

The **spath3** package

v1.1 from 2016/02/19

1 Introduction

The **spath3** package is intended as a library for manipulating PGF's *soft paths*. In between defining a path and using it, PGF stores a path as a *soft path* where all the defining structure has been resolved into the basic operations but these have not yet been written to the output file. They can therefore still be manipulated by **TEX**, and as they have a very rigid form (and limited vocabulary), they are relatively easy to modify. This package provides some methods for working with these paths. It is not really intended for use by end users but as a foundation on which other packages can be built. As examples, the **calligraphy** package and the **knot** package are included. The first of these simulates a calligraphic pen stroking a path. The second can be used to draw knot (and similar) diagrams.

The format of a soft path is a sequence of triples of the form `\macro {dimension}{dimension}`. The macro is one of a short list, the dimensions are coordinates in points. There are certain further restrictions, particularly that every path must begin with a `move to`, and Bézier curves consist of three triples.

2 Implementation

2.1 Initialisation

Load the **LATEX3** foundation and register us as a **LATEX3** package.

```
1 \NeedsTeXFormat{LaTeX2e}
2 \RequirePackage{expl3}
3 \RequirePackage{pgf}
4 \ProvidesExplPackage {spath3} {2016/02/19} {1.1} {Functions for
5 manipulating PGF soft paths}
6 \RequirePackage{xparse}
```

We need a slew of temporary variables.

```
7 \tl_new:N \l__spath_tmpa_tl
8 \tl_new:N \l__spath_tmpb_tl
9 \tl_new:N \l__spath_tmfc_tl
10 \tl_new:N \l__spath_tmfd_tl
```

```

11 \tl_new:N \l__spath_smuggle_tl
12 \dim_new:N \l__spath_tmpa_dim
13 \dim_new:N \l__spath_tmpb_dim
14 \fp_new:N \l__spath_tmpa_fp
15 \fp_new:N \l__spath_tmpb_fp
16 \int_new:N \l__spath_tmpa_int

```

We need to be able to compare against the macros that can occur in a soft path so these token lists contain them.

```

```

2.2 Basic Structure and Methods

A soft path is a *prop*. These are lists of the attributes that we define. The first consists of all attributes, the second of those that are “moveable” in the sense that they change if we transform the path, the third are the ones that contain actual paths.

Note that if using these attributes outside an `expl3` context, the spaces should be omitted.

```

29 \tl_new:N \g__spath_attributes
30 \tl_new:N \g__spath_moveable_attributes
31 \tl_new:N \g__spath_path_attributes
32 \tl_set:Nn \g__spath_attributes {
33   {path}
34   {reverse path}
35   {length}
36   {real length}
37   {number of components}
38   {initial point}
39   {final point}
40   {initial action}
41   {final action}
42   {min bb}
43   {max bb}
44 }
45 \tl_set:Nn \g__spath_moveable_attributes {
46   {initial point}
47   {final point}
48   {min bb}

```

```

49   {max bb}
50 }
51 \tl_set:Nn \g__spath_path_attributes {
52   {path}
53   {reverse path}
54 }

```

An `spath` object is actually a `prop`. The following functions are wrappers around the underlying `prop` functions. We prefix the names to avoid clashing with other `props` that might be lying around, this is why all the `spath` methods take argument `:n` and not `:N`. Given that `spath` objects might be created inside a group but used outside it, we work globally throughout.

```
\spath_new:n

(End definition for `\spath_tikz_path:nn`. This function is documented on page ??.)

2.3 Computing Information

`\spath_get:nn`

The information that we store along with a soft path can be computed from it, but computing it every time is wasteful. So this is the real `\spath_get:nn` function which checks to see if we have already computed it and then either retrieves it or computes it.

```

167 \cs_new_nopar:Npn \spath_get:nn #1#2
168 {
169   \spath_if_in:nnF {#1} {#2}
170   {

```

```

171     \cs_if_exist_use:cT {spath_generate_#2:n} {{#1}}
172   }
173   \__spath_get:nn {#1} {#2}
174 }
```

(End definition for `\spath_get:nn`. This function is documented on page ??.)

`\spath_get:nnN` As above but leaves the result in a token list rather than in the stream.

```

175 \cs_new_nopar:Npn \spath_get:nnN #1#2#3
176 {
177   \spath_if_in:nnF {#1} {#2}
178   {
179     \cs_if_exist_use:cT {spath_generate_#2:n} {{#1}}
180   }
181   \__spath_get:nnN {#1} {#2} #3
182 }
183 \cs_generate_variant:Nn \spath_get:nnN {nnV,VnN,VnV}
```

(End definition for `\spath_get:nnN`. This function is documented on page ??.)

The next slew of functions generate data from the original path, storing it in the `prop` for further retrieval.

`\spath_generate_length:n` Counts the number of triples in the path.

```

184 \cs_new_nopar:Npn \spath_generate_length:n #1
185 {
186   \__spath_get:nnN {#1} {path} \l__spath_tmpa_tl
187   \spath_put:nnx {#1} {length} {\int_eval:n {\tl_count:N \l__spath_tmpa_tl /3 }}
```

(End definition for `\spath_generate_length:n`. This function is documented on page ??.)

`\spath_generate_reallength:n` The real length of a path is the number of triples that actually draw something (that is, the number of lines and curves).

```

189 \cs_new_nopar:Npn \spath_generate_reallength:n #1
190 {
191   \__spath_get:nnN {#1} {path} \l__spath_tmpa_tl
192   \int_set:Nn \l__spath_tmpa_int {0}
193   \tl_map_inline:Nn \l__spath_tmpa_tl {
194     \tl_if_eq:nnT {##1} {\pgfsyssoftpath@linetotoken}
195     {
196       \int_incr:N \l__spath_tmpa_int
197     }
198     \tl_if_eq:nnT {##1} {\pgfsyssoftpath@curvetotoken}
199     {
200       \int_incr:N \l__spath_tmpa_int
201     }
202   }
203   \spath_put:nnx {#1} {real length} {\int_use:N \l__spath_tmpa_int}
```

(End definition for `\spath_generate_reallength:n`. This function is documented on page ??.)

\spath_generate_numberofcomponents:n A component is a continuous segment of the path, separated by moves. Successive moves are not collapsed, and zero length moves count.

```

205 \cs_new_nopar:Npn \spath_generate_numberofcomponents:n #1
206 {
207   __spath_get:nnN {#1} {path} \l__spath_tmpa_tl
208   \int_set:Nn \l__spath_tmpa_int {0}
209   \tl_map_inline:Nn \l__spath_tmpa_tl {
210     \tl_if_eq:nnT {##1} {\pgfcssoftpath@movetotoken}
211     {
212       \int_incr:N \l__spath_tmpa_int
213     }
214   }
215   \spath_put:nnx {#1} {number of components} {\int_use:N \l__spath_tmpa_int}
216 }
```

(End definition for \spath_generate_numberofcomponents:n. This function is documented on page ??.)

\spath_generate_initialpoint:n The starting point of the path.

```

217 \cs_new_nopar:Npn \spath_generate_initialpoint:n #1
218 {
219   __spath_get:nnN {#1} {path} \l__spath_tmpa_tl

226 }
```

(End definition for \spath_generate_initialpoint:n. This function is documented on page ??.)

\spath_generate_finalpoint:n The final point of the path.

```

227 \cs_new_nopar:Npn \spath_generate_finalpoint:n #1
228 {

2.6 Public Commands

The next functions are more “public” than the previous lot. That said, they aren’t intended for direct use in a normal document.

Most are just wrappers around internal functions.

\MakeSPath Constructs an `spath` object out of the given name and path.
