\text{kgm } \mu\text{s}^{-1}$

```
\metre\per\micro\second \\  
\si{\metre\per\micro\second} \\  
\newunit{\myunit}{\metre\per\micro\second}  
\myunit  
\newunit{\myunittwo}{\kilogram\myunit} \\  
\myunittwo \\  
\kilogram\myunit
```

Notice the difference in behaviour of `\per` in the first two lines, and the spacing error on the last line in the example.

13.4 How do I set superscripts to use lining numbers?

Lowercase (“old style”) numbers are favoured by many people for use in running text. However, this does not necessarily look good in superscripts. The mode used to typeset data can be varied, so that maths mode numbers are used for the unit part of the output.

1234 m s^{-1}
 1234 m s^{-1}

```
\SI [mode=text]{1234}{\metre\per\second} \\  
\SI [valuemode=text,unitmode=maths]{1234}{\metre\per\second}
```

13.5 Why do most of the examples use $\text{J mol}^{-1} \text{ K}^{-1}$?

The package author is a chemist, and this is the unit of entropy (disorder). It nicely demonstrates the use of the `\per` macro, and so it crops up a lot. It is also in the subsection heading here to act as a test with `hyperref` and moving arguments!

³⁹“Double division” (1 s/m/kg) is mathematically incorrect.

13.6 What can `numprint` do that `siunitx` cannot?

`siunitx` uses a lot of ideas from `numprint`: a reasonable amount of the number-processing code here is based on that in `numprint`. However, the two packages have somewhat different aims, and as a result there are things that `numprint` can do that `siunitx` does not implement. The main features of `numprint` not available here are:

- General support for numbers with base other than 10 (see `nbaseprt`);
- Alignment of the decimal marker of powers in tables;
- Alignment of numbers in running text;
- Specific formatting commands for \TeX counters and lengths.

14 Tricks and known issues

14.1 Ensuring maths mode

Due to the possibility of output in either maths or text mode, any input which requires a particular mode needs to be protected. You cannot use `$...$`, as this can get “caught out”, but also as it may give hard-to-follow errors. Always use `\ensuremath` to force maths processing, and `\text` (from the \AMSTEX bundle) to ensure text mode.

14.2 Using . in units

To use a literal `.` in a unit, it has to be protected from expansion. Using `\text` will not work here (in contrast to `\textstyle`). A robust command is needed:

```
\newunit{\myunit}{V~vs.\~NHE}%
\SI{10}{\myunit}%
\DeclareRobustCommand*\MyUnit{V~vs.\~NHE}
\renewunit[unitspace=space]{\myunit}{\MyUnit}
\SI{20}{\myunit}
```

14.3 Limitations of `\mathrm`

The package uses the `\mathrm` font family by default to typeset output in maths mode. This however has a few side-effects. For example, the Greek alphabet can give odd results.⁴⁰ The use of the `\mathnormal` font *may* get around this issue.

```
48 \times 10^{-7}%
4\pi \times 10^{-7}%
\num[numaddn=\pi]{4\pi e-7}%
\num[numaddn=\pi,mathsfmath=mathnormal]{4\pi e-7}
```

On the other hand, you may want to use text mode, in which case `\ensuremath` is needed. Depending on the exact circumstances, the \TeX protection mechanism (`\DeclareRobustCommand`) may be sufficient; in some cases, this will fail and the ε - \TeX `\protected` system may be required. There are several potential pitfalls in this area; experimentation may well be needed.

⁴⁰This depends on your font setup; this document uses T1 encoding, which shows the issue, whereas using OT1 does not.

```

 $4\pi \times 10^{-7}$  \DeclareRobustCommand*{\numpi}{\ensuremath{\pi}}
 $\text{num}[numaddr=\numpi, mode=text]{4\numpi e-7}$ 

```

14.4 Entire document in sans serif font

If your entire document is not in a Roman font, using the font detection system is not the most efficient method for setting the `siunitx` output. Instead, the `mathrm` and `textrm` package options can be redefined.

Some text 1×10^2 3 N $4 \times 10^5 \text{ Pa}$	<pre> \sfamily Some text \\ \ssetup{obeyfamily=false,mathrm=mathsf,textrm=sffamily} \num{1e2} \\ \SI{3}{\newton} [\num{4e5} \si{\pascal}] </pre>
---	--

14.5 Effects of emulation

The package has been designed so that almost everything can be set using the options. In the emulation code, some internal macros are redefined. This is because the legacy packages do odd things, which are deliberately not implemented by `siunitx`. Using an emulation file will prevent subsequent loading of the real package. This is to prevent errors or, worse, difficult to diagnose changes to output.

14.6 Centring columns on non-decimal input

The `dcolumn` manual suggests using that package to align a column on a \pm sign. The same type of output is possible using `siunitx`, but some care is needed ([Table 16](#)). Odd things may happen: use with care!

```

\begin{table}
\caption{Non-standard \texttt{S} column}
\label{tab:dcolumn}
\centering
\begin{tabular}{%
 S[digitsep=none,decimalsymbol={\text{,}\text{,pm}\text{,}},%
 numdigits={0123456789.},numdecimal=+]}
\toprule
{Some Values} \\
\midrule
2.3456 + 0.02 \\
34.2345 + 0.001 \\
56.7835 + 0.067 \\
90.473 + 0.021 \\
\bottomrule
\end{tabular}
\end{table}

```

Table 16: Non-standard S column

Some Values
2.3456 ± 0.02
34.2345 ± 0.001
56.7835 ± 0.067
90.473 ± 0.021

14.7 Adding items after the last column of a tabular

If you use an S or s column as the last one in a tabular, and you use the array “<” construction to add items after it, the spacing may be wrong. This will occur if the column contents are of differing widths. Changing the L^AT_EX \\ line ending for the plain T_EX \cr will give the correct spacing, but does not allow adjustment of inter-row distance (Table 17).⁴¹ In most cases, this should not be a serious issue.

```
\begin{table}
  \caption{Correcting spacing in last \texttt{S} column}
  \label{tab:cr}
  \hfil
  \begin{tabular}{S<\, \si{\kg} S<\, \si{\kg}}
    \toprule
    \multicolumn{1}{c}{Long header} &
    \multicolumn{1}{c}{Long header} \\
    \midrule
    1.23 & 1.23 \\
    4.56 & 4.56 \\
    7.8 & 7.8 \\
    \bottomrule
  \end{tabular}
  \hfil
  \begin{tabular}{S<\, \si{\kg} S<\, \si{\kg}}
    \toprule
    \multicolumn{1}{c}{Long header} &
    \multicolumn{1}{c}{Long header} \\
    \midrule
    1.23 & 1.23 \cr
    4.56 & 4.56 \cr
    7.8 & 7.8 \cr
    \bottomrule
  \end{tabular}
  \hfil
\end{table}
```

⁴¹For the T_EX experts, the issue here is that the system to gather up cell contents is added in using the < construction. Normally, this comes after the cell contents and any other < arguments, so collects the user additions. However, in the last cell the contents include \\, which is converted to \cr before gathering can occur. By using \cr directly, the gathering process receives all of the cell contents as normal.

Table 17: Correcting spacing in last S column

Long header	Long header	Long header	Long header
1.23 kg	1.23 kg	1.23 kg	1.23 kg
4.56 kg	4.56 kg	4.56 kg	4.56 kg
7.8 kg	7.8 kg	7.8 kg	7.8 kg

15 Reporting a problem

`siunitx` is quite long and complicated, and works hard to cover all possible eventualities. However, there will be bugs in the code and unexpected interactions with other packages. If you think you have found a bug, please report it. A short test-case demonstrating the problem would be very welcome. The following is a suitable template, and is available as `si-bug.ltx` in the `doc/latex/siunitx` directory or by running the `.dtx` or `.ins` file through `TeX`.

```

1 \listfiles
2 \documentclass{article}
Load other packages needed here.
3 \usepackage{siunitx}
Normally, debugging the load procedure will not be needed; the debug option
here means that all run-time information is logged.
4 \sisetup{debug}
5 \begin{document}
6 This is the bug test-case document for the \textsf{siunitx}
7 package.\\
8 Please put your demonstration here, and e-mail to the package
9 author.
10 \begin{center}
11   \texttt{joseph.wright@morningtar2.co.uk}
12 \end{center}
13 \end{document}

```

16 Feature requests

Feature requests for `siunitx` are welcome. The package maintainer will consider any ideas within the remit of the package (units and values). If suggesting a new feature, an example of how it should work would be appreciated. If new controls are needed, some suggestions for option names would be welcome.

17 Acknowledgements

Many thanks indeed to Stefan Pinnow, who has made a very large number of suggestions and found numerous bugs in the package. His contribution to the package has been vital. The package author has learned `LATEX` tricks from far too many people to thank all of them. However, for this package specific thanks must go to the authors of the existing “unit” packages: Danie Els (`S1style`), Marcel Heldoorn (`Slunits`), Patrick Happel (`unitsdef`), Axel Reichert (`units`) and Harald

Harders (numprint). Will Robertson and Heiko Oberdiek deserve much credit for demonstrating \LaTeX coding best practice. Victor Eijkhout's excellent (and free) *T_EX by Topic* has provided some useful coding hints [2]. The idea for combining and extending unit provision in \LaTeX was heavily inspired by Philip Lehmann's biblatex. Thanks to the various contributors of ideas for the package: Donald Arseneau, Michele Dondi, Paul Gans, Ben Morrow, Lan Thuy Pham, Alan Ristow, Patrick Heinze, Andrea Blomenhofer, Morten Høgholm, Burkhard Moddemann and Patrick Steegstra.

Part III

Correct application of (SI) units

18 Background

Consistent and logical units are a necessity for scientific work, and have applicability everywhere. Historically, a number of systems have been used for physical units. SI units were introduced by the *Conférence Générale des Poids et Mesures* (CGPM) in 1960. SI units are a coherent system based on seven base units, from which all other units may be derived.

At the same time, physical quantities with units are mathematical entities, and as such way that they are typeset is important. In mathematics, changes of type (such as using bold, italic, sans serif typeface and so on) convey information. This means that rules exist not only for the type of units to be used under the SI system, but also the way they should appear in print. Advice on best practice has been made available by the *National Institute of Standards and Technology* (NIST) [3].

As befits an agreed international standard, the full rules are detailed. It is not appropriate to reproduce these in totality here; instead, a useful summary of the key points is provided. The full details are available from the *Bureau International des Poids et Mesures* (BIPM) in French [4] and English [5]. They also publish a very useful and detailed guide to using units, values and so on, available online in a number of different formats [6].

`siunitx` takes account of the information given here, so far as is possible. Thus the package defaults follow the recommendations made for typesetting units and values. Spacing and so forth is handled in such a way as to make implementing the rules (relatively) easy.

19 Units

19.1 SI base units

There are seven base SI units, listed in [Table 4](#). Apart from the kilogram, these are defined in terms of a measurable physical quantity needing the definition alone.⁴² The base units have been chosen such that all physical quantities can be expressed using an appropriate combination of these units, needing no others and with no redundancy. The kilogram is slightly different from the other base units as it is still defined in terms of a “prototype” held in Paris.⁴³

19.2 SI derived units

All other units within the SI system are regarded as “derived” from the seven base units. At the most basic, all other SI units can be expressed as combinations of the base units. However, many units (listed in [Table 6](#), [Table 7](#) and [Table 8](#))

⁴²Some base units need others defined first; there is therefore a required order of definition.

⁴³At the time of writing, this is under review and will be altered.

have a special name and symbol.⁴⁴ Most of these units are simple combinations of one or more base units (raised to powers as appropriate). A small number of units derived from experimental data are allowed as SI units ([Table 7](#)).

Some of these units (in [Table 8](#)) are regarded as only “temporarily” accepted, as the use of only the base and fully-consistent derived units in [Table 6](#) is encouraged. They are accepted as they are in common use in one or more disciplines; some are still very widespread in the appropriate areas. These units are mainly multiples of base units (for example, a tonne is 1000 kg).

One point to note is that “unitless ratios” are regarded as having base units which cancel out. For example, the radian is regarded as having base unit m m^{-1} . The result of this division (“1”) is therefore regarded as a derived SI unit in this context.

19.3 SI prefixes

A series of SI prefixes for decimal multiples and submultiples are provided, and can be used as modifiers for any SI unit (either base or derived units) with the exception of the kilogram. The prefixes are listed in [Table 5](#). No space should be used between a prefix and the unit, and only a single prefix should be used. Even the degree Celsius can be given a prefix, for example $1 \text{ m}^\circ\text{C}$. The only exception to this rule is for degrees, minutes and seconds of an arc: $1^\circ 2' 3''$.

It is important to note that the kilogram is the only SI unit with a prefix as part of its name and symbol. Only single prefix may be used, and so in the case of the kilogram prefix names are used with the unit name “gram” and the prefix symbols are used with the unit symbol g. For example $1 \times 10^{-6} \text{ kg} = 1 \text{ mg}$.

19.4 Other units

The application of SI units is meant to provide a single set of units which ensure consistency and clarity across all areas. However, other units are common in many areas, and are not without merit. The units provided by siunitx by default do not include any of these; only units which are part of the SI set or are accepted for use with SI units are defined. However, several other sets of units can be loaded as optional modules. The binary prefixes and units ([Section 8.1](#) and [Table 11](#)) are the most obvious example. These are *not* part of the SI specifications, but the prefix names are derived from those in [Table 5](#).

Other units (such as those provided by the modules `synchem`, `hep` and `astro`) are normally to be avoided where possible. SI units should, in the main, be preferred due to the advantages of clear definition and self-consistency this brings. However, there will probably always be a place for specialist or non-standard units. This is particularly true of units derived from basic physical constants; for example reason, the `hep` module defines the speed of light, c , as a unit. For work in basic science, a small number of physical constants are recognised as units provided the results for comparison with experiment are given in SI units.

There are also many areas where non-standard units are used so commonly that to do otherwise is difficult or impossible. For example, most synthetic

⁴⁴The nautical mile has a given name but no agreed symbol, and although accepted by the SI is not provided by siunitx as a unit macro.

chemists measure the pressure inside vacuum apparatus in mmHg, partly because the most common gauge for the task still uses a column of mercury metal. For these reasons, siunitx does define non-SI units.

20 Units and values in print

20.1 Mathematical meaning

As explained earlier, a unit–value combination is a single mathematical entity. This has implications for how both the number and the unit should be printed. Firstly, the two parts should not be separated. With the exception of the symbols for plane angles ($^{\circ}$, $'$ and $''$), it is usual to have a space between the unit and the value. This should therefore be a non-breaking space between the two. Different geographical areas have different conventions on the size of this space; a “small” space (,) is the siunitx default.

A space for 10%
and also for 100 °C
but not for 1.23°.

A space for \SI{10}{\percent} \\
and also for \SI{100}{\celsius} \\
but not for \ang{1.23}.

The mathematical meaning of units also means that the shape, weight and family are important. Units are supposed to be typeset in an upright, medium weight serif font. Italic, bold and sans serif are all used mathematically to convey other meanings. siunitx package defaults again follow this convention: any local settings are ignored, and uses the current upright serif maths font. However, there are occasions where this may not be the most desirable behaviour. A classic example would be in an all-bold section heading. As the surrounding text is bold, some people feel that any units should follow this.

Units should **not be bold:** 54 F
But perhaps in a running block,
it might look better: 54 F

Units should \textbf{not be bold:} \SI{54}{\farad} \\
\textbf{But perhaps in a running block,} \\
it might look better: \SI[obeybold]{54}{\farad}

20.2 Unit multiplication and division

Symbols for units formed from other units by multiplication are indicated by means of either a half-height (that is, centred) dot or a (thin) space. This document uses a half-height dot as (i) this is the recommendation of NIST, amongst others and (ii) it avoids potential confusion between unit prefixes and multiplied units.

m s = metre second
ms = millisecond
m s = metre second
ms = millisecond

```
$\si{\metre\second} = \boxed{\text{metre second}}$ \\  
$\si{\milli\second} = \boxed{\text{millisecond}}$ \\  
\sisetup{unitsep=thin}  
$\si{\metre\second} = \boxed{\text{metre second}}$ \\  
$\si{\milli\second} = \boxed{\text{millisecond}}
```

There are some circumstances under which it is permissible to omit any spaces. The classic example is kWh, where “kWh” does not add any useful information. If using such a unit repeatedly, users of siunitx are advised to create a custom unit to ensure consistency.⁴⁵

⁴⁵\kWh and \kilowatthour are defined by siunitx in this way.

Symbols for units formed from other units by division are indicated by means of a virgule (oblique stroke, slash, $/$), a horizontal line, or negative exponents.⁴⁶ However, to avoid ambiguity, the virgule must not be repeated on the same line unless parentheses are used. This is ensured when using named unit macros in siunitx, which will “trap” repeated division and format it correctly. In complicated cases, negative exponents are to be preferred over other formats.

$$\text{J mol}^{-1}\text{K}^{-1}$$

$$\frac{\text{J}}{\text{mol K}}$$

$$\text{J}/(\text{mol K})$$

```
\si{\joule\per\mole\per\kelvin} \\
\si[per=fraction]{\joule\per\mole\per\kelvin} \\
\si[per=slash]{\joule\per\mole\per\kelvin}
```

20.3 Repeating units

Products and errors should show what unit applies to each value given. Thus $2\text{ m} \times 3\text{ m}$ is an ordered set of lengths of a geometric area, whereas $2 \times 3\text{ m}$ is a length (and equal to 6 m). Thus, \times is not a product but is a mathematical operator; in the same way, a 2×3 matrix is not a 6 matrix! In some areas, areas and volumes are given with separated units but a unit raised to the appropriate power: $2 \times 3\text{ m}^2$. Although this does display the correct overall units, it is potentially-confusing and is not encouraged.

20.4 Clarity in writing values of quantities

Care must be taken when writing ranges of numbers. For purely numerical values, it is common to use an en-dash between values, for example “see pages 1–5”. On the other hand, values with units could be misinterpreted as negative values if written in this way. As the unit-value combination is a single mathematical entity, writing the values with an en-dash followed by a single unit is also incorrect. As a result, using the word “to” is strongly recommended.

1 m to 5 m long.

```
\SI{1}{\metre} to \SI{5}{\metre} long.
```

20.5 Graphs and tables

In tables and graphs, repetition of the units following each entry or axis mark is confusing and repetitive. It is therefore best to place the unit in the label part of the information. Placing the unit in square brackets is common but mathematically poor.⁴⁷ Much better is to show division of all values by the unit, which leaves the entries as unitless ratios. This is illustrated in [Table 18](#) and [Figure 1](#).

```
\begin{table}
\centering
\caption{An example of table labelling}
\label{tab:label}
\begin{tabular}{cS[tabformat=1.4,tabnumalign=centre]}
\toprule
{Entry} & {Length/\si{\metre}} \\
\end{tabular}

```

⁴⁶Notice that a virgule and a solidus are not the same symbol.

⁴⁷For example, for an acceleration a , the expression $[a]$ is the dimensions of a , i.e. length per time squared in this case.

Table 18: An example of table labelling

Entry	Length/m
1	1.1234
2	1.1425
3	1.7578
4	1.9560

```
\midrule
1 & 1.1234 \\
2 & 1.1425 \\
3 & 1.7578 \\
4 & 1.9560 \\
\bottomrule
\end{tabular}
\end{table}

\begin{figure}
\centering
\begin{tikzpicture}
\begin{axis} [ xlabel=$t/\text{second}$, ylabel=$d/\text{metre}$ ]
\addplot [smooth,mark=x]
    plot coordinates {
        (0,0)
        (1,5)
        (2,8)
        (3,9)
        (4,8)
        (5,5)
        (6,0)
    };
\end{axis}
\end{tikzpicture}
\caption{An example of graph labelling}
\label{fig:label}
\end{figure}
```

In most cases, adding exponent values in the body of a table is less desirable than adding a fixed exponent to column headers. An example is shown in [Table 19](#). The use of `\multicolumn` is needed here due to the "<"; without `\multicolumn`, the titles are followed by "kg"!

```
\begin{table}
\centering
\caption{Good and bad columns}
\label{tab:exp}
\sisetup{tabnumalign=centre}
\begin{tabular}{%
    c%
    S[tabformat=1.3e1]<\, \si{\kilogram} }%
```

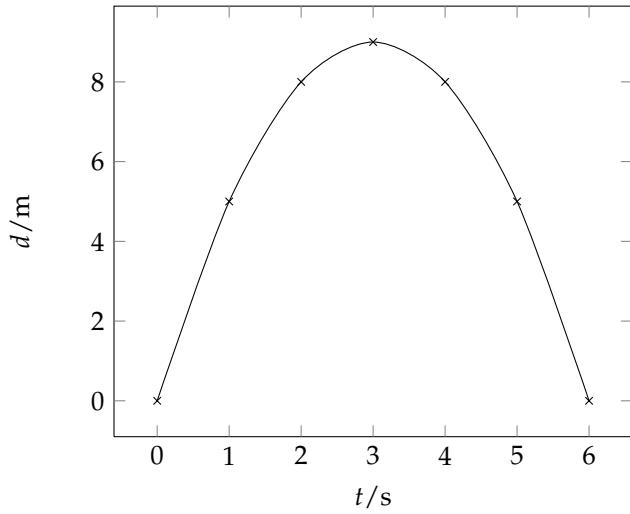

Figure 1: An example of graph labelling

Table 19: Good and bad columns

Entry	Mass	Mass/ 10^3 kg
1	4.56×10^3 kg	4.56
2	2.40×10^3 kg	2.40
3	1.345×10^4 kg	13.45
4	4.5×10^2 kg	0.45

```

S[tabformat=2.2]
\toprule
Entry & \multicolumn{1}{c}{Mass} &
{Mass/\SI{e3}{\kilo\gram}} \\
\midrule
1 & 4.56e3 & 4.56 \\
2 & 2.40e3 & 2.40 \\
3 & 1.345e4 & 13.45 \\
4 & 4.5e2 & 0.45 \\
\bottomrule
\end{tabular}
\end{table}

```

Part IV

Implementation

21 Main package

Much of the code here is taken, with little or no modification, from the existing packages. These are all released under the LPPL, and so this use is entirely allowed. Rather than confuse the source here with repeated references, note that code here could be copied from `Slstyle`, `Slunits`, `numprint`, `unitsdef` or `units`. Some ideas have also been borrowed from `biblatex`; again these will not be specifically noted. Code from other packages will be marked when used.

User-space commands (those not containing `@`) defined here should give the same result as macros with the same name in the older packages.⁴⁸ However, internal package macros will behave differently; if the user has redefined internal macros, then compatibility will be impaired.

The code used here uses \LaTeX rather than \TeX commands where possible.⁴⁹ For example, `\newcommand*` is used in place of `\def`, unless custom parameters are needed. Hopefully, this will aid future maintenance. Grouping is used where possible to limit the scope of temporary assignments.

21.1 Setup code

```
\si@svn@version
\si@svn@id
\si@svn@ver
```

As always, the package starts with identification. This defines a couple of macros for use with *Subversion*, so that everything is nice and clear. This should also make it a bit easier to avoid messing up the revision data! For anyone reading the source, the revision number is also available as well as the release version number, of course.

```
1 \NeedsTeXFormat{LaTeX2e}
2 \newcommand*\si@svn@ver{v1.0b}
3 \def\si@svn@id$#1: #2.#3 #4 #5-#6-#7 #8 #9${%
4   \newcommand*\si@svn@version{%
5     #5/#6/#7\space\si@svn@ver\space}%
6 \si@svn@id $Id: siunitx.dtx 88 2008-06-23 08:25:52Z joseph $
7 \ProvidesPackage{siunitx}
8   [\si@svn@version A comprehensive (SI) units package]
```

The package requires \epsilon-TEx , so the usual test is made.

```
9 \begingroup
10  \@ifundefined{eTeXversion}
11    {\PackageError{siunitx}{%
12      {Not running under e-TEx}%
13      {This package requires e-TEx. Try compiling the document%
14       with\MessageBreak `elatex' instead of `latex'. When%
15       using pdfTeX, try `pdfelatex'\MessageBreak instead of%
16       `pdflatex'}%%
17    \endgroup\endinput}
18  \endgroup
```

⁴⁸Although extra optional arguments may be added.

⁴⁹This applies to \LaTeX kernel commands only; for example, `\ifthenelse` is not used.

\si@catcodes There are circumstances under which some odd category codes might be in place. The category codes for {, }, [,] and # are assumed to be okay; if issues arise, this can be altered. L^AT_EX will have set @ as a letter on loading siunitx.

```

19 \edef\si@catcodes{%
20   \catcode`string`\string ` \the\catcode\string`\\`relax
21   \catcode`string`\string = \the\catcode\string`\\`relax
22   \catcode`string`\string ^ \the\catcode\string`\\`relax
23   \catcode`string`\string ~ \the\catcode\string`\\`relax
24   \catcode`string`\string : \the\catcode\string`\\`relax
25   \catcode`string`\string - \the\catcode\string`\\`relax
26   \catcode`string`\string + \the\catcode\string`\\`relax
27   \catcode`string`\string ; \the\catcode\string`\\`relax
28   \catcode`string`\string , \the\catcode\string`\\`relax
29   \catcode`string`\string . \the\catcode\string`\\`relax}
30 \catcode`string`\\` 12`relax
31 \catcode`\\`= 12`relax
32 \catcode`\\`^ 7`relax
33 \catcode`\\`~ \active`relax
34 \@makeother{\`}
35 \@makeother{\`}
36 \@makeother{\`}
37 \@makeother{\`}
38 \@makeother{\`}
39 \@makeother{\`.}

```

Packages needed for functionality are loaded. xkeyval handles the package options, while amstext from the *AMS* bundle is needed for \text. array is needed for the new column type for tabular material. xspace provides “magic” spacing after macros, if requested.

```

40 \RequirePackage{xkeyval} [2005/05/07]
41 \RequirePackage{amstext, array, xspace}

```

\si@tempa Some scratch commands are defined; apart from where a known value is carried through, these could contain anything.

```

\si@tempb 42 \newcommand*{\si@tempa}{}
\si@tempb 43 \newcommand*{\si@tempb}{}
\si@tempb 44 \newcommand*{\si@tempc}{}

```

\ifsi@switch Various items will need a switch. To avoid name pollution, a single switch is defined here; grouping will keep the definition local.

```
45 \newif\ifsi@switch
```

\si@tempboxa Some boxes are also needed.

```

\si@tempboxb 46 \newbox\si@tempboxa
\si@tempboxb 47 \newbox\si@tempboxb
\si@tempboxd 48 \newbox\si@tempboxc
\si@tempboxd 49 \newbox\si@tempboxd

```

\si@packagecheck \si@blockpkgs \si@checkpkgs As siunitx is intended to replace the other unit-management packages, these are tested for before any further processing. If any are loaded, the package halts compilation; name clashes or unexpected results could occur if this is not tested. Notice that Slunits and Slstyle could be loaded with variable capitalisation (at least on Windows); both possibilities are tested.

```

50 \newcommand*{\si@blockpkgs}{SIunits,sistyle,siunits,SIstyle,%
51   unitsdef,fancyunits}
52 \newcommand*{\si@checkpkgs}{units,hepunits,fancynum}
53 \newcommand*{\si@packagecheck}{%
54   \begingroup
55   \@for\si@tempa:=\si@blockpkgs\do{%
56     \@ifpackageloaded{\si@tempa}%
57     {\PackageError{siunitx}%
58      {Package '\si@tempa' incompatible}%
59      {The \si@tempa\space package and siunitx are%
60       incompatible.\MessageBreak Use the%
61       'emulate=\si@tempa' package option when loading%
62       siunitx}%
63    }%
64  }%

```

Some packages should not cause a clash, but are emulated and would be better handled that way.

```

64  \@for\si@tempa:=\si@checkpkgs\do{%
65    \@ifpackageloaded{\si@tempa}%
66    {\PackageWarning{siunitx}%
67      {Consider loading the siunitx package%
68       with\MessageBreak option 'emulate=\si@tempa', rather%
69       than\MessageBreak loading both \si@tempa\space and%
70       siunitx}%
71    }%
72  \endgroup

```

The check is carried out on loading and at the beginning of the document, so that packages loaded both before and after `siunitx` are caught.

```

73 \si@packagecheck
74 \AtBeginDocument{\si@packagecheck}

```

`\si@ifdefinable` Using `\@ifdefinable` to check macro definitions gives a generic error. To give something more helpful, `\@ifundefined` is used, but this needs some `\expandafter` work. This way it can also be used as a form of `\@ifundefined` for macro names.

```

\si@ifdefinable{\langle macro\rangle}
75 \newcommand*{\si@ifdefinable}[1]{%
76   \expandafter\expandafter\expandafter\@ifundefined{%
77     \expandafter\expandafter\expandafter\expandafter\%%
78     \expandafter\@gobble\string#1}%

```

`\si@addtolist` It is quite useful to be able to add to a comma-separated list of expandable items.

```

\si@addtolist{\langle macro\rangle}{\langle items\rangle}
79 \newcommand*{\si@addtolist}[2]{%
80   \lfix\@empty#1\@empty
81   \edef#1{\#2}%
82   \else
83   \edef#1{\#1,\#2}%
84   \fi}

```

`\si@addtocsname` A second item to add to a command sequence.

```

\si@temptoks \si@addtocsname{\langle csname\rangle}{\langle tokens\rangle}
85 \newtoks{\si@temptoks}

```

```

86 \newcommand*{\si@addtocsname}[2]{%
87   \@ifundefined{#1}%
88   {\expandafter\gdef\csname #1\endcsname{#2}}%
89   {\si@temptoks\expandafter\expandafter\expandafter{%
90     \csname #1\endcsname#2}%
91   \expandafter\xdef\csname #1\endcsname{\the\si@temptoks}}}

\si@ifmtarg To keep down dependance on other packages, the very short code block from
\si@xifmtarg ifmtarg is copied here with an internal name.

\si@ifnotmtarg 92 \begingroup
93   \catcode`\Q=3
94   \long\gdef\si@ifmtarg#1{%
95     \si@xifmtarg#1QQ\@secondoftwo\@firstoftwo\@nil}
96   \long\gdef\si@xifmtarg#1#2Q#3#4#5\@nil{#4}
97   \long\gdef\si@ifnotmtarg#1{%
98     \si@xifmtarg#1QQ\@firstofone\@gobble\@nil}
99 \endgroup

\si@newrobustcmd Some more copying, this time from etoolbox. Various macros need to be really
\si@newcommand robust. This is achieved using the  $\epsilon$ -TEX \protected primitive in various places.
\si@newcmd However, it would be nice to have a \protected version of \newcommand.
\si@xargdef etoolbox has code for that, but to avoid needing to load it, the necessary stuff
is copied here. The only changes form the original are names, and the use of
\newcommand* for the \si@newcommand macro.
\si@newcommand{\macro}
\si@newcmd{\macro}[\numargs]
\si@xargdef{\macro}[\numargs][\default]{\def}
100 \@ifpackageloaded{etoolbox}
101 { \let\si@newrobustcmd\newrobustcmd
102 { \protected\def\si@newrobustcmd{%
103   \@ifstar
104     {\let\l@ngrel@x\protected\si@newcommand}
105     {\def\l@ngrel@x{\protected\long}\si@newcommand}}
106   \newcommand*{\si@newcommand}[1]{\@testopt{\si@newcmd#1}0}
107   \def\si@newcmd#1[#2]{%
108     \@ifnextchar[%
109       {\si@xargdef#1[#2]}
110       {\@argdef#1[#2]}}
111   \long\def\si@xargdef#1[#2][#3]{%
112     \ifdefinable#1{%
113       \expandafter\protected
114       \expandafter\def
115       \expandafter#1%
116       \expandafter{%
117         \expandafter\@testopt
118         \csname\string#1\endcsname{#3}}%
119       \expandafter\@yargdef
120       \csname\string#1\endcsname\tw@{#2}{#4}}}}

```

21.2 Logging

```
\ifsi@debug To control logging, some new switches are declared.
\ifsi@logmin
\ifsi@lognone
```

```

121 \newif\ifsi@debug
122 \newif\ifsi@logmin
123 \newif\ifsi@lognone

\si@log@err Some handy re-usable macros are defined here. These all take names beginning
\si@log@warn These pop up in various places. First errors, warnings and information are
\si@log@inf handled. Package options are used to control how much output is given.
    \si@log@err{\} {\}
    \si@log@warn{\}
    \si@log@inf{\}

124 \newcommand*{\si@log@err}[2]{%
125   \ifsi@lognone\else
126     \ifsi@logmin
127       \PackageWarning{siunitx}{#1}%
128     \else
129       \PackageError{siunitx}{#1}{#2}%
130     \fi
131   \fi}
132 \newcommand*{\si@log@warn}[1]{%
133   \ifsi@lognone\else
134     \ifsi@logmin\else
135       \PackageWarning{siunitx}{#1}%
136     \fi
137   \fi}
138 \newcommand*{\si@log@inf}[1]{%
139   \ifsi@lognone\else
140     \ifsi@logmin\else
141       \PackageInfo{siunitx}{#1}%
142     \fi
143   \fi}

\si@log@debug The debug macro only gives output if the appropriate package option is set.
    \si@log@debug{\}

144 \newcommand*{\si@log@debug}[1]{%
145   \ifsi@lognone\else
146     \ifsi@debug
147       \PackageInfo{siunitx}{#1}%
148     \fi
149   \fi}

```

21.3 String comparison

```

\si@str@ifchrstr At various points, the package needs to compare two strings, to find if one occurs
\si@str@chrstr in the other. The first test is if a single character is part of a second string; this is
used, for example, to check that a character is valid as input. The first argument
is not expanded further, but the second is two allow division into individual
units.
    \si@str@ifchrstr{\<char>} {\<chars>}
    \si@str@chrstr{\<char>}{\<chars>}@\emptyty

150 \newcommand*{\si@str@ifchrstr}[2]{%
151   \begingroup
152     \si@switchfalse

```

```

153     \renewcommand* {\si@tempa}{#1}%
154     \protected@edef\si@tempb{#2}%
155     \expandafter\si@str@chrstr\si@tempb\@empty\@empty\@empty
156     \ifsi@switch
157         \aftergroup\@firstoftwo
158     \else
159         \aftergroup\@secondoftwo
160     \fi
161 \endgroup}
162 \def\si@str@chrstr#1#2\@empty{%
163     \renewcommand* {\si@tempc}{#1}%
164     \ifx\si@tempa\si@tempc
165         \expandafter\si@switchtrue
166     \else
167         \ifx\@empty#2\@empty\else
168             \si@str@chrstr#2\@empty\@empty
169         \fi
170     \fi}

```

\si@str@ifonlychrs The second test builds on the first. Here, a check is made to see if the first string is made up only of characters from the second string. In this case, the first string is expanded before testing. The second string will be expanded by the internal character by character test.

```

\si@str@ifonlychars{\langle string\rangle }{\langle valid-chars\rangle }
\si@str@onlychars<char>\langle chars\rangle\@empty
171 \newcommand*{\si@str@ifonlychrs}[2]{%
172     \begingroup
173     \si@switchtrue
174     \protected@edef\si@tempa{#1}%
175     \renewcommand* {\si@tempb}{#2}%
176     \expandafter\si@str@onlychrs\si@tempa\@empty\@empty\@empty
177     \ifsi@switch
178         \aftergroup\@firstoftwo
179     \else
180         \aftergroup\@secondoftwo
181     \fi
182 \endgroup}
183 \def\si@str@onlychrs#1#2\@empty{%
184     \si@str@ifchrstr{#1}{\si@tempb}
185     {}{\si@switchfalse}%
186     \ifx\@empty#2\@empty\else
187         \si@str@onlychrs#2\@empty\@empty
188     \fi}

```

21.4 Option handling

\sisetup To allow modification of options at run time, a setup macro is provided.

```

189 \newcommand*{\sisetup}{\setkeys[si]{key}}

```

\si@opt@key To aid maintenance, some shortcuts are defined for generating keys. These also allow the debugging messages to be added automatically to every key. First of all the basic key definition.

```

\si@opt@key{\langle keyname\rangle }{\langle code\rangle }

```

```

190 \newcommand*{\si@opt@key}[2]{%
191   \define@key[si]{key}{#1}
192   {##2\si@log@debug{Option #1 set to ##1}}}

\si@opt@cmdkey The command versions of the above.
\si@opt@cmdkeys \si@opt@cmdkey[\langle default\rangle]{\langle keyname\rangle}{\langle function\rangle}
\si@opt@cmdkeys[\langle default\rangle]{\langle keynames\rangle}

193 \newcommand*{\si@opt@cmdkey}[3][]{%
194   \define@cmdkey[si]{key}[si@]{#2}[#1]{#3}}
195 \newcommand*{\si@opt@cmdkeys}[2][]{%
196   \define@cmdkeys[si]{key}[si@]{#2}[#1]}

\si@opt@boolkey Keys which only take switch values; anything other than true or false will
generate a warning from xkeyval.
\si@opt@boolkey[\langle optional-processing\rangle]{\langle keyname\rangle}

197 \newcommand*{\si@opt@boolkey}[2][]{%
198   \define@boolkey[si]{key}[si@]{#2}[true]
199   {#1\si@log@debug{Option #2 set to ##1}}}

\si@opt@choicekey A “fill in the blanks” choice key. In all cases, \si@tempa is used to hold the
value given to the key, so that \ifx testing can occur.
\si@opt@choicekey[\langle default\rangle]{\langle keyname\rangle}{\langle choices\rangle}{\langle in-list\rangle}

200 \newcommand*{\si@opt@choicekey}[4][]{%
201   \define@choicekey*[si]{key}{#2}[\si@tempa]{#3}[#1]
202   {#4\si@log@debug{Option #2 set to ##1}}
203   {\si@log@warn{Unknown value ‘##1’ for option #2}}}

\si@opt@xchoicekey Several of the package options can take either a choice from a list of known
options, or a value to be interpreted literally. To aid maintenance, the necessary
code can be set up here. These keys all define a new macro, which must exist.
The \si@opt@xchoicekey macro therefore ensures that this is defined, as well
as setting up the xkeyval key.
\si@opt@xchoicekey{\langle keyname\rangle}{\langle choices\rangle}{\langle initial\rangle}

204 \newcommand*{\si@opt@xchoicekey}[3]{%
205   \define@choicekey*[si]{key}{#1}[\si@tempa]{#2}[#1]

This code will execute if the option is on the list. There will be a “fixed” macro
with a matching name, which is used for this.

206   {\si@log@debug{Option #1 set to ##1}%
207    \expandafter\renewcommand\expandafter*\expandafter{%
208      \csname si@#1\endcsname\{@nameuse{si@fix##1}}}

The user has given something that is not on the list as an argument. It is used
literally.

209   {\si@log@debug{Option #1 set to ##1}%
210    \expandafter\renewcommand\expandafter*\expandafter{%
211      \csname si@#1\endcsname{##1}}}

Finally, the initial value of the macro is set up.

212   \expandafter\newcommand\expandafter*\expandafter{%
213     \csname si@#1\endcsname}%
214     {\@nameuse{si@fix#3}}}

```

\si@opt@compatkey An all-in-one definition for a back-compatibility key. These should only be used at load time, so are automatically disabled once the package is loaded. Emulation is also automatically turned on.

```
215 \newcommand*\si@opt@compatkey[2]{%
216   \define@boolkey[si]{key}{si@old@}{#2}[true]
217   {\si@log@debug{Emulating #1 package option\MessageBreak #2}%
218    \sisetup{emulate=#1}%
219    \si@log@debug{Option #2 set to ##1}%
220    \AtEndOfPackage{\si@opt@disablekey{#2}%
221      {Compatibility option #2 only\MessageBreak
222       available when loading siunitx package}}}
```

\si@opt@disablekey The ability to disable a key with a meaningful message is a must; the warning will come from `siunitx`, and not from `xkeyval`

```
223 \newcommand*\si@opt@disablekey[2]{%
224   \key@ifundefined[si]{key}{#1}%
225   {}
226   {\si@log@debug{Disabling key #1}%
227    \si@opt@key{#1}{\si@log@warn{#2}}}}
```

The `xkeyval` package option for logging is declared. This is then processed to set the switches correctly.

```
228 \si@opt@choicekey[normal]{log}{debug,verbose,normal,errors,none}
```

A series of comparisons are made to assign the logging mode. The `normal` option is not tested, as executing the option sets the switches appropriately.

```
229 { \si@debugfalse
230   \si@logminfalse
231   \si@lognonefalse
232   \renewcommand*\si@tempb{none}%
233   \ifx\si@tempa\si@tempb
234     \si@lognonetrue
235   \fi
236   \renewcommand*\si@tempb{minimal}%
237   \ifx\si@tempa\si@tempb
238     \si@logmintrue
239   \fi
240   \renewcommand*\si@tempb{debug}%
241   \ifx\si@tempa\si@tempb
242     \si@debugtrue
243   \fi
244   \renewcommand*\si@tempb{verbose}%
245   \ifx\si@tempa\si@tempb
246     \si@debugtrue
247   \fi}
```

A quick method to set `log=debug`.

```
248 \si@opt@boolkey{debug}
```

\ifsi@strict It would be useful to be able to disable some keys, when strict interpretation of the rules is desired. This is a load-time option, and has to disable various options.

```

249 \si@opt@boolkey[%  

250   \ifsi@strict  

251     \sisetup{  

252       obeymode=false,  

253       obeybold=false,  

254       obeyitalic=false,

274 \AtEndOfPackage{  

275   \si@opt@disablekey{emulate}  

276   {Option 'emulate' only available when\MessageBreak  

277     loading package}}}

```

\si@unitsep The two `...sep` options control the size of spaces between the number and the unit (`\si@valuesep`), and that used to represent a product (`\si@unitsep`). Known values here are `thin`, `med`, `medium`, `thick`, `cdot`, `tightcdot`⁵⁰ and `none`;⁵¹ other entries will be treated as custom spaces.

```

278 \si@opt@xchoicekey{unitsep}  

279   {thin,med,medium,thick,none,comma,stop,fullstop,period,  

280    times,tighttimes,cdot,tightcdot}{thin}  

281 \si@opt@xchoicekey{unitspace}{space,thin,med,medium,thick,  

282  none}{thin}  

283 \si@opt@xchoicekey{errspace}{space,thin,med,medium,thick,  

284  none}{none}  

285 \si@opt@xchoicekey{valuesep}  

286   {thin,med,medium,thick,none,comma,stop,fullstop,period,  

287    times,tighttimes,cdot,tightcdot}{thin}

```

\si@digitsep Separation of digits in large numbers is controlled by the `digitsep` option. As with the other `sep` values, this one has a choice of possible values. The list is

⁵⁰Both `\cdot`-based options only valid for `unitsep`.

⁵¹Only valid for `valuesep`.

quite long, so that a range of options are handled automatically. Notice that digitsep=none will be used for no separation at all.

```
288 \si@opt@xchoicekey{digitsep}
289   {thin,med,medium,thick,none,comma,stop,fullstop,period,
290     times,tighttimes,cdot,tightcdot}{thin}
```

\si@decimalsymbol The symbol used for the decimal position is varied here. There are only two real options, but options are given for the name of a full stop.

```
291 \si@opt@xchoicekey{decimalsymbol}{comma,stop,fullstop,period,
292   cdot,tightcdot}{fullstop}
```

\si@anglesep The separator between degrees and minutes, and between minutes and seconds, when using \ang.

```
293 \si@opt@xchoicekey{anglesep}
294   {thin,med,medium,thick,none,comma,stop,fullstop,period,
295     times,tighttimes,cdot,tightcdot}{none}
```

\ifsi@obeymode The first test for the font control is whether to respect the surrounding maths or text mode.

```
296 \si@opt@boolkey{obeymode}
```

\ifsi@numtextmode The output of the package can be typeset using either text or maths mode fonts.

\ifsi@unittextmode Two switches are needed, for numbers and units.

```
297 \newif\ifsi@numtextmode
298 \newif\ifsi@unittextmode
```

The textmode option has to set both flags.

```
299 \si@opt@choicekey[true]{textmode}{true,false}
300   {\si@numtextmodefalse
301     \si@unittextmodefalse
302     \renewcommand*\{\si@tempb}{true}%
303     \ifx\si@tempa\si@tempb
304       \si@numtextmodetrue
305     \si@unittextmodetrue
306   \fi}
```

The mode option applies to numbers and units.

```
307 \si@opt@choicekey{mode}{math,maths,text}
308   {\si@numtextmodefalse
309     \si@unittextmodefalse
310     \renewcommand*\{\si@tempb}{text}%
311     \ifx\si@tempa\si@tempb
312       \si@numtextmodetrue
313     \si@unittextmodetrue
314   \fi}
```

Now the two options for numbers or units alone.

```
315 \si@opt@choicekey{valuemode}{math,maths,text}
316   {\si@numtextmodefalse
317     \renewcommand*\{\si@tempb}{text}%
318     \ifx\si@tempa\si@tempb
319       \si@numtextmodetrue
320     \fi}
```

```

321 \si@opt@choicekey{unitmode}{math,maths,text}
322   {\si@unittextmodefalse
323     \renewcommand*{\si@tempb}{text}%
324     \ifx\si@tempa\si@tempb
325       \si@unittextmodetrue
326     \fi}

```

\ifsi@obeyfamily The package can work to match the font family (serif, sans serif, typewriter) of the surrounding text. This is controlled by a Boolean option.

```

327 \si@opt@boolkey{obeyfamily}

```

\ifsi@obeybold The package can attempt to respect bold, or may ignore it.

```

328 \si@opt@boolkey{obeybold}

```

\ifsi@inlinebtext For inline maths, two options for checking what is bold are available, the maths environment (*i.e.* \boldmath) and the surrounding text (\textbf or \bffamily).

```

329 \newif\ifsi@inlinebtext
330 \si@opt@choicekey{inlinebold}{text,maths,math}
331   {\si@inlinebtextfalse
332     \renewcommand*{\si@tempb}{text}%
333     \ifx\si@tempa\si@tempb
334       \si@inlinebtexttrue
335     \fi}

```

\ifsi@obeyitalic Italic is slightly different to bold, as there is no convenient switch for maths. Thus a choice key is used, with the appropriate check.

```

336 \si@opt@boolkey{obeyitalic}

```

\ifsi@detectdisplay For handling display mathematics, a setting is needed for whether to treat it differently from other maths.

```

337 \si@opt@boolkey{detectdisplay}

      The option to obey all font switching commands is Boolean-like but needs alternative setup.

```

```

338 \si@opt@choicekey[true]{obeyall}{true,false}
339   {\si@obeyboldfalse
340     \si@obeyitalicfalse
341     \si@obeymodefalse
342     \si@obeyfamilyfalse
343     \renewcommand*{\si@tempb}{true}%
344     \ifx\si@tempa\si@tempb
345       \si@obeyboldtrue
346       \si@obeyitalictrue
347       \si@obeymodetrue
348       \si@obeyfamilytrue
349     \fi}

```

\si@valuemathsrn The fonts used by the package default to the obvious L^AT_EX ones; however, this \si@valuemathssf needs to be exposed to user modification. First the maths mode fonts are sorted \si@valuemathstt out.

```

\si@unitmathsrn 350 \si@opt@cmdkeys{valuemathsrn,valuemathssf,valuemathstt}
\si@unitmathssf 351 \si@opt@cmdkeys{unitmathsrn,unitmathssf,unitmathstt}
\si@unitmathstt

```

To make life easier for the user, US spellings are provided for the maths keys.

```
352 \si@opt@key{valuemathrm}{\sisetup{valuemathsrm=#1}}
353 \si@opt@key{valuemathsf}{\sisetup{valuemathssf=#1}}
354 \si@opt@key{valuemathtt}{\sisetup{valuemathstt=#1}}
355 \si@opt@key{unitmathrm}{\sisetup{unitmathsrn=#1}}
356 \si@opt@key{unitmathsf}{\sisetup{unitmathssf=#1}}
357 \si@opt@key{unitmathtt}{\sisetup{unitmathstt=#1}}
```

The combined options are given, for setting numbers and units at the same time.

```
358 \si@opt@key{mathsrn}{\sisetup{valuemathsrm=#1,unitmathsrn=#1}}
359 \si@opt@key{mathssf}{\sisetup{valuemathssf=#1,unitmathssf=#1}}
360 \si@opt@key{mathstt}{\sisetup{valuemathstt=#1,unitmathstt=#1}}
361 \si@opt@key{mathrm}{\sisetup{valuemathsrm=#1,unitmathsrn=#1}}
362 \si@opt@key{mathsf}{\sisetup{valuemathssf=#1,unitmathssf=#1}}
363 \si@opt@key{mathtt}{\sisetup{valuemathstt=#1,unitmathstt=#1}}
```

`\si@valuetextrm` The same thing for text mode fonts. Once again the default values are pretty obvious.

```
\si@valuetexttt 364 \si@opt@cmdkeys{valuetextrm,valuetextsf,valuetexttt}
\si@unittextrm 365 \si@opt@cmdkeys{unittextrm,unittextsf,unittexttt}
\si@unittextsf 366 \si@opt@key{textrm}{\sisetup{unittextrm=#1,valuetextrm=#1}}
\si@unittexttt 367 \si@opt@key{textsf}{\sisetup{unittextsf=#1,valuetextsf=#1}}
368 \si@opt@key{texttt}{\sisetup{unittexttt=#1,valuetexttt=#1}}
```

`\si@numdigits` The list of possible valid characters for parsing numbers is set up. This is similar to `numprint`, but with the `extra` class, and with characters ignored with no output renamed as `gobble`.

```
\si@numprod 369 \si@opt@cmdkeys{numdigits,numdecimal,numexp,numgobble,numsign,%
\si@numgobble 370 numcloseerr,numopenerr,numaddn,numprod}
```

`\si@numsign`
`\si@numvalid` The various valid characters are collected together in a single macro for later. In common with the above macros, this one starts `\si@num....`. The order here is the order the values are tested later on.

```
371 \newcommand*{\si@numextra}%
372   {\si@numopenerr\si@numcloseerr\si@numaddn}
373 \newcommand*{\si@numvalid}{\si@numgobble\si@numexp\si@numsign
374   \si@numdecimal\si@numdigits\si@numextra\si@numprod}
```

`\ifsi@seperr` An option to control whether numerical error values are printed with or separate from the number.

```
\ifsi@trapambigerr 375 \si@opt@boolkey{seperr}
\si@closeerr 376 \si@opt@boolkey{trapambigerr}
377 \si@opt@cmdkeys{openerr,closeerr}
```

`\ifsi@sepfour` With four digits in a number, separating may or may not be desired. Note that this option is the same as one for `numprint`.

```
378 \si@opt@boolkey{sepfour}
```

`\ifsi@retainplus` An option to keep an explicit positive sign.

```
379 \si@opt@boolkey{retainplus}
```

```

\si@expbase The options for exponents are set up.

\si@expproduct 380 \si@opt@xchoicekey{expproduct}{times,tighttimes,
381   cdot,tightcdot}{times}
382 \si@opt@xchoicekey{expbase}{ten}{ten}

\ifsi@allowzeroexp The package normally prevents  $10^0$ .
383 \si@opt@boolkey{allowzeroexp}

\si@prefixproduct The marker for multiplication in prefixes.

384 \si@opt@xchoicekey{prefixproduct}{times,tighttimes,cdot,
385   tightcdot,none}{times}

\si@prefixbase In the same area, the power for prefixes is variable. Here, two choices ar needed.
386 \si@opt@xchoicekey{prefixbase}{ten,two}{ten}

\ifsi@prefixsymbolic Unit prefixes can be given as either symbols or numerically.
387 \si@opt@boolkey{prefixsymbolic}

\ifsi@num@padlead A setting is needed to indicate when to add zeros to decimal numbers, either
\ifsi@num@padtrail before the decimal marker (.1 giving "0.1") or after (1. giving "1.0").

388 \newif\ifsi@num@padlead
389 \newif\ifsi@num@padtrail

```

\ifsi@tabalignexp A switch for aligning exponents.

```

547 \si@opt@boolkey{tabalignexp}

\si@tab@mантprecnt To process the format information, various internal number-processing macros
\si@tab@mантpostcnt are used. First, some storage areas are created.
\si@tab@expprecnt 548 \newcount\si@tab@mантprecnt
\si@tab@exppostcnt 549 \newcount\si@tab@mантpostcnt
\ifsi@tab@mантsign 550 \newcount\si@tab@expprecnt
\ifsi@tab@expsign 551 \newcount\si@tab@exppostcnt

```

```

552 \newif\ifsi@tab@mantsign
553 \newif\ifsi@tab@expsign

```

The input is split into a mantissa and exponent, then passed to a re-useable macro for further processing.

```

554 \si@opt@cmdkey{tabformat}
555   {\si@num@fixpm
556     \renewcommand*\{\si@num@arg}{tabformat data}%
557     \renewcommand*\{\si@num@exp}{ }%
558     \renewcommand*\{\si@num@mant}{ }%
559     \si@tab@mantsignfalse
560     \si@tab@expsignfalse
561     \si@switchfalse
562     \si@num@sepmantexp{#1}%

```

When checking for a sign, the internal flag for finding but deleting a plus sign is used.

```

563   \si@num@sepsign{mant}%
564   \ifx\@empty\si@num@mantsign\@empty
565     \ifsi@num@delplus
566       \expandafter\expandafter\expandafter\si@tab@mantsigntrue
567     \fi
568   \else
569     \expandafter\si@tab@mantsigntrue
570   \fi
571   \si@num@sepsign{exp}%
572   \ifx\@empty\si@num@expsign\@empty
573     \ifsi@num@delplus
574       \expandafter\expandafter\expandafter\si@tab@expsigntrue
575     \fi
576   \else
577     \expandafter\si@tab@expsigntrue
578   \fi
579   \si@opt@proctform{mant}%
580   \si@opt@proctform{exp}%

```

The tabformat input should really have both an integer and decimal part for the mantissa. If neither are present, an error is raised. If just the one part is missing, an warning seems more suitable.

```

581   \ifnum\si@tab@mантpostcnt=\z@\relax
582     \ifnum\si@tab@mантprecnt=\z@\relax
583       \si@log@err{Empty mantissa argument for tabformat}
584         {The argument '#1' contains no valid entry for
585          a mantissa\MessageBreak It should be of the
586          form 'm.n', where m and n are integers}%
587     \else
588       \si@log@warn{Argument of tabformat contains\MessageBreak
589         no decimal part}%
590     \fi
591   \else
592     \ifnum\si@tab@mантprecnt=\z@\relax
593       \si@log@warn{Argument of tabformat contains\MessageBreak
594         no integer part}%
595     \fi
596   \fi

```

If `\tabformat` has been given with `\tabnumalign=centre decimal active`, then the alignment is changed to centred.

```
597   \ifsi@tab@fixed\else
598     \sisetup{\tabnumalign=centre}%
599   \fi
600   \let\pm\si@num@pm
601   \let\mp\si@num@mp}
```

`\si@opt@proctform` Processing the number further uses the `\si@num@digits` macro. The results are stored in the appropriate counter.

```
\si@opt@proctform{\langle mant/exp\rangle}
602 \newcommand*{\si@opt@proctform}[1]{%
603   \renewcommand*{\si@num@predec}{}%
604   \renewcommand*{\si@num@postdec}{}%
605   \si@switchfalse
606   \expandafter\si@ifnotmtarg\expandafter{%
607     \csname si@num@#1\endcsname
608     {\expandafter\expandafter\expandafter\si@num@digits
609      \csname si@num@#1\endcsname\empty\empty}%
610     \csname si@tab@#1\precnt\endcsname\z@\relax
611     \csname si@tab@#1\postcnt\endcsname\z@\relax
612     \ifx\empty\si@num@predec\empty\else
613       \csname si@tab@#1\precnt\endcsname\si@num@predec\relax
614     \fi
615     \ifx\empty\si@num@postdec\empty\else
616       \csname si@tab@#1\postcnt\endcsname\si@num@postdec\relax
617     \fi}
```

The alignment of tabular material when not processed by `\num` needs to be available.

```
618 \si@opt@choicekey{tabtextalign}{left,right,centre,center}
```

`\si@tab@rfill@t` By default, centring happens on both sides of the content of tabular material.

```
\si@tab@lfill@t 619 { \let\si@tab@rfill@t\hfill
620   \let\si@tab@lfill@t\hfill
621   \renewcommand*{\si@tempb}{right}%
622   \ifx\si@tempa\si@tempb
623     \let\si@tab@rfill@t\relax
624   \fi
625   \renewcommand*{\si@tempb}{left}%
626   \ifx\si@tempa\si@tempb
627     \let\si@tab@lfill@t\relax
628   \fi}
```

The alignment of unit columns for tabular material has a similar control option.

```
629 \si@opt@choicekey{tabunitalign}{left,right,centre,center}
```

`\si@tab@rfill@s` By default, centring happens on both sides of the content of tabular material.

```
\si@tab@lfill@s 630 { \let\si@tab@rfill@s\hfill
631   \let\si@tab@lfill@s\hfill
632   \renewcommand*{\si@tempb}{right}%
633   \ifx\si@tempa\si@tempb
634     \let\si@tab@rfill@s\relax
```

```

635     \fi
636     \renewcommand*\si@tempb{left}%
637     \ifx\si@tempa\si@tempb
638       \let\si@tab@lfills\relax
639     \fi}

\ifsi@fixdp To allow control of rounding, two options are needed. One sets how many fixed
\si@num@dp digits to use, the second turns this function on and off.

640 \si@opt@boolkey{fixdp}
641 \newcount\si@num@dp
642 \si@opt@key{dp}{%
643   \si@str@ifonlychrs{#1}{0123456789}
644   {}
645   {\si@log@err{Invalid input for dp option}
646    {The dp option must be given a positive integer}}%
647   \si@num@dp#1\relax
648   \si@fixdptrue}

\ifsi@tabautofit To apply rounding automatically in a table, a separate option is used.

649 \si@opt@boolkey{tabautofit}

\ifsi@xspace Unit macros on their own may need xpsace.

650 \si@opt@boolkey{xspace}

\ifsi@prespace

651 \si@opt@boolkey
652 [ \si@unt@numfalse
653   \ifsi@prespace
654     \si@unt@numtrue
655   \fi]
656 {prespace}

\ifsi@allowoptarg For unitsdef users, a method to absorb optional arguments is needed.

657 \si@opt@boolkey{allowoptarg}

\ifsi@frac The option processing for formatting units with \per in them needs two switches.

\ifsi@slash 658 \newif\ifsi@slash
\ifsi@stickyper 659 \newif\ifsi@frac
660 \si@opt@boolkey{stickyper}
661 \si@opt@choicekey[reciprocal]{per}
662 {reciprocal, rp, power, slash, frac, fraction}
663 {\si@slashfalse
664   \si@fracfalse
665   \renewcommand*\si@tempb{slash}%
666   \ifx\si@tempa\si@tempb
667     \si@fractrue
668     \si@slashtrue
669     \let\si@frac\si@frc@slash
670   \fi
671   \renewcommand*\si@tempb{frac}%
672   \ifx\si@tempa\si@tempb
673     \si@fractrue
674   \fi

```

```

675     \renewcommand*\{\si@tempb\}{fraction}%
676     \ifx\si@tempa\si@tempb

21.5 Compatibility options

```

\ifsi@old@ugly With the options for the package set up, the next stage is to provide support for
\ifsi@old@nice users of the older packages. These all set up switches, but do not do anything.
\ifsi@old@loose That is left to the emulation files, loaded at the end of the package. First of all,
\ifsi@old@tight the units options are dealt with; there are not many.
833 \si@opt@compatkey{units}{ugly}
834 \si@opt@compatkey{units}{nice}
835 \si@opt@compatkey{units}{loose}
836 \si@opt@compatkey{units}{tight}

\ifsi@old@OHM The unitsdef package is unfortunately much more profligate with options. The
\ifsi@old@ohm first set are to do with support for gensymb.
\ifsi@old@redef-gensymb 837 \si@opt@compatkey{unitsdef}{OHM}
\ifsi@gensymb 838 \si@opt@compatkey{unitsdef}{ohm}
839 \si@opt@compatkey{unitsdef}{redef-gensymb}
840 \newif\ifsi@gensymb

```

\ifsi@old@LITER The second set are more general functionality.

```
\ifsi@old@liter 841 \si@opt@compatkey{unitsdef}{LITER}
\ifsi@old@noinspace 842 \si@opt@compatkey{unitsdef}{liter}
\ifsi@old@noconfig 843 \si@opt@compatkey{unitsdef}{noinspace}
844 \si@opt@compatkey{unitsdef}{noconfig}
```

\ifsi@old@noabbr The final set are for control of abbreviations, and are a good demonstration of why to use **xkeyval**!

```
\ifsi@old@nofreqencyabbr 845 \si@opt@compatkey{unitsdef}{noabbr}
\ifsi@old@nomolabbr 846 \si@opt@compatkey{unitsdef}{noampereageabbr}
\ifsi@old@novoltageabbr 847 \si@opt@compatkey{unitsdef}{nofreqencyabbr}
\ifsi@old@novolumeabbr 848 \si@opt@compatkey{unitsdef}{nomolabbr}
\ifsi@old@noweightabbr 849 \si@opt@compatkey{unitsdef}{novoltageabbr}
\ifsi@old@noenergyabbr 850 \si@opt@compatkey{unitsdef}{novolumeabbr}
851 \si@opt@compatkey{unitsdef}{noweightabbr}
\ifsi@old@nolengthabbr 852 \si@opt@compatkey{unitsdef}{noenergyabbr}
\ifsi@old@notimeabbr 853 \si@opt@compatkey{unitsdef}{nolengthabbr}
854 \si@opt@compatkey{unitsdef}{notimeabbr}
```

\ifsi@old@cdot The Slunits package has lots of options. These ones are all related to spacing.

```
\ifsi@old@thickspace 855 \si@opt@compatkey{SIunits}{cdot}
\ifsi@old@mediumspace 856 \si@opt@compatkey{SIunits}{thickspace}
\ifsi@old@thinspace 857 \si@opt@compatkey{SIunits}{mediumspace}
\ifsi@old@thickqspace 858 \si@opt@compatkey{SIunits}{thinspace}
\ifsi@old@mediumqspace 859 \si@opt@compatkey{SIunits}{thickqspace}
\ifsi@old@thinqspace 860 \si@opt@compatkey{SIunits}{mediumqspace}
861 \si@opt@compatkey{SIunits}{thinqspace}
```

\ifsi@old@amssymb These options are used by Slunits to control clashes with other packages.

```
\ifsi@old@squaren 862 \si@opt@compatkey{SIunits}{amssymb}
\ifsi@old@pstricks 863 \si@opt@compatkey{SIunits}{squaren}
\ifsi@old@Gray 864 \si@opt@compatkey{SIunits}{pstricks}
\ifsi@old@italian 865 \si@opt@compatkey{SIunits}{Gray}
866 \si@opt@compatkey{SIunits}{italian}
```

\ifsi@old@textstyle The miscellaneous options.

```
\ifsi@old@binary 867 \si@opt@compatkey{SIunits}{textstyle}
\ifsi@old@noams 868 \si@opt@compatkey{SIunits}{binary}
\ifsi@old@derivedinbase 869 \si@opt@compatkey{SIunits}{noams}
\ifsi@old@derived 870 \si@opt@compatkey{SIunits}{derivedinbase}
871 \si@opt@compatkey{SIunits}{derived}
```

\ifsi@old@noprefixcmds The hepunits package only has one option.

```
872 \si@opt@compatkey{hepunits}{noprefixcmds}
```

\ifsi@old@english **fancynum** provides a few options. First the rather oddly named **english** and **french** ones.

```
873 \si@opt@compatkey{fancynum}{english}
874 \si@opt@compatkey{fancynum}{french}
```

\ifsi@old@tight A couple for spacing multiplication.

```
\ifsi@old@loose 875 \si@opt@compatkey{fancynum}{tight}
876 \si@opt@compatkey{fancynum}{loose}
```

```

\ifsi@old@thinspace Three for digit separation.
\ifsi@old@commas 877 \si@opt@compatkey{fancynum}{thinspace}
\ifsi@old@plain 878 \si@opt@compatkey{fancynum}{commas}
879 \si@opt@compatkey{fancynum}{plain}

\ifsi@old@spaceqspace The fancyunits package provides one option not available with Slunits.
880 \si@opt@compatkey{fancyunits}{spaceqspace}

21.6 Constants

A number of macros are needed by the package that provide a non-changing output. These are defined here; the intention is that these should not be macros that the user is likely to need to alter. All of these macros have preface \si@fix@, to flag that they are intended as constants. The package may rely on the contents of these macros for functionality.

\si@fix@thin First, there are the various space macros. To allow both med and medium to be used as a space description, two macros are needed for the same output.
\si@fix@med
\si@fix@medium 881 \newcommand*{\si@fix@thin}{\,}
\si@fix@thick 882 \newcommand*{\si@fix@med}{\:}
\si@fix@space 883 \newcommand*{\si@fix@medium}{\:}
884 \newcommand*{\si@fix@thick}{\;}
885 \newcommand*{\si@fix@space}{\text{ } }

\si@fix@cdot Next there are macros for material that is not simply whitespace. To allow several options, the full-stop gets lots of names.
\si@fix@comma
\si@fix@stop 886 \newcommand*{\si@fix@cdot}{{}\cdotp{}}
\si@fix@fullstop 887 \newcommand*{\si@fix@comma}{{},{}}
\si@fix@period 888 \newcommand*{\si@fix@stop}{{}.{}}
\si@fix@times 889 \newcommand*{\si@fix@fullstop}{{}.{}}
\si@fix@tighttimes 890 \newcommand*{\si@fix@period}{{}.{}}
\si@fix@tightcdot 891 \newcommand*{\si@fix@times}{\times}
892 \newcommand*{\si@fix@tighttimes}{\bgroup\times\egroup}
893 \newcommand*{\si@fix@tightcdot}{\bgroup\cdotp\egroup}

\si@fix@plus Signs for numbers are needed.
\si@fix@minus 894 \newcommand*{\si@fix@plus}{+}
\si@fix@pm 895 \newcommand*{\si@fix@minus}{-}
\si@fix@tightpm 896 \newcommand*{\si@fix@pm}{\pm}
\si@fix@mp 897 \newcommand*{\si@fix@tightpm}{\bgroup\pm\egroup}
898 \newcommand*{\si@fix@mp}{\mp}

\si@fix@two The literals “z” and “10” are needed for exponents.
\si@fix@ten 899 \newcommand*{\si@fix@two}{2}
900 \newcommand*{\si@fix@ten}{10}

\si@fix@slash Another optional component that will probably not be used by many people.
901 \newcommand*{\si@fix@slash}{/}

\si@fix@none Finally for spacing, there is the possibility of nothing at all
902 \newcommand*{\si@fix@none}{}

```

21.7 Symbols

\si@symbol Each of the symbol macros needs to be set up; the options give a maths and text mode sign, but internally a single macro is needed for each.

```
903 \newcommand*{\si@symbol}[1]{%
904   \expandafter\protected\expandafter\def
905   \csname si@sym@\#1\endcsname{%
906     \ifmmode
907       \expandafter\csname si@maths#1\expandafter\endcsname
908     \else
909       \expandafter\csname si@text#1\expandafter\endcsname
910     \fi}}
```

\si@sym@Omega The various symbols are now declared.

```
\si@sym@ringA 911 \si@symbol{Omega}
  \si@sym@mu 912 \si@symbol{ringA}
\si@sym@degree 913 \si@symbol{mu}
\si@sym@minute 914 \si@symbol{degree}
\si@sym@second 915 \si@symbol{minute}
\si@sym@celsius 916 \si@symbol{second}
  917 \si@symbol{celsius}
```

The issue of redefinition of symbols now arises. `siunitx` can check for the loading of a number of support package, and can then redefine the appropriate symbols.

```
918 \AtBeginDocument{%
919   \ifsii@redefsymbols
920     \@ifpackageloaded{textcomp}{%
921       {\si@log@debug{Redefining symbols using textcomp}}%
922       \renewcommand*{\si@textdegree}{\textdegree}%
923       \renewcommand*{\si@mathsdegree}{\text{\textdegree}}%
924     }
925     \renewcommand*{\si@textmu}{\textmu}%
926     \renewcommand*{\si@textOmega}{\textohm}%
927   }
928 }
```

The Å symbol is only redefined if the encoding is OT1; other encodings should have a proper glyph used for \AA. The \encodingdefault macro is \long for some reason.

```
927   \renewcommand*{\si@tempa}{OT1}%
928   \ifx\si@tempa\encodingdefault
929     \renewcommand*{\si@mathsringA}{%
930       \text{\capitalring{A}}}%
931     \renewcommand*{\si@textringA}{\capitalring{A}}
932   \fi}%
933   \@ifpackageloaded{upgreek}{%
934     {\si@log@debug{Redefining symbols using upgreek}}%
935     \renewcommand*{\si@mathsmu}{\upmu}%
936     \renewcommand*{\si@mathsOmega}{\Upomega}%
937   }
938 }
```

21.8 Handling fractions

\si@frac Various methods of handling fractions are provided.

```
\si@frc@hook
\si@frc@frac
\si@frc@slash
\si@frc@nice
\si@frc@sfrac
```

```

938 \newcommand*{\si@frc@frac}[2]{%
939   \ensuremath{\si@frc@hook\frac{%
940     \expandafter\si@unt@out\expandafter{\#1}}{%
941       \expandafter\si@unt@out\expandafter{\#2}}}}}
942 \let\si@frac\si@frc@frac
943 \newcommand*{\si@frc@hook} {}
944 \newcommand*{\si@frc@slash}[2]{%
945   \expandafter\si@unt@out\expandafter{\#1}%
946   \si@out{\ensuremath{\si@slash}}%
947   \expandafter\si@unt@out\expandafter{\#2}}
948 \newcommand*{\si@frc@nice}[2]{%
949   \ensuremath{\si@frc@nicefrac{\expandafter\si@unt@out{%
950     \expandafter{\#1}}\expandafter\si@unt@out\expandafter{%
951       \#2}}}}}
952 \newcommand*{\si@frc@sfrac}[2]{%
953   \sfrac{\expandafter\si@unt@out\expandafter{\#1}}{%
954     \expandafter\si@unt@out\expandafter{\#2}}}}
955 \AtBeginDocument{
956   \@ifpackageloaded{xfrac}{}
957   {}%
958   {\si@log@inf{xfrac package unavailable}\MessageBreak
959    using `fraction=sfrac' will fall back on\MessageBreak
960    nicefrac-like method}%
961   \renewcommand*{\si@frc@sfrac}[2]{%
962     \si@log@warn{xfrac package unavailable}%
963     \si@frc@nice{\#1}{\#2}}}

```

\si@frc@nicefrac To avoid needing units installed, the \nicefrac macro needs to be emulated here. The code is taken (with permission) from kgnicefrac.⁵²

```

\si@frc@displen 964 \newlength\si@frc@displen
\si@frc@textlen 965 \newlength\si@frc@textlen
\si@frc@suplen 966 \newlength\si@frc@suplen
967 \newlength\si@frc@ssuplen
968 \newcommand*{\si@frc@nicefrac}{%
969   \ifmmode

1012             \hspace{-0.25ex}/\hspace{-0.25ex}%
1013             \hbox{\fontsize\sf@size\z@\selectfont{#2}}%
1014         \endgroup
1015 }
```

\si@frc@ugly The \si@frc@ugly macro is needed to emulate the ugly option in units, where output depends on the current mode.

```

1016     \si@frc@ugly{\langle numerator\rangle}
1017     \newcommand*{\si@frc@ugly}[1]{%
1018         \renewcommand*{\si@tempa}{#1}%
1019         \ifmmode
1020             \expandafter\si@frc@frac
1021         \else
1022             \renewcommand*{\si@tempb}{1}%
1023             \ifx\si@tempa\si@tempb
```

The slash switch cannot be used, so the possibility of the numerator being one is handled here.

```

1024     \setbox\si@tempboxa=\hbox{\ensuremath{\si@valuesep}}%
1025     \hskip-\wd\si@tempboxa\relax
1026     \renewcommand*{\si@tempa}{}%
```

```

1027     \fi
1028     \expandafter\si@frc@slash
1029   \fi
1030 { \si@tempa } }
```

21.9 Font control

A number of controls and tests are needed to control the font used for output. Underlying all of this is the *AMS* package *amstext* package, providing the *\text* command. Much of the font control system here is taken more or less verbatim from *Slstyle*; modifications have been made to fit the *siunitx* interface.

\si@fam@sf The package needs to know the maths font families in use. This is set right at the start of the document, after any changes can have been made by, for example, *fontspec*.

```

1031 \g@addto@macro{\document}{%
1032   \ifdefined\mathsf
1033     \setbox\si@tempboxa=\hbox{%
1034       $\mathsf{\global\chardef\si@fam@sf=\fam}$_%
1035     \else
1036       \si@log@inf{\string\mathsf not found}%
1037       \global\chardef\si@fam@sf=99\relax
1038     \fi
1039   \ifdefined\mathtt
1040     \setbox\si@tempboxa=\hbox{%
1041       $\mathtt{\global\chardef\si@fam@tt=\fam}$_%
1042     \else
1043       \si@log@inf{\string\mathtt not found}%
1044       \global\chardef\si@fam@tt=99\relax
1045     \fi}
```

\si@fam@ifbtext These tests check for bold in text and maths mode, respectively.

```

\si@fam@ifbmaths \si@fam@ifbtext {\code}
\si@fam@ifbmaths {\code}

1046 \newcommand*{\si@fam@ifbtext}[1]{%
1047   \if b\expandafter\@car\f@series\@nil
1048     #1\fi}
1049 \newcommand*{\si@fam@ifbmaths}[1]{%
1050   \renewcommand*{\si@tempa}{bold}%
1051   \ifx\math@version\si@tempa
1052     #1\fi}
```

\si@fam@ifbinline For compatibility with *units*, a method to change the behaviour when in inline maths is needed for the bold detector.

```

1053 \newcommand*{\si@fam@ifbinline}{%
1054   \ifsi@inlinebtext
1055     \expandafter\si@fam@ifbtext
1056   \else
1057     \expandafter\si@fam@ifbmaths
1058   \fi}
```

\si@fam@ifitext This test check for italic or slanted text in text mode, by negation (upright text is n).

```
1059 \newcommand*{\si@fam@ifitext}[1]{%
1060   \if n\expandafter\@car\f@series\@nil\else
1061     #1\fi}
```

\si@fam@mode Detection of the current mode needs to happen “early” (before any change of \ensuremath). So a short macro is provided to do the job.

```
1062 \newcommand*{\si@fam@mode}{%
1063   \ifsi@obeymode
1064     \ifmmode
1065       \sisetup{mode=maths}%
1066     \else
1067       \sisetup{mode=text}%
1068     \fi
1069 }
```

\si@fam@colourcmd The colour command is set up.

```
1070 \AtBeginDocument{%
1071   \@ifpackageloaded{color}%
1072     {\let\si@fam@colourcmd\color}%
1073     {\let\si@fam@colourcmd\@gobble} }
```

\ifsi@fam@set A marker is set up to check if font-matching has been taken place. A second flag \ifsi@textmode is used to track the use of text mode.

```
1074 \newif\ifsi@fam@set
1075 \newif\ifsi@textmode
```

\si@fam@set Using the code from `SIstyle` as a base, a set of tests are used to set the current font families and weights. To begin with, the mode to use is set up.

```
1076 \newcommand*{\si@fam@set}{%
1077   \ifsi@out@num
1078     \ifsi@numtextmode
1079       \expandafter\expandafter\expandafter\si@textmodetrue
1080     \else
1081       \expandafter\expandafter\expandafter\si@textmodefalse
1082     \fi
1083   \else
1084     \ifsi@unittextmode
1085       \expandafter\expandafter\expandafter\si@textmodetrue
1086     \else
1087       \expandafter\expandafter\expandafter\si@textmodefalse
1088     \fi
1089 }
```

\si@mathsrm The appropriate font macros are now established, if necessary.

```
\si@mathssf1090 \ifsi@fam@set\else
\si@mathstt1091   \let\si@colourcmd\@gobble
\si@textrm1092   \ifsi@out@num
\si@textsf1093     \let\si@mathsrm\si@valuemathsrm
\si@texttt1094     \let\si@mathssf\si@valuemathssf
\si@colourcmd1095   \let\si@mathstt\si@valuemathstt
\si@colour
```

```

1096      \let\si@textrm\si@valuetextrm
1097      \let\si@textsf\si@valuetextsf
1098      \let\si@texttt\si@valuetexttt
1099      \ifsi@colourvalues
1100          \let\si@colourcmd\si@fam@colourcmd
1101      \fi
1102      \let\si@colour\si@valuecolour
1103  \else
1104      \let\si@mathsrm\si@unitmathsrm
1105      \let\si@mathssf\si@unitmathssf
1106      \let\si@mathstt\si@unitmathstt
1107      \let\si@textrm\si@unitextrm
1108      \let\si@textsf\si@unittextsf
1109      \let\si@texttt\si@unittexttt
1110      \ifsi@colourunits
1111          \let\si@colourcmd\si@fam@colourcmd
1112      \fi
1113      \let\si@colour\si@unitcolour
1114  \fi
1115 \fi
1116 \si@fam@settrue

```

The temporary macros are needed for the `\ifx` tests, which need to be expanded once.

```

1117 \edef\si@tempa{\sfdefault}%
1118 \edef\si@tempb{\ttdefault}%

```

`\si@fam@maths` The surrounding font family is only tested if matching is requested. First, the `\si@fam@text` defaults are set up assuming no detection takes place.

```

1119 \expandafter\let\expandafter\si@fam@maths
1120     \csname\si@mathsrm\endcsname
1121 \expandafter\let\expandafter\si@fam@text
1122     \csname\si@textrm\endcsname
1123 \ifsi@obeyfamily
1124     \si@log@debug{Font detection: checking font}%

```

The detection code has to check the mode currently in operation. Display mathematics can be handled in two ways, so this means some code is repeated: it is spun out to separate routines.

```

1125 \ifmmode
1126     \ifinner
1127         \si@log@debug{Font detection: inline maths}%
1128         \si@fam@dettext
1129     \else
1130         \si@log@debug{Font detection: display maths}%
1131         \ifsi@detectdisplay
1132             \si@fam@detmaths
1133         \else
1134             \si@fam@dettext
1135         \fi
1136     \fi
1137 \else
1138     \si@log@debug{Font detection: text}%

```

```

1139      \si@fam@dettext
1140      \fi
1141  \else
1142      \si@log@debug{Font detection: inactive}%
1143  \fi

```

\si@fam@bold With the font family set, the next check is for bold text. This again needs to examine the current mode. Things are a bit more complex than in `S\style` as it is possible to be typesetting in either text or maths mode. The bold command is set up with `\def`, as nested calls can occur.

```

1144  \def\si@fam@bold{\unboldmath\mdseries}%
1145  \ifsi@obeybold
1146      \si@log@debug{Weight detection: checking weight}%
1147      \ifmmode
1148          \ifdim\displaywidth>0pt\relax
1149              \ifsi@detectdisplay
1150                  \expandafter\si@fam@ifbmats
1151              \else
1152                  \expandafter\si@fam@ifbtex
1153              \fi
1154              \si@fam@setbold
1155          \else
1156              \si@fam@ifbinline\si@fam@setbold
1157          \fi
1158      \else
1159          \si@fam@ifbtex\si@fam@setbold
1160      \fi
1161  \fi

```

\si@fam@italic The value of `obeyitalic` is now tested; as this does nothing in maths mode, a reminder is added to the log.

```

1162  \let\si@fam@italic\upshape
1163  \ifsi@obeyitalic
1164      \si@log@debug{Italic detection: checking italic}%
1165      \si@fam@ifitext
1166      {\let\si@fam@italic\relax
1167          \si@log@debug{Italic detection: italic}}%
1168  \fi

```

\si@fam@detmaths Two detection macros are needed for maths and text mode. This allows handling \si@fam@dettext of the various combinations without needing too many code lines.

```

1169 \newcommand*{\si@fam@detmaths}{%
1170     \ifnum\the\fam=\si@fam@sf

```

21.10 Formatting numbers

\num The system used here is modelled on that in numprint; the input is broken down into single tokens, each one is examined and the result is re-assembled into an output number. However, various changes have been made to the system used, and so the macros here are not simply renamed copies of those in numprint. The user macro \num sets any local keys, then calls the number formatting macro on the processed number.

\num[*options*] {*num*}

```

1217 \si@newrobustcmd*{\num}[2][]{%
1218     \begingroup
1219     \sisetup{\#1}%
1220     \si@fam@mode
1221     \si@num@intabfalse

```

```

1222     \si@log@debug{Processing \string\num\space input '#2'}%
1223     \expandafter\si@out@num\expandafter{\si@num{#2}}%
1224     \endgroup

```

\ifsi@num@intab A flag for processing inside a table is needed.

```
1225 \newif\ifsi@num@intab
```

\si@num This is the main processing macro. Unlike the related macro in numprint, the output of this macro is not subjected to any font changes. That is left to one of the \si@out@... macros. No grouping is applied here; any call to \si@num (or any of the sub-macros) must be within a group as the definitions used rely on this. Grouping is not applied here so that other macros can get the various separated parts of the input.

```
\si@num{\langle num\rangle}
```

```
1226 \newcommand*{\si@num}[1]{%
```

The argument of the macro is fully expanded before any processing. By using \scantokens, any odd problems from packages with active characters can be avoided.

```

1227   \si@num@fixpm
1228   \begingroup
1229     \makeatletter
1230     \@makeother{\,}%
1231     \@makeother{\.}%
1232     \@makeother{\+}%
1233     \@makeother{\-}%
1234     \def~{}%
1235     \def\,{ }%
1236     \catcode`\~=active\relax
1237     \catcode`\^=active\relax
1238     \everyeof{\noexpand}%
1239     \endlinechar`m@ne
1240     \protected@xdef\si@tempa{\scantokens{#1}}%
1241   \endgroup

```

Processing only takes place if there is actually something in the argument. This is tested once “hard” spaces have been stripped out; if there is input other than spaces, the processor first checks the validity of the input, then moves on to format it.

```

1242   \si@ifnotmtarg{\si@tempa}
1243   {\si@num@ifvalid{\si@tempa}
1244    {\si@num@format{\si@tempa}}}

```

The parser has to bailed-out, and so no further processing of the input is done. Instead, whatever was passed to the macro is returned as supplied.

```

1245   {\si@log@err{Invalid character '#1' in numerical input}%
1246   {Only characters from the list
1247    '\si@numvalid'\MessageBreak should be present in the
1248    argument of the \string\num\space macro\MessageBreak
1249    (or derivative such as an 's' column)}%
1250  {#1}}}}

```

\si@num@fixpm With certain packages loaded, there can be issues with \pm and \mp. To avoid this, the ϵ -TeX \protected system is employed; this is only used within local groups.

```
\pm
\mp
```

```

1251 \newcommand*{\si@num@fixpm}{%
1252   \let\si@num@pm\pm

1289 \renewcommand*{\si@num@exp}{}%
1290 \renewcommand*{\si@num@expsign}{}%
1291 \renewcommand*{\si@num@mant}{}%
1292 \renewcommand*{\si@num@mantsign}{}%
1293 \renewcommand*{\si@num@err}{}%
1294 \renewcommand*{\si@num@xpart}{}%

```

Any “x-part” is now found, leaving the first number in `\si@num@in` and anything else in `\si@num@xpart`.

```

1295 \si@switchfalse
1296 \expandafter\si@num@findxpart\si@num@arg\@empty\@empty

```

The input is split into an mantissa and an exponent; the flag is used here to indicate if an exponent is found. The mantissa will end up in `\si@num@mant`, and the exponent in `\si@num@exp`.

```

1297 \si@switchfalse
1298 \si@num@sepmantexp{\si@num@in}%

```

The sign and value of the mantissa and exponent are separated; the mantissa is done after the exponent as this makes life easier when using the table-formatting fork. Checks are then needed, as a sign with no value is potentially-valid for the mantissa (for example -10^{10}).

```

1299 \si@num@sepsign{exp}%
1300 \si@num@sepsign{mant}%
1301 \ifx\@empty\si@num@exp\@empty
1302   \ifx\@empty\si@num@expsign\@empty\else
1303     \si@log@warn{Sign but no number for '\si@num@arg'}%
1304   \fi
1305   \let\si@num@expsign\@empty
1306 \fi
1307 \ifx\@empty\si@num@mant\@empty
1308   \ifx\@empty\si@num@mantsign\@empty\else
1309     \ifx\@empty\si@num@exp\@empty
1310       \si@log@warn{Sign but no number for '\si@num@arg'}%
1311     \let\si@num@mantsign\@empty
1312   \fi
1313 \fi
1314 \fi

```

A check for negative mantissa values is made, to allow some colour-based trickery.

```

1315 \renewcommand*{\si@tempa}{\{-}\}%
1316 \ifx\si@num@mantsign\si@tempa
1317   \ifsi@colourneg
1318     \expandafter\expandafter\expandafter\si@fam@colourcmd
1319   \else
1320     \expandafter\expandafter\expandafter\@gobble
1321   \fi
1322 \else
1323   \expandafter\@gobble
1324 \fi
1325 {\si@negcolour}%

```

The next stage is to process the remaining data, to find the decimal marker and reformat correctly. These two macros control this entire process. The exponent

is processed first as this makes life easier when the system is used to typeset tabular material.⁵³

```
1326 \si@num@procnum{exp}%
1327 \si@num@procnum{mant}%
```

If the exponent is zero, then if might need to be deleted.

```
1328 \si@str@ifonlychrs{\si@num@exp}{0\si@numdecimal}%
1329 {\ifsi@allowzeroexp\else
1330 \renewcommand*\si@num@exp{}%
1331 \ifx\empty\si@num@mant\empty
1332 \renewcommand*\si@num@mant{1}%
1333 \fi
1334 \fi}{}%
```

To build up the number for typesetting, a rather complex series of tests is needed. First, the “ambiguous error” flag is set if there is an exponent and the package has been asked to check this. The same flag will already be true if a unit is present and checking is active.

```
1335 \ifx\empty\si@num@exp\empty\else
1336 \ifsi@trapambigerr
1337 \expandafter\expandafter\expandafter\si@num@ambigerrtrue
1338 \fi
1339 \fi
```

`\si@num@out` Processing now divides, as when used with the S column some extra steps are needed. Inside a table, the macro `\si@tab@out` holds the part of the mantissa before the decimal sign. The post-decimal part then ends up in `\i@num@out`. On the other hand, under normal circumstances the entire mantissa should be copied to `\si@num@out`.

```
1340 \protected@edef\si@num@out{%
1341 \ensuremath{{\si@num@mantsign}}\si@num@mant}%
1342 \renewcommand*\si@tempa{num}%
1343 \ifsi@num@intab
1344 \protected@edef\si@tab@out{%
1345 \ensuremath{{\si@num@mantsign}}\si@num@predec}%
1346 \protected@edef\si@num@out{\si@num@postdec}%
1347 \renewcommand*\si@tempa{tab}%
1348 \fi
```

Now there is the error part to handle. For tables, a check has to be made so the error ends up in the correct part of the number. The value of `\si@tempa` is used to track this., and so is set up here.

```
1349 \ifx\empty\si@num@postdec\empty\else
1350 \renewcommand*\si@tempa{num}%
1351 \fi
1352 \ifx\empty\si@num@err\empty\else
```

If there is an error, and it is begin separated, the problem arises of the potential for ambiguous values. This can only apply outside of a table, as `seperr` is disabled in tabular material.

```
1353 \ifsi@seperr
1354 \ifsi@num@ambigerr
1355 \protected@edef\si@num@out{%
```

⁵³The contents of `\si@num@predec` and `\si@num@postdec` are needed for the mantissa.

```

1356          \ensuremath{\si@openerr}\si@num@out}%
1357          \si@repeatunitsfalse
1358          \expandafter\si@num@erropentru
1359      \else

```

If there is an exponential part and an error, errors are being separated and ambiguous errors are not trapped, then there is work to do. The exponent part is added to the *error*, and deleted from the mantissa if necessary.

```

1360          \ifsi@trapambigerr\else
1361              \ifx\@empty\si@num@exp\@empty\else
1362                  \protected@edef\si@num@err{%
1363                      \si@num@err\expandafter\@car\si@numexp\@nil
1364                      \si@num@expsign\si@num@exp}%

1594         \si@num@addpostzero
1595     \fi
1596   \fi
1597 \fi

```

The next checks to make concern input validity in a more mathematical sense. First, if the number is zero, then no sign should be given under any circumstances. Then leading zeros need to be removed from the input. This is slightly complicated by the potential presence of “extra” characters.

```
1598 \si@num@unsign{\#1}%
1599 \ifx\@empty\si@num@predec\@empty
1600 \else
1601   \expandafter\si@num@nozero
1602 \fi
```

A sanity check is made to ensure that the supplied number consisted of more than a decimal marker.

```
1603 \ifx\@empty\si@num@predec\@empty
1604   \ifx\@empty\si@num@postdec\@empty
1605     \expandafter\expandafter\expandafter\gobble
1606   \else
1607     \expandafter\expandafter\expandafter\si@num@sepdigits
1608   \fi
1609 \else
1610   \expandafter\si@num@sepdigits
1611 \fi
1612 {\#1} }
```

\si@num@digits The \si@num@digits macro compares each character in the input against the list of characters valid at this stage: numbers, decimal markers and “extra” characters. \si@num@digits<char><chars>\@empty
 \si@num@pre \si@num@pre{\<num>}
 \si@num@post \si@num@post{\<num>}
 \si@num@prepost \si@num@prepost{\<num>} {\<pre/post>} {\<text>} }

```
1613 \def\si@num@digits#1#2\@empty{%
1614   \si@str@ifchrstr{\#1}{\si@numdecimal}
1615   {\ifsi@switch

\si@ang@killdegree A mechanism is needed to handle moving the angle unit signs for the astroang
\si@ang@killminute option. This requires two steps, producing the sign over the decimal sign and
\si@ang@killsecond preventing duplicate symbols appearing. This is based on a suggestion from
\si@ang@astrosign Morten Høgholm, but using TeX internals as \makebox does not work here.
\si@ang@decimalsymbol Note the need to correct for \scriptspace (thanks to Donald Arseneau for
that).

21.12 Tabular material

The automatic formatting and alignment of numerical data in columns is handled here. The various other packages that work in this area are basically ripped-off here. The letters `D`, `N` and `R` are already taken by the other packages for numerical alignment, and so `S` (= `siunitx`) is chosen for the alignment of numerical material. The package also provides a second column type, `s`, for units (the letter is taken from `\si`).

- `\NC@list` The first part of the job is to create the basic apparatus for the columns using the `array` package. To prevent any issues with the content of optional arguments to the new columns, so rearrangement is needed. The `siunitx` columns have to come *before* any other column definitions. This is achieved by saving `\NC@list`, creating the columns then restoring the list with the appropriate extra parts.

```

2288 \edef\si@tempa{%
2289   \noexpand\NC@do S\noexpand\NC@do s\the\NC@list}
2290 \newcolumntype{S}{}%
2291 \newcolumntype{s}{}%
2292 \NC@list\expandafter{\si@tempa}

```

- `\NC@rewrite@s` Following the numprint approach, the `\NC@rewrite@...` macros are rewritten to collect the cell contents. This means messing with the internal macros of another package, but there is no other way to do this. As `array` is a standard package from the tools bundle, this should be reasonably safe. Here the begin and end code needed is added to the existing list if `\@temptokena`, with the start and end macros unexpanded. Argument #1 contains any user setup options for this column. Passing an argument at this stage will cause issues, so each column type needs its own begin and end macros.

```

\NC@rewrite@s [〈options〉] \NC@rewrite@s [〈options〉]

2293 \renewcommand*{\NC@rewrite@s}[1][]{%
2294   \edef\si@tempa{\the\@temptokena
2295     >{\noexpand\si@tab@begin@s[#1]}c%
2296     <{\noexpand\si@tab@end@s}}%
2297   \@temptokena\expandafter{\si@tempa}%
2298 \NC@find}
2299 \renewcommand*{\NC@rewrite@s}[1][]{%
2300   \edef\si@tempa{\the\@temptokena
2301     >{\noexpand\si@tab@begin@s[#1]}c%

```

```

2302      <{\noexpand\si@tab@end@s}%
2303      \atemptokena\expandafter{\si@tempa}%
2304      \NC@find}

\si@tab@begin@s At this stage, the appropriate token gathering macro is activated, and the common
\si@tab@begin@s starting macro is called. For the S column, the seperr is turned off, and an error
\si@tab@gettok is set to be raised by any "x-part" input.
\si@tab@begin@S[<options>]
\si@tab@begin@s[<options>]

2305 \newcommand*{\si@tab@begin@S}[1][]{%
2306   \si@log@debug{Processing S column cell contents}%
2307   \let\si@tab@gettok\si@tab@gettok@S
2308   \si@seperrfalse
2309   \renewcommand*{\si@num@sepxpath}{%
2310     \si@log@err{Multiple numbers not allowed in
2311       tables\MessageBreak Only the first number used}
2312     \@ehb}%
2313   \si@tab@begin[#1]}
2314 \newcommand*{\si@tab@begin@s}[1][]{%
2315   \si@log@debug{Processing s column cell contents}%
2316   \let\si@tab@gettok\si@tab@gettok@s
2317   \si@tab@begin[#1]}

\si@tab@toks Some storage is needed for the data to build up. In common with rccol and
\si@tab@pretoks numprint, token registers are used for this (thus leaving problematic input to be
\si@tab@posttoks handled later).
2318 \newtoks\si@tab@toks
2319 \newtoks\si@tab@pretoks
2320 \newtoks\si@tab@posttoks

\si@tab@begin The macro for gathering up input is common to both column types. It uses the
method for rccol; the cell contents are collected by a second macro, which then
stores all of the data in an appropriate token store.
\si@tab@begin[<options>]

2321 \newcommand*{\si@tab@begin}[1][]{%
2322   \begingroup
2323   \sisetup{#1}%
2324   \si@tab@toks{}%
2325   \si@tab@pretoks{}%
2326   \si@tab@posttoks{}%
2327   \si@switchfalse
2328   \si@tab@gettok}

\si@tab@gettok@S The two collection macros are very similar. Both compare the current input with
\si@tab@othertok a list of possible fixed values; this is pretty much a direct copy of numprint. If the
\si@tab@gettok@s input is not on the list of choices, it is processed as data for siunitx to handle. The
\si@tab@next S column does an additional check, to allow division of a number from any text.
For the s column, everything gets added to \si@tab@toks for later processing.
Two separate macros are needed here as the fixed values are dependant on the
column type, and awkward errors pop up if a combined approach is tried.
\si@tab@gettok@S{<cell-contents>}

2441   \tabularnewline}

\si@tempcnda The second part of the tabular code is concerned with typesetting numbers
\si@tempcntb in S columns with the appropriate alignment. Counters are needed for the
digit-counting system.
2442 \newcount\si@tempcnda
2443 \newcount\si@tempcntb

\si@tab@numout If a number is found, then some secondary processing is needed to format it
correctly.
2444 \newcommand*{\si@tab@numout}{%
2445   \si@num@intabtrue
2446   \ifsi@tab@fixed
2447     \ifsi@tabautofit
2448       \si@num@dp\si@tab@mантпostcnt\relax
2449       \expandafter\expandafter\expandafter\si@fixdptrue
2450     \fi
2451   \fi
2452   \expandafter\si@num\expandafter{\the\si@tab@toks}%
2453   \si@tab@format}

\si@tab@prebox The various boxes needed for the column centring are declared. Unlike the
\si@tab@postbox dcolumn original, private boxes are used here. \si@tempboxa is used when a
\si@tab@midbox space to measure one of the constituents is needed; it is never used for output.
\si@tab@expbox
2454 \newbox\si@tab@prebox
2455 \newbox\si@tab@midbox
2456 \newbox\si@tab@postbox
2457 \newbox\si@tab@expbox

\si@tab@format The formatting set up is taken from dcolumn, but with control of the output form
the stored information. The choice of a variable (decimal-centred) column or
fixed width boxes is made.
2458 \newcommand*{\si@tab@format}{%
2459   \ifsi@tab@fixed

```

```

2460      \expandafter\si@tab@fixed
2461  \else
2462      \expandafter\si@tab@unfixed
2463  \fi
A hack to get the correct colour everywhere without too much work.
2464  \ifsi@colourvalues

21.13 Units

- \SI \si There are two types of user macros for the units system; those for defining new units, prefixes and powers, and those for using them. There are two macros for using units, `\SI` and `\si`, which work in very similar ways. `\si` is just an alias for `\SI` with no number; everything is handed off into an internal macro. The internal macro also handles the optional prefix argument to `\SI`
- ```
2580 \SI[⟨options⟩]{⟨num⟩} \si[⟨options⟩]{⟨unit⟩}
2581 \@ifnextchar[%]
2582 {\si@SI[#1]{#2}}
2583 {\si@SI[#1]{#2}[]}
2584 \si@newrobustcmd*\{\si[2][]{\si@SI[#1]{}[]}{#2}\}
```
- \newunit \renewunit \provideunit The `\newunit` and `\renewunit` macros create the new unit macros. To allow a mechanism for checking an existing definition, these macros simply carry out the appropriate tests, before handing off to the internal macro. `\@ifdefinable` is not used here as a customised error is desirable. Other than that, the code here gives very similar results to `\newcommand` and `\renewcommand`. Finally, `\provideunit` adds the unit definition only if it does not already exist.
- ```
2585 \newunit[⟨options⟩]{⟨unit⟩}{⟨symbol⟩}
2586 \renewunit[⟨options⟩]{⟨unit⟩}{⟨symbol⟩}
2587 \provideunit[⟨options⟩]{⟨unit⟩}{⟨symbol⟩}

2588 \newcommand*\newunit[3][]{%
2589   \si@ifdefinable{#2}
2590   {\si@unt@defunit[#1]{#2}{#3}}
2591   {\si@log@err{Unit \string#2 already defined!}\@eha}
2592   \newcommand*\renewunit[3][]{%
2593     \si@ifdefinable{#2}
2594     {\si@log@err{Unit \string#2 undefined}\@ehc
2595     \si@unt@defunit[#1]{#2}{#3}}
2596     {\si@log@inf{Redefining unit \string#2}%
2597     \si@unt@defunit[#1]{#2}{#3}}}
2598   \si@ifdefinable{#2}
2599   {\si@unt@defunit[#1]{#2}{#3}}
2600 }
```
- \newprefix \renewprefix \provideprefix The multiples of units are defined here; very similar code is used to the `\newunit`, etc., macros. The multiple prefixes cannot take an optional argument, and must represent some power. Hence the arguments required are different. `\newprefix[⟨binary⟩]{⟨multiple⟩}{⟨powers-ten⟩}{⟨symbol⟩}`
- ```
2601 \renewprefix[⟨binary⟩]{⟨multiple⟩}{⟨powers-ten⟩}{⟨symbol⟩}
2602 \provideprefix[⟨binary⟩]{⟨multiple⟩}{⟨powers-ten⟩}{⟨symbol⟩}

2603 \newcommand*\newprefix[4][]{%

2680 \si@unt@cntx#2\@empty\@empty
2681 \fi}

```

\si@unt@ifliteral \iifsi@unt@littest The next stage of the processor is to determine whether or not the argument of the unit macro is processable. For literal arguments, this is not the case, and the argument is typeset “as is”. On the other hand, any units, *etc.*, declared by the package will work with the processor, and so need to be executed before

typesetting the result.

```
2681 \si@unt@ifliteral{\text{}}
2682 \newif\ifsi@unt@littest
2683 \newcommand*{\si@unt@ifliteral}[1]{%
2684 \begingroup
2685 \si@unt@littesttrue
```

The test relies on any non-processable test having some width; hopefully, this should be the case.

```
2686 \setbox\si@tempboxa=\hbox{\si@unt@out{\#1}}%

```

\si@unt@out The final part of the units system is the output routine. This has to cope with units not only as macros but also as direct input (S<sub>l</sub>style-type input). Non-Latin characters are also handled cleanly. As usual, \scantokens is used to make life easier.

```

\si@unt@out {<unit>}
3170 \begingroup
3171 \catcode`\~=active
3172 \catcode`\.=active
3173 \gdef\si@unt@out#1{%
3174 \begingroup
3175 \si@unt@nonlatin
3176 \makeatletter
3177 \catcode`\~=active
```

```

3178 \catcode`\.=\active
3179 \def~{\ensuremath{(\si@unitspace)}}
3180 \def.{\ensuremath{(\si@unitsep)}}
3181 \endlinechar\m@ne
3182 \si@out{\scantokens{#1}}
3183 \endgroup
3184 \endgroup

```

`\si@unt@nonlatin` To handle non-Latin symbols in the input, a single macro is provided. If X<sub>E</sub>T<sub>E</sub>X is in use, this can be detected immediately.

```

3185 \newcommand*{\si@unt@nonlatin} {}
3186 \ifdefined\XeTeXrevision
3187 \renewcommand*{\si@unt@nonlatin}{%
3188 \catcode176=\active
3189 \catcode181=\active
3190 \catcode197=\active
3191 \si@unt@sym{176}{\si@sym@degree}%
3192 \si@unt@sym{181}{\si@sym@mu}%
3193 \si@unt@sym{197}{\si@sym@ringA}}%
3194 \fi

```

If `inputenc` has been loaded, then a check is made that the encoding is correct. If all is well, the non-Latin symbols are handled. The degree symbol is character 176, the micro symbol is character 181 and ring capital A is character 197 in latin1.

```

3195 \AtBeginDocument{
3196 \@ifpackageloaded{inputenc}

```

## 21.15 Output routine

\si@out With all of the setup done, the text can finally be typeset. This is done inside a \text block, which takes care of \ensuremath, etc. First of all, the various catcode settings needed to get maths-in-text mode are made. \makeatletter is needed so that \scantokens still allows internal macros to work.

```

3300 \begingroup
3301 \catcode`^=\active\relax
3302 \catcode`-=\active\relax
3303 \gdef\si@out#1{%
3304 \begingroup
3305 \catcode`^=\active\relax
3306 \makeatletter
3307 \endlinechar\m@ne

```

The various font families can now be set up. First a check is made in case there are nested calls to \si@out@text.

```

3308 \ifsi@fam@set\else
3309 \expandafter\si@fam@set
3310 \fi
3311 \si@colourcmd{\si@colour}%
3312 \text{\si@fam@italic\si@fam@bold\si@fam@text}

```

The correct mode is selected, and the input is handed off for typesetting.

```

3313 \ifsi@textmode
3314 \expandafter\si@out@text
3315 \else
3316 \expandafter\si@out@maths
3317 \fi
3318 {\scantokens{#1}}%
3319 \endgroup
3320 \check@mathfonts

```

\si@out@text Output occurs with the correct changes to superscript behaviour.

```

\si@out@maths \si@out@text{\text{<math>}}
\si@out@maths{\text{<math>}}
3321 \gdef\si@out@text#1{%
3322 \let^{\si@out@sp}
3323 \let\si@out@sp
3324 \catcode`-=\active\relax
3325 \let-\si@out@minus
3326 #1}
3327 \gdef\si@out@maths#1{%
3328 \let^{\sp}
3329 \let\sp
3330 $\si@fam@maths{#1}$}
3331 \endgroup

```

\si@out@sp \textsuperscript gives slightly different alignment of numbers to using  $^$  in text mode. To avoid this, a slightly different definition is used. Elsewhere \textsuperscript is used, as the code above sorts out the text/math mode issues.

```
\si@out@sp{\text{<math>}}
```

```

3332 \newcommand*{\si@out@sp}{[1]{\ensuremath{^{\text{\#1}}}}}

\si@out@minus An active minus sign is needed.
3333 \newcommand*{\si@out@minus}{\ensuremath{-} }

\ifsi@out@num A flag is needed to control output settings. This will be false unless inside
\si@out@num.
3334 \newif\ifsi@out@num

\si@out@num For numerical output, the default fonts are controlled slightly differently to text
output.
\si@out@num{\langle num\rangle}
3335 \newcommand*{\si@out@num}{[1]{%
3336 \begingroup
3337 \si@out@numtrue
3338 \si@out{\#1}%
3339 \endgroup
}

21.16 Finalisation

\si@extension To keep the code easy to maintain, the reusable filename components are macros
\si@fileprefix rather than literals.
3340 \newcommand*{\si@extension}{cfg}
3341 \newcommand*{\si@fileprefix}{si-}

\si@ifl@aded A bit of borrowing from the LATEX kernel. A copy of \ifl@aded is needed as
\si@ifloaded things aren't always done in the preamble by siunitx.
\si@ifloaded{\langle package\rangle}
3342 \newcommand*{\si@ifl@aded}{}
3343 \let\si@ifl@aded\ifl@aded
3344 \newcommand*{\si@ifloaded}{[1]{%

3505 {}
3506 \si@catcodes
```

## 22 Loadable modules

To keep the package relatively clear, and to make maintenance easier, the only units defined in the package itself are the base units. Everything else is a loadable module (similar to the approach in `unitsdef`).

### 22.1 Multiple prefixes

\yocto The various SI multiple prefixes are defined here. First the small powers.

```
\zepto3507 \ProvidesFile{si-prefix.cfg}
 \atto3508 [\csname si@svn@version\endcsname siunitx:
 \femto3509 SI Multiple prefixes]
 \pico3510 \newprefix{\yocto}{-24}{y}
 \nano3511 \newprefix{\zepto}{-21}{z}
 \micro3512 \newprefix{\atto}{-18}{a}
 \Micro3513 \newprefix{\femto}{-15}{f}
 \Milli3514 \newprefix{\pico}{-12}{p}
 \milli3515 \newprefix{\nano}{-9}{n}
 \centi Some testing is needed for unitsdef compatibility.
 \deci
 3516 \ifsi@old@OHM
 3517 \newprefix{\Micro}{-6}{\si@sym@mu}
 3518 \else
 3519 \ifsi@gensymb\else
 3520 \newprefix{\micro}{-6}{\si@sym@mu}
 3521 \fi
 3522 \fi
 3523 \newprefix{\milli}{-3}{m}
 3524 \newprefix{\centi}{-2}{c}
 3525 \newprefix{\deci}{-1}{d}
```

\deca Now the large ones.

```
\hecto3526 \newprefix{\deca}{1}{da}
 \kilo3527 \newprefix{\hecto}{2}{h}
 \mega3528 \newprefix{\kilo}{3}{k}
 \giga3529 \newprefix{\mega}{6}{M}
 \tera3530 \newprefix{\giga}{9}{G}
 \peta3531 \newprefix{\tera}{12}{T}
 \exa3532 \newprefix{\peta}{15}{P}
 \zetta3533 \newprefix{\exa}{18}{E}
 \yotta3534 \newprefix{\zetta}{21}{Z}
 \yotta3535 \newprefix{\yotta}{24}{Y}
```

```
\deka Apparently, "deka" is common in the US for deca.
```

```
3536 \newprefix{\deka}{1}{da}
```

```
\gram As the base unit of mass is the kilogram, rather than the gram, a bit of extra work
\kilogram is needed; by default the package only defines \kilogram, but with the prefixes
available, this is altered to be \kilo\gram. For that, the \gram must be defined
first.
```

```
3537 \newunit{\gram}{g}
```

```
3538 \renewunit{\kilogram}{\kilo\gram}
```

## 22.2 Derived units with specific names

```
\becquerel Derived units with specific names and symbols are defined. Litre is an awkward
\coulomb one, but here the UK standard is used.
```

```
\farad3539 \ProvidesFile{si-named.cfg}
 [\csname si@svn@version\endcsname siunitx: SI Named units]
\gray3540 \newunit{\becquerel}{Bq}
\coulomb3541 \newunit{\coulomb}{C}
\hertz3542 \newunit{\farad}{F}
\henry3543 \newunit{\gray}{Gy}
\joule3544 \newunit{\coulomb}{Gy}
\katal3545 \newunit{\gray}{Gy}
\lumen3546 \newunit{\hertz}{Hz}
\lux3547 \newunit{\henry}{H}
\newton3548 \newunit{\joule}{J}
\newton3549 \newunit{\katal}{kat}
 3550 \newunit{\lumen}{lm}
 3551 \newunit{\lux}{lx}
 3552 \newunit{\newton}{N}
```

```
\ohm Some testing is needed for unitsdef compatibility.
```

```
\Ohm3553 \ifsi@old@OHM
\pascal3554 \newunit{\Ohm}{\si@sym@Omega}
\siemens3555 \else
\sievert3556 \ifsi@gensymb\else
\tesla To be on the safe side, use \provideunit.
\volt3557 \provideunit{\ohm}{\si@sym@Omega}
\watt3558 \fi
\weber3559 \fi
 3560 \newunit{\pascal}{Pa}
 3561 \newunit{\siemens}{S}
 3562 \newunit{\sievert}{Sv}
 3563 \newunit{\tesla}{T}
 3564 \newunit{\volt}{V}
 3565 \newunit{\watt}{W}
 3566 \newunit{\weber}{Wb}
```

```
\celsius The degree celsius is a named unit.
```

```
\Celsius3567 \ifsi@old@OHM
 3568 \newunit{\Celsius}{\si@sym@celsius}
 3569 \else
 3570 \ifsi@gensymb\else
 3571 \newunit{\celsius}{\si@sym@celsius}
```

```
3572 \fi
3573 \fi
```

\radian The radian and steradian are officially derived units.

```
\steradian3574 \newunit{\radian}{rad}
3575 \newunit{\steradian}{sr}
```

## 22.3 Units with prefixes

As in `unitsdef`, some commonly used prefixed units are set up. This requires `si-prefix.cfg` and `si-named.cfg`.

```
3576 \ProvidesFile{si-prefix.cfg}
3577 [\csname si@svn@version\endcsname siunitx:
3578 SI Prefixed units]
3579 \requiresiconfigs{prefix,named,accepted,physical}
```

\picometre Extra distances.

```
\nanometre3580 \newunit{\picometre}{\pico\metre}
\micrometre3581 \newunit{\nanometre}{\nano\metre}
\millimetre3582 \newunit{\micrometre}{\micro\metre}
\centimetre3583 \newunit{\millimetre}{\milli\metre}
\decimetre3584 \newunit{\centimetre}{\centi\metre}
\kilometre3585 \newunit{\decimetre}{\deci\metre}
3586 \newunit{\kilometre}{\kilo\metre}
```

\femtogram Extra masses.

```
\picogram3587 \newunit{\femtogram}{\femto\gram}
\nanogram3588 \newunit{\picogram}{\pico\gram}
\microgram3589 \newunit{\nanogram}{\nano\gram}
\milligram3590 \newunit{\microgram}{\micro\gram}
3591 \newunit{\milligram}{\milli\gram}
```

\femtomole Now some moles.

```
\picomole3592 \newunit{\femtomole}{\femto\mole}
\nanomole3593 \newunit{\picomole}{\pico\mole}
\micromole3594 \newunit{\nanomole}{\nano\mole}
\millimole3595 \newunit{\micromole}{\micro\mole}
3596 \newunit{\millimole}{\milli\mole}
```

\attosecond Prefixed seconds.

```
\femtosecond3597 \newunit{\attosecond}{\atto\second}
\picosecond3598 \newunit{\femtosecond}{\femto\second}
\nanosecond3599 \newunit{\picosecond}{\pico\second}
\microsecond3600 \newunit{\nanosecond}{\nano\second}
\millisecond3601 \newunit{\microsecond}{\micro\second}
3602 \newunit{\millisecond}{\milli\second}
```

\picoampere The last prefixed base units are amperes.

```
\nanoampere3603 \newunit{\picoampere}{\pico\ampere}
\microampere3604 \newunit{\nanoampere}{\nano\ampere}
\milliampere3605 \newunit{\microampere}{\micro\ampere}
\kiloampere3606 \newunit{\milliampere}{\milli\ampere}
3607 \newunit{\kiloampere}{\kilo\ampere}
```

```

\millivolt More electricity-related units.

\kilovolt3608 \newunit{\millivolt}{\milli\volt}
\milliwatt3609 \newunit{\kilovolt}{\kilo\volt}
\kilowatt3610 \newunit{\milliwatt}{\milli\watt}
\megawatt3611 \newunit{\kilowatt}{\kilo\watt}
\femtofarad3612 \newunit{\megawatt}{\mega\watt}
\picofarad3613 \newunit{\femtofarad}{\femto\farad}
\nanofarad3614 \newunit{\picofarad}{\pico\farad}
\microfarad3615 \newunit{\nanofarad}{\nano\farad}
\millifarad3616 \newunit{\microfarad}{\micro\farad}
\millisiemens3617 \newunit{\millifarad}{\milli\farad}
\millisiemens3618 \newunit{\millisiemens}{\milli\siemens}

\kiloohm For resistance, checks are needed again for the definition of \ohm.

\megaohm3619 \ifsi@old@OHM
\gigaohm3620 \newunit{\kiloohm}{\kilo\Ohm}
3621 \newunit{\megaohm}{\mega\Ohm}
3622 \newunit{\gigaohm}{\giga\Ohm}
3623 \else
3624 \ifsi@gensymb\else
3625 \newunit{\kiloohm}{\kilo\ohm}
3626 \newunit{\megaohm}{\mega\ohm}
3627 \newunit{\gigaohm}{\giga\ohm}
3628 \fi
3629 \fi

\microlitre Volumes (unlike unitsdef, with litre and metre spelled correctly). \millilitre
\millilitre and \microlitre are defined as they are the two officially-sanctioned prefixes
\cubicmetre for the litre.

\cubiccentimetre3630 \newunit{\microlitre}{\micro\litre}
\centimetrecubed3631 \newunit{\millilitre}{\milli\litre}
\cubicmicrometre3632 \newunit{\cubicmetre}{\metre\cubed}
\cubicmillimetre3633 \newunit{\cubiccentimetre}{\centi\metre\cubed}
\cubicdecimetre3634 \newunit{\centimetrecubed}{\centi\metre\cubed}
3635 \newunit{\cubicmicrometre}{\micro\metre\cubed}
3636 \newunit{\cubicmillimetre}{\milli\metre\cubed}
3637 \newunit{\cubicdecimetre}{\cubic\decimetre}

\squaremetre Areas, with metre spelled corrected; \are and \hectare are in the “temporarily
\squarecentimetre accepted” file.

\centimetresquared3638 \newunit{\squaremetre}{\Square\metre}
\squarekilometre3639 \newunit{\squarecentimetre}{\Square\centi\metre}
3640 \newunit{\centimetresquared}{\centi\metre\squared}
3641 \newunit{\squarekilometre}{\Square\kilo\metre}

\millijoule Some energy is needed by now! Notice the definition of \kilowatthour
\kilojoule3642 \newunit{\millijoule}{\milli\joule}
\megajoule3643 \newunit{\kilojoule}{\kilo\joule}
\millielectronvolt3644 \newunit{\megajoule}{\mega\joule}
\kilolectronvolt3645 \newunit{\millielectronvolt}{\milli\electronvolt}
\megaelectronvolt3646 \newunit{\kiloelectronvolt}{\kilo\electronvolt}
\gigaelectronvolt3647 \newunit{\megaelectronvolt}{\mega\electronvolt}
\teraelectronvolt3648 \newunit{\gigaelectronvolt}{\giga\electronvolt}
\kilowatthour

```

```

3649 \newunit{\teraelectronvolt}{\tera\electronvolt}
3650 \newunit[unitsep=none]{\kilowatthour}{\kilo\watt\hour}

\millihertz Frequencies.
\kilohertz3651 \newunit{\millihertz}{\milli\hertz}
\megahertz3652 \newunit{\kilohertz}{\kilo\hertz}
\gigahertz3653 \newunit{\megahertz}{\mega\hertz}
\terahertz3654 \newunit{\gigahertz}{\giga\hertz}
3655 \newunit{\terahertz}{\tera\hertz}

\millinewton A few more from various areas.
\kilonewton3656 \newunit{\millinewton}{\milli\newton}
\hectopascal3657 \newunit{\kilonewton}{\kilo\newton}
\megabecquerel3658 \newunit{\hectopascal}{\hecto\pascal}
\millisievert3659 \newunit{\megabecquerel}{\mega\becquerel}
3660 \newunit{\millisievert}{\milli\sievert}

```

## 22.4 Abbreviated units

\pA The abbreviated units are sorted in one file. To allow back-compatibility with  
 \nA unitsdef, each one is inside an \if block for the appropriate option. First currents.

```

\micA3661 \ProvidesFile{si-abbr.cfg}
\mA3662 [\csname si@svn@version\endcsname siunitx: Abbreviated units]
\kA3663 \requiresiconfigs{prefix,named,accepted,physical}
3664 \newunit{\pA}{\pico\ampere}
3665 \newunit{\nA}{\nano\ampere}
3666 \newunit{\micA}{\micro\ampere}
3667 \newunit{\mA}{\milli\ampere}
3668 \newunit{\kA}{\kilo\ampere}

```

\Hz Then frequencies.

```

\mHz3669 \newunit{\Hz}{\hertz}
\kHz3670 \newunit{\MHz}{\milli\hertz}
\MHz3671 \newunit{\kHz}{\kilo\hertz}
\GHz3672 \newunit{\MHz}{\mega\hertz}
\THz3673 \newunit{\GHz}{\giga\hertz}
3674 \newunit{\THz}{\tera\hertz}

```

\fmol Amounts of substance.

```

\pmol3675 \newunit{\fmol}{\femto\mole}
\nmol3676 \newunit{\pmol}{\pico\mole}
\micmol3677 \newunit{\nmol}{\nano\mole}
\mmol3678 \newunit{\micmol}{\micro\mole}
3679 \newunit{\mmol}{\milli\mole}

```

\kV Potentials.

```

\mV3680 \newunit{\kV}{\kilo\volt}
3681 \newunit{\mV}{\milli\volt}

```

\ml Volumes and areas

```

\micl3682 \provideunit{\ml}{\milli\litre}
\cmc3683 \provideunit{\micl}{\micro\litre}
\dmcl
\cms

```

```

3684 \newunit{\cmc}{\centi\metre\cubed}
3685 \newunit{\dmc}{\deci\metre\cubed}
3686 \newunit{\cms}{\centi\metre\squared}

\kg Masses.
\fg3687 \newunit{\kg}{\kilo\gram}
\pg There is a name clash with babel here in French; hopefully there will not be too
\nanog many complaints.
\micg3688 \provideunit{\fg}{\femto\gram}
\mg3689 \newunit{\pg}{\pico\gram}
\amu3690 \newunit{\nanog}{\nano\gram}
\sub{3691} \newunit{\micg}{\micro\gram}
\sub{3692} \newunit{\mg}{\milli\gram}
\sub{3693} \newunit{\amu}{\atomicmass}

\kJ Energies.
\ev3694 \newunit{\kJ}{\kilo\joule}
\meV3695 \newunit{\eV}{\electronvolt}
\keV3696 \newunit{\meV}{\milli\electronvolt}
\MeV3697 \newunit{\keV}{\kilo\electronvolt}
\GeV3698 \newunit{\MeV}{\mega\electronvolt}
\TeV3699 \newunit{\GeV}{\giga\electronvolt}
\kWh3700 \newunit{\TeV}{\tera\electronvolt}
\kWh3701 \newunit[unitsep=none]{\kWh}{\kilo\watt\hour}

\picom Lengths.
\nm3702 \newunit{\picom}{\pico\metre}
\micm3703 \newunit{\nm}{\nano\metre}
\mm3704 \newunit{\micm}{\micro\metre}
\cm3705 \newunit{\mm}{\milli\metre}
\dm3706 \newunit{\cm}{\centi\metre}
\km3707 \newunit{\dm}{\deci\metre}
\sub{3708} \newunit{\km}{\kilo\metre}

\Sec Finally, times.
\as3709 \newunit{\Sec}{\second}
\fs3710 \newunit{\as}{\atto\second}
\ps3711 \newunit{\fs}{\femto\second}
\ns The letter class (and others) define \ps for postscripts, so \provideunit is best
\mics here.
\ms3712 \provideunit{\ps}{\pico\second}
\sub{3713} \newunit{\ns}{\nano\second}
\sub{3714} \newunit{\mics}{\micro\second}
\sub{3715} \newunit{\ms}{\milli\second}

```

## 22.5 Additional (temporary) SI units

\angstrom Some units are “temporarily” acceptable for use in the SI system. These are  
\are defined here, although some are in very general use.

```

\hectare3716 \ProvidesFile{si-addn.cfg}
\barn3717 [\csname si@svn@version\endcsname siunitx:
\BAR
\bbar
\millibar
\gal
\curie
\roentgen
\rad
\rem

```

```

3718 SI Additional units]
3719 \newunit{\angstrom}{\si@sym@ringA}
3720 \newunit{\are}{a}
3721 \newunit{\hectare}{\hecto\are}
3722 \newunit{\barn}{b}
3723 \newunit{\BAR}{bar}
3724 \newunit{\bbar}{bar}
3725 \newunit{\millibar}{\milli\BAR}
3726 \newunit{\gal}{Gal}
3727 \newunit{\curie}{Ci}
3728 \newunit{\roentgen}{R}
3729 \newunit{\rad}{rad}
3730 \newunit{\rem}{rem}

```

## 22.6 Units accepted for use with SI

The units which are accepted but do not fit in the above, plus \percent which seems to fit into this category.

```

\minute
\hour3731 \ProvidesFile{si-accepted.cfg}
\Day3732 [\csname si@svn@version\endcsname siunitx: SI Accepted units]
\dday3733 \newunit{\minute}{min}
\degree3734 \newunit{\hour}{h}
\Degree3735 \newunit{\Day}{d}
\arcmin3736 \newunit{\dday}{d}
\arcsec3737 \ifsi@old@OHM
\arcsec3738 \newunit[valuesep=none]{\Degree}{\si@sym@degree}
\litre3739 \else
\liter3740 \ifsi@gensymb\else
\tonne3741 \newunit[valuesep=none]{\degree}{\si@sym@degree}
\neper3742 \fi
\bel3743 \fi
\percent3744 \newunit[valuesep=none]{\arcmin}{\si@sym@minute}
\percent3745 \newunit[valuesep=none]{\arcsec}{\si@sym@second}
\percent3746 \newunit{\litre}{l}
\percent3747 \newunit{\liter}{L}
\percent3748 \newunit{\tonne}{t}
\percent3749 \newunit{\neper}{Np}
\percent3750 \newunit{\bel}{B}
\percent3751 \newunit{\percent}{\%}

```

## 22.7 Units based on physical measurements

\si@eVspacea A few units based on physical measurements exist. For \eV, the need for a \si@eVspaceb negative kern does make things a bit complicated.

```

\electronvolt3752 \ProvidesFile{si-physical.cfg}
\atomicmassunit3753 [\csname si@svn@version\endcsname siunitx:
\atomicmass3754 SI Physically-measured units]
3755 \newcommand*{\si@eVspacea}{\text{\kern-\si@eVcorra}}%
3756 \newcommand*{\si@eVspaceb}{\text{\kern-\si@eVcorrb}}%
3757 \newunit{\electronvolt}{\e\protect\si@eVspacea V\protect\si@eVspaceb}
3758 \si@eVspaceb

```

```
3759 \newunit{\atomicmass}{u}
3760 \newunit{\atomicmassunit}{u}
```

## 23 Additional configurations

To provide flexibility for people in specific areas, specialised units can be set up. These are then stored separately to ease use.

### 23.1 Synthetic chemistry

\mmHg Some useful units for synthetic chemists; although \mmHg and \Molar are outside of the SI system, they are used a lot. These are set up using \provideunit as people may have their own definitions.

```
\torr3761 \ProvidesFile{si-synchem.cfg}
\dalton3762 [\csname si@svn@version\endcsname siunitx: Units for
3763 synthetic chemists]
3764 \requiresiconfigs{prefix}
3765 \newunit{\mmHg}{mmHg}
3766 \newunit{\molar}{\mole\per\cubic\deci\metre}
3767 \newunit{\Molar}{\textsc{m}}
3768 \newunit{\torr}{Torr}
3769 \newunit{\dalton}{Da}
```

### 23.2 High-energy physics

Some units inspired by hepunits.

```
3770 \ProvidesFile{si-hep.cfg}
3771 [\csname si@svn@version\endcsname siunitx: Units for
3772 high-energy physics]
3773 \requiresiconfigs{prefix,named}
```

\micron These specific to high-energy physics, but are not defined elsewhere in siunitx.<sup>54</sup>

```
\mrad3774 \provideunit{\micron}{\micro\metre}
\gauss3775 \newunit{\mrad}{\milli\rad}
3776 \newunit{\gauss}{G}
```

\clight The speed of light is used in units for the area, although of course it is not strictly a unit. However, this makes it easier to use in other units.

```
3777 \newunit{\clight}{\ensuremath{\mathit{c}}}
3778 \newunit{\eVperc}{\eV\per\clight}
```

\nanobarn Various prefixed barns.

```
\picobarn3779 \newunit{\nanobarn}{\nano\barn}
\femtobarn3780 \newunit{\picobarn}{\pico\barn}
\attobarn3781 \newunit{\femtobarn}{\femto\barn}
\zeptobarn3782 \newunit{\attobarn}{\atto\barn}
\yoctobarn3783 \newunit{\zeptobarn}{\zepto\barn}
3784 \newunit{\yoctobarn}{\yocto\barn}
```

---

<sup>54</sup>It is not clear from hepunits, but the assumption is that \mrad represents millirad and not milliradian.

```
\nb Abbreviations for the same, but using \provideunit to avoid any clashes.
```

```
\pb3785 \provideunit{\nb}{\nano\barn}
\fb3786 \provideunit{\pb}{\pico\barn}
\ab3787 \provideunit{\fb}{\femto\barn}
\zb3788 \provideunit{\ab}{\atto\barn}
\yb3789 \provideunit{\zb}{\zepto\barn}
3790 \provideunit{\yb}{\yocto\barn}
```

### 23.3 Astronomy

```
\parsec For astronomy, the \parsec unit is needed.
```

```
\lightyear3791 \ProvidesFile{si-astro.cfg}
3792 [\csname si@svn@version\endcsname siunitx:
3793 Units for astronomy]
3794 \newunit{\parsec}{pc}
3795 \newunit{\lightyear}{ly}
```

### 23.4 Binary units

```
\kibi The binary units, as specified by the IEC and made available by Slunits. First, the
\mebi binary prefixes.
```

```
\gibi3796 \ProvidesFile{si-binary.cfg}
\tEBI3797 [\csname si@svn@version\endcsname siunitx: Binary units]
\pebi3798 \newprefix[binary]{\kibi}{10}{Ki}
\exbi3799 \newprefix[binary]{\mebi}{20}{Mi}
\zebi3800 \newprefix[binary]{\gibi}{30}{Gi}
\yobi3801 \newprefix[binary]{\tebi}{40}{Ti}
3802 \newprefix[binary]{\pebi}{50}{Pi}
3803 \newprefix[binary]{\exbi}{60}{Ei}
3804 \newprefix[binary]{\zebi}{70}{Zi}
3805 \newprefix[binary]{\yobi}{80}{Yi}
```

```
\bit Now the units.
```

```
\byte3806 \newunit{\bit}{bit}
3807 \newunit{\byte}{B}
```

## 24 Loadable locales

Some short files to provide the correct settings for various places.

### 24.1 United Kingdom

This is identical to the USA locale, and contains the package default values.<sup>55</sup>

```
3808 \ProvidesFile{si-UK.cfg}
3809 [\csname si@svn@version\endcsname siunitx: UK locale]
3810 \sisetup{
3811 unitsep=thin,
3812 expproduct=times,
3813 valuesep=thin,
```

---

<sup>55</sup>The package author is in the UK.

```
3814 decimalsymbol=fullstop,
3815 digitsep=thin,
3816 sepfour=false}
```

## 24.2 United States

The same as for the UK.

```
3817 \ProvidesFile{si-USA.cfg}
3818 [\csname si@svn@version\endcsname siunitx: USA locale]
3819 \sisetup{
3820 unitsep=thin,
3821 expproduct=times,
3822 valuesep=thin,
3823 decimalsymbol=fullstop,
3824 digitsep=thin,
3825 sepfour=false}
```

## 24.3 Germany

Germany, hopefully.

```
3826 \ProvidesFile{si-DE.cfg}
3827 [\csname si@svn@version\endcsname siunitx: Germany locale]
3828 \sisetup{
3829 unitsep=cdot,
3830 valuesep=thin,
3831 decimalsymbol=comma,
3832 expproduct=cdot,
3833 digitsep=thin,
3834 sepfour=false}
```

## 24.4 South Africa

Design decisions taken from the same section of `Sstyle`.

```
3835 \ProvidesFile{si-ZA.cfg}
3836 [\csname si@svn@version\endcsname siunitx:
3837 South Africa locale]
3838 \sisetup{
3839 unitsep=cdot,
3840 valuesep=thin,
3841 expproduct=times,
3842 decimalsymbol=comma,
3843 digitsep=thin,
3844 sepfour=false}
```

# 25 Emulation code

Each emulation mode loads an appropriate definition file. This then alters the package defaults, and defines new macros provided by the emulated package.

## 25.1 units

The very first thing to do here is a reload check, as things could go wrong with unitsdef emulation.

```
3845 \si@ifloaded{units}{\endinput}{}{}
```

The **units** package is quite easy to emulate, as it only has a few options and macros. There is also no error checking in **units** for conflicting options, so users probably expect none.

```
3846 \ProvidesFile{si-units.cfg}
3847 [\csname si@svn@version \endcsname siunitx: Emulation of units]
3848 \si@emulating{units}{1998/08/04 v0.9b}
3849 \si@ifloaded{SIunits}
3850 {\si@emclash{units}{SIunits}\endinput}{}{}
3851 \si@ifloaded{sistyle}
3852 {\si@emclash{units}{sistyle}\endinput}{}{}
```

To emulate **units**, \per must give fractions.

```
3853 \sisetup{per=fraction,fraction=nice,obeybold,inlinebold=maths,
3854 ,obeymode}
3855 \ifsi@old@tight
3856 \sisetup{valuesep=thin}
3857 \fi
3858 \ifsi@old@loose
3859 \sisetup{valuesep=space}
3860 \fi
3861 \ifsi@old@ugly
3862 \sisetup{fraction=ugly}
3863 \fi
```

\unit The **units** version of \unit is similar to \SI. Here and in \unitfrac the \num macro is used; thus the number given really has to be a number. However, if users are using siunitx rather than units they should expect more checking of input. As the units package uses the current mode, this has to be detected.

```
\unit[<num>]{<unit>}
```

```
3864 \si@newrobustcmd*\{\unit}[2][]{%
3865 \ifmmode
3866 \SI{#1}{#2}%
3867 \else
3868 \SI[obeyfamily,obeyitalic]{#1}{#2}%
3869 \fi}
```

\unitfrac \unitfrac is a bit more of a hack.

```
\unitfrac[<num>]{<numerator>}{<denominator>}
```

```
3870 \si@newrobustcmd*\{\unitfrac}[3][]{%
3871 \begingroup
3872 \si@fam@mode%
3873 \ifmmode\else
3874 \sisetup{obeyfamily,obeyitalic}%
3875 \fi
3876 \si@ifnotmtarg{#1}
3877 {\num{#1}\ensuremath{\{\si@valuesep\}}%
3878 \si@frac{#2}{#3}
3879 \endgroup}
```

## 25.2 unitsdef

The package begins with the usual identification of what is happening. Although `si-units.cfg` makes the same checks, the error will make more sense if it comes here, in the event of a clash.

```
3880 \ProvidesFile{si-unitsdef.cfg}
3881 [\csname si@svn@version\endcsname siunitx:
3882 Emulation of unitsdef]
3883 \si@emulating{unitsdef}{2005/01/04 v0.2}
3884 \si@ifloaded{SIunits}
3885 {\si@emclash{unitsdef}{SIunits}\endinput{}}
3886 \si@ifloaded{sistyle}
3887 {\si@emclash{unitsdef}{sistyle}\endinput{}}
```

Emulation of units is needed for unitsdef to work.

```
3888 \requiresiconfigs{units}
```

The `unitsdef` package loads some packages that `siunitx` does not. In particular, it loads `textcomp` and `fontenc`. This could be important for output, and so the same is done here.

```
3889 \RequirePackage{textcomp}
3890 \RequirePackage[T1]{fontenc}
```

The multitude of package options for `unitsdef` need to be handled.

```
3891 \sisetup{mode=text,allowoptarg,prespace}
3892 \ifsi@old@noxspace
3893 \sisetup{xspace=false}
3894 \fi
```

The various options for loading unit abbreviations have to be handled. Here, any request to avoid abbreviations prevents any loading.

```
3895 \ifsi@old@noabbr
3896 \sisetup{noload=abbr}
3897 \fi
3898 \ifsi@old@nofrequencyabbr
3899 \sisetup{noload=abbr}
3900 \fi
3901 \ifsi@old@nomolabbr
3902 \sisetup{noload=abbr}
3903 \fi
3904 \ifsi@old@novoltageabbr
3905 \sisetup{noload=abbr}
3906 \fi
3907 \ifsi@old@novolumeabbr
3908 \sisetup{noload=abbr}
3909 \fi
3910 \ifsi@old@noweighthabbr
3911 \sisetup{noload=abbr}
3912 \fi
3913 \ifsi@old@noenergyabbr
3914 \sisetup{noload=abbr}
3915 \fi
3916 \ifsi@old@nolengthabbr
3917 \sisetup{noload=abbr}
3918 \fi
```

```

3919 \ifsi@old@notimeabbr
3920 \sisetup{noload=abbr}
3921 \fi

```

\unitvaluesep To emulate the \unitvaluesep macro, a hack is needed of the original `xkeyval` macro for `valuesep`, as well of course as a definition of the macro itself.

```

3922 \newcommand*\unitvaluesep{}{,}
3923 \renewcommand*\si@valuesep{\text{\unitvaluesep}}
3924 \define@choicekey*[si]{key}{valuesep}[\si@tempa]
3925 {space,thin,med,medium,thick,none}
3926 {\renewcommand*\unitvaluesep@nameuse{si@fix@##1}%
3927 \si@log@debug{Option valuesep set to ##1}%
3928 {\si@log@debug{Option valuesep set to ##1}%
3929 \renewcommand*\unitvaluesep{##1}}

```

\unitsignonly Some rather straight-forward definitions, with just a bit of fun to get the spacing `\ilu` correct.

```

\arc
3930 \let\unitsignonly\si
3931 \si@newrobustcmd*\ilu[2][]{%
3932 \begingroup
3933 #1\unitvaluesep%
3934 \unit{#2}%
3935 \endgroup
3936 \let\arc\ang

```

\unitSIdf The `unitsdef` package uses a different approach to setting the font inside its version of `\SI`. The problem is the same as for `\unitvaluesep`, but with the added problem that `siunitx` uses `\csname ... \endcsname`.

```

3937 \newcommand*\unitSIdf{\upshape}
3938 \newcommand*\si@unitSIdf{\unitSIdf\selectfont}
3939 \sisetup{textrm=si@unitSIdf}

```

\per Rather awkwardly, `unitsdef` uses `\per` in a different way to `siunitx`.

```

3940 \let\per\relax
3941 \si@newrobustcmd*\per[2]{%
3942 \begingroup
3943 \si@xspacefalse
3944 \renewcommand*\unitvaluesep{}%
3945 \unitfrac{#1}{#2}%
3946 \endgroup

```

\unittimes Some pretty straight-forward stuff again; notice that the automatic analyser for `\unitsep` units has to be turned off for this to work.

```

\unitsuperscript
3947 \newcommand*\unittimes{\ensuremath{\cdot}}
3948 \newcommand*\unitsep{}{,}
3949 \renewcommand*\si@unt@unithook{\si@unt@litouttrue}
3950 \sisetup{unitsep=none}
3951 \newcommand*\unitsuperscript{\tothe}

```

\newnosepunit Simple aliases.

```

\renewnosepunit
3952 \newcommand*\newnosepunit{\newunit[valuesep=none]}
3953 \newcommand*\renewnosepunit{\renewunit[valuesep=none]}

```

```

\setTextOmega Controlling symbols is a simple translation job; as only one setting is used by
\setMathOmega siunitx in text mode, a bit of extra work is needed.

3954 \newcommand*{\setTextOmega}[2]{%

4094 \fi

```

### 25.3 Sistyle

After setting the necessary defaults, the emulation code defines the macros in Sistyle as given in the manual for that package.

```

4095 \ProvidesFile{si-sistyle.cfg}
4096 [\csname si@svn@version\endcsname siunitx: Emulation of
4097 Sistyle]
4098 \si@emulating{sistyle}{2006/12/20 v2.3}
4099 \sisetup{%
4100 sepfour=true,
4101 obeyfamily,
4102 obeyitalic=true,
4103 numsign=+-,
4104 strictarc=false,
4105 unitsep=cdot}

```

\SIobeyboldtrue Some simple switches, but not using \newif.

```
\SIobeyboldfalse
4106 \newcommand*{\SIobeyboldtrue}{\sisetup{obeybold=true}}
4107 \newcommand*{\SIobeyboldfalse}{\sisetup{obeybold=false}}
```

\num To get the correct behaviour for \num, some redefinitions are needed to handle

\si@sis@num to optional \*.

```

\si@sis@numstar
4108 \let\num\relax
4109 \si@newrobustcmd*\num{%
4110 \@ifstar
4111 {\si@sis@numstar}
4112 {\si@sis@num}}
4113 \newcommand*{\si@sis@num}[2]{%
4114 \begingroup%
4115 \sisetup{#1}%
4116 \expandafter\si@out@num\expandafter{\si@num{#2}}%
4117 \endgroup}
4118 \newcommand*{\si@sis@numstar}[2]{%
4119 \begingroup%
4120 \sisetup{mode=text,obeybold}%
4121 \sisetup{#1}%
4122 \expandafter\si@out@num\expandafter{\si@num{#2}}%
4123 \endgroup}

```

\pnt The \pnt macro is needed as . is active inside \SI. The name is exactly the same as in `\SIstyle`, but the implementation is different. This is not defined by the main package as there are better ways of including numbers in the output than this.

```
4124 \newcommand*{\pnt}{\ensuremath{\text{\si@decimalsymbol}}}
```

\SIgroupfourtrue Switches for grouping four characters.

```
\SIgroupfourfalse4125 \newcommand*{\SIgroupfourtrue}{\sisetup{sepfour=true}}
4126 \newcommand*{\SIgroupfourfalse}{\sisetup{sepfour=false}}
```

\SIunitsep Whatever is given here is passed through to \sisetup.

```
\SIunitspace4127 \newcommand*{\SIunitsep}[1]{\sisetup{valuesep={#1}}}
\SIunitdot4128 \newcommand*{\SIunitspace}[1]{\sisetup{unitspace={#1}}}
4129 \newcommand*{\SIunitdot}[1]{\sisetup{unitsep={#1}}}
```

\SIdecimalsymbol The same is true here, with the appropriate translation.

```
\SIthousandsep4130 \newcommand*{\SIdecimalsymbol}[1]{\sisetup{decimalsymbol={#1}}}
\SIproductsign4131 \newcommand*{\SIthousandsep}[1]{\sisetup{digitsep={#1}}}
\SIdecimalsign4132 \newcommand*{\SIproductsign}[1]{\sisetup{expproduct={#1}}}
4133 \newcommand*{\SIdecimalsign}[1]{\sisetup{decimalsymbol={#1}}}
```

\si@sis@savefont The font definitions need a bit of extra work doing. As both settings here have @ as a letter, all should be fine.

```
\si@sis@savefont{\langle setting\rangle}{\langle argument\rangle}
4134 \newcommand*{\si@sis@savefont}[2]{%
4135 \namedef{\si@sis@#1}{#2}%
4136 \sisetup{#1=si@sis@#1}}
```

\SImathrm The font control macros have to ensure that a macro name is passed to \sisetup.

```
\SImathsf4137 \newcommand*{\SImathrm}[1]{\si@sis@savefont{mathrm}{#1}}
\SImathtt4138 \newcommand*{\SImathsf}[1]{\si@sis@savefont{mathsf}{#1}}
4139 \newcommand*{\SImathtt}[1]{\si@sis@savefont{mathtt}{#1}}
```

\SIdefaultMfam The same for the default keys.

```
\SIdefaultNfam4140 \newcommand*{\SIdefaultMfam}[1]{\si@sis@savefont{mathrm}{#1}}
\SIdefaultTfam4141 \newcommand*{\SIdefaultNfam}[1]{\si@sis@savefont{mathnumrm}{#1}}
4142 \newcommand*{\SIdefaultTfam}[1]{\si@sis@savefont{textrm}{#1}}
```

\ensureupmath The \ensureupmath command guarantees processing by the font-matching system. The argument cannot be processed here, so care is needed.

```
4143 \si@newrobustcmd*{\ensureupmath}[1]{%
4144 \begingroup
4145 \sisetup{mode=maths,obeyitalic=false}%
4146 \si@out{#1}%
4147 \endgroup}
```

\degC A few extra symbol names are needed.

```
\degF4148 \newcommand*{\degC}{\si@sym@celsius}
\arcdeg4149 \newcommand*{\arcdeg}{\si@sym@degree}
4150 \newcommand*{\degF}{\si@sym@degree F}
```

```

\AddToSIstyle Finally, the locale control.

\SISyle4151 \newcommand*{\SISyle}[1]{\sisetup{locale=#1}}
\SISyleToLang4152 \newcommand*{\SISyleToLang}[2]{\sisetup{loctolang=#1:#2}}
\si@sis@addtolocale4153 \newcommand*{\AddToSIstyle}{%
 4154 \si@switchfalse
 4155 \@ifstar
 4156 {\si@switchtrue
 4157 \si@sis@addtolocale}
 4158 {\si@sis@addtolocale}}
 4159 \newcommand*{\si@sis@addtolocale}[2]{%
 4160 \ifsi@switch
 4161 \expandafter\let\csname si@loc@#1@extra\endcsname\relax
 4162 \fi
 4163 \addtolocale{#1}{#2}}

```

## 25.4 Slunits

Slunits emulation starts in much the same way.

```

4164 \ProvidesFile{si-SIunits.cfg}
4165 [\csname si@svn@version\endcsname siunitx: Emulation of
4166 SIunits]
4167 \si@emulating{SIunits}{2007/12/02 v1.36}
4168 \sisetup{
4169 unitsep=thick,
4170 valuesep=thick,
4171 prefixproduct=\si@valuesep,
4172 trapambigfrac=false,
4173 stickyper}
4174 \requiresiconfigs{prefix,named,accepted,physical}

\reciprocal A few very simple translations, using the internal version of \per to allow
\rp changes of output style.
\per4175 \newcommand*{\reciprocal}{\sisetup{per=reciprocal}\si@per}

4525 {\giga\electronvolt\per\Square\clight}
4526 \newunit[per=slash,eVcorrb=0.6ex]{\TeVovercsq}
4527 {\tera\electronvolt\per\Square\clight}
```

## 25.6 **fancynum**

fancynum only does things with numbers, so there is only a little emulation and a few macros needed.

```
4528 \ProvidesFile{si-fancynum.cfg}
4529 [\csname si@svn@version\endcsname Emulation of siunitx:
4530 fancynum]
4531 \si@emulating{fancynum}{2000/08/08 0.92}
4532 \sisetup{decimalsymbol=cdot,digitsep=comma}
```

\fnum The \fnum macro is rather restricted, but this is not reproduced. Instead, it is \let as an alias to the \num macro.

```
4533 \let\fnum\num
```

\setfnumdsym The control macros are defined.

```
\setfnumgsym4534 \newcommand*{\setfnumdsym}[1]{\sisetup{decimalsymbol={#1}}}
\setfnummsym4535 \newcommand*{\setfnumgsym}[1]{\sisetup{digitsep={#1}}}
4536 \newcommand*{\setfnummsym}[1]{\sisetup{exprproduct={#1}}}
```

The various package options are now processed if necessary.

```
4537 \ifsi@old@english
4538 \sisetup{decimalsymbol=cdot,digitsep=comma}
4539 \fi
4540 \ifsi@old@french
4541 \sisetup{decimalsymbol=comma,digitsep=fullstop}
4542 \fi
4543 \ifsi@old@tight
4544 \sisetup{expproduct=tighttimes}
4545 \fi
4546 \ifsi@old@loose
4547 \sisetup{expproduct=times}
4548 \fi
4549 \ifsi@old@thinspace
4550 \sisetup{digitsep=thin}
4551 \fi
4552 \ifsi@old@commas
4553 \sisetup{digitsep=comma}
4554 \fi
4555 \ifsi@old@plain
4556 \sisetup{digitsep=none}
4557 \fi
```

## 25.7 fancyunits

The fancyunits package is not available on CTAN, but is available from its authors homepage [7]. It is similar to Slunits, and so most of the code is shared here. However, a few bits of set up occur first, and an emulation-clash test is needed.

```
4558 \ProvidesFile{si-fancyunits.cfg}
4559 [\csname si@svn@version\endcsname Emulation of siunitx:
4560 fancyunits]
4561 \si@emulating{fancyunits}{2007/02/01 v1.0.1}
4562 \si@ifloaded{SIunits}
4563 { \si@log@err{SIunits emulation loaded\MessageBreak before
4564 fancyunits emulation}{You need to load the fancyunits
4565 emualtion\MessageBreak code before that for
4566 SIunits.\MessageBreak Try emulate=fancyunits as the first
4567 option when\MessageBreak loading siunitx}}{}{}
```

\si@siu@newunithook To create the extra macros provided by fancyunits, the Slunits emulation code is changed to add the “uf” variants.

```
4568 \newcommand*{\si@siu@newunithook}[3][]{%
4569 \edef\si@tempa{%
4570 \expandafter\noexpand\csname #2per#1#3uf\endcsname}%
4571 \renewcommand*{\si@tempb}{stickyper,per=fraction,
4572 fraction=nice}%
4573 \edef\si@tempc{%
4574 \noexpand\sisetup{\si@tempb}%

4614 {\sisetup{stickyper,per=fraction,fraction=frac}%
4615 \renewcommand*{\si@frc@hook}{\displaystyle}%
4616 #3\si@per#4}%

```

With that done, the emulation modules can be loaded.

```

4617 \requiresiconfigs{SIunits,addn,astro}
4618 \sisetup{obeyall}

```

There is one `fancyunits`-specific option to handle. The other options all get sent through to the `Slunits` system.<sup>56</sup>

```

4619 \ifsi@old@spaceqspace
4620 \sisetup{valuesep=space}
4621 \fi

```

\paminute `fancyunits` provides some extra units, plus tonne spelled incorrectly (again).

```

\parsesecond
4622 \newunit{\paminute}{'}
\AstroE
4623 \newunit{\parsesecond}{''}
\oersted
4624 \newunit{\AstroE}{AE}

```

---

<sup>56</sup>As `Slunits` is rather more widely known than `fancyunits`, any other options which could be for either are assumed to be for `Slunits`.

```

4625 \newunit{\oersted}{OE}
4626 \provideunit{\ton}{t}

\decaD An additional prefix.
4627 \let\decaD\decad

\ufrac The fractional unit macros need to be reproduced.
\Ufrac4628 \newcommand*\ufrac[2]{%
\Ufrac4629 \si[stickyper,per=fraction,fraction=nice]{#1\si@per#2}}
4630 \newcommand*\Ufrac[2]{%
4631 \ensuremath{\textstyle{%
4632 \si[stickyper,per=fraction,fraction=frac]{#1\si@per#2}}}}}
4633 \newcommand*\Ufrac[2]{%
4634 \ensuremath{\displaystyle{%
4635 \si[stickyper,per=fraction,fraction=frac]{#1\si@per#2}}}}}

```

\pow A slightly-shorted named \power.

```
4636 \let\pow\power
```

\Squaremetre An alias for \squaremetre.

```
4637 \let\Squaremetre\squaremetre
```

As with **Slunits**, there is now a list of compound units to add. Only a few are not covered by the **Slunits** emulation.

```

4638 \si@siu@newunit{Gray}{second}
4639 \si@siu@newunit[square]{Squaremetre}{metre}
4640 \si@siu@newunitx{Squaremetre}{newtonsecond}{\Square\metre}
4641 {\newton\second}
4642 \si@siu@newunit{Squaremetre}{second}
4643 \si@siu@newunit[square]{Squaremetre}{squaresecond}
4644 \si@siu@newunit{Squaremetre}{kilogram}
4645 \si@siu@newunit[cubic]{Squaremetre}{second}

```
