

The packages **svg** and **svg-extract**

Philip Ilten (2012–2016)

Falk Hanisch (2017–)

<https://github.com/mrpiggi/svg>

hanisch.latex@outlook.com

v2.02g (2020/06/12)

The **svg** package is intended for the automated integration of SVG graphics into L^AT_EX documents. Therefor the capabilities provided by *Inkscape*—or more precisely its command line interface—are used to export the text within a SVG graphic to a separate file, which is then rendered by L^AT_EX. The two commands `\includesvg` and `\includeinkscape` are provided as central user-interface, which are very similar to the `\includegraphics` command of the **graphicx** package.

In addition, the package **svg-extract** allows the extraction of these graphics into independent files in different graphic formats, exactly as it is rendered within the L^AT_EX document. For the creation of these graphics in the well-known formats PDF, EPS and PS, L^AT_EX and possibly conversion tools shipped with the distribution are used. If the graphics are required in other file formats, either *ImageMagick* or *Ghostscript* can be invoked.

The command line interface (CLI) of *Inkscape* 1.0 has changed in comparison to previous versions. In order to provide a comfortable user-interface for invoking *Inkscape*, the used version is detected and if necessary switch to the outdated syntax of the CLI. If this approach fails for some reason, you can set the version of *Inkscape* manually with `inkscapeversion=0` or `inkscapeversion=1`.

Part I.

User documentation

1. Introduction

The open source program **Inkscape** has provided an excellent resource for the simple and easy creation of images and diagrams using a graphical user-interface. The work by Johan B. C. Engelen has further enhanced the ability of **Inkscape** to split a SVG file into a text component that can be compiled with L^AT_EX, and an image component that can be imported as a PDF file. For further information see the documentation of **svg-inkscape** on CTAN¹. The procedure described therein is taken up and consistently expanded. Thus,

¹<http://www.ctan.org/pkg/svg-inkscape>

it is now possible to include a SVG file into a L^AT_EX document where the text within the SVG graphic will be rendered natively by L^AT_EX.

Both packages **svg** and **svg-extract** rely heavily upon executing commands on shell using the **\ShellEscape** command—or respectively the old known **\write18**—for executing the CLIs of the applications mentioned above. So passing flag **--shell-escape** to the L^AT_EX engine is utterly essential when using package **svg** and/or **svg-extract**. The executed commands and the possibilities to adapt their invocation with the appropriate options are described later on in this documentation. All this is done automatically with the **\includesvg** command. If you don't want to use the **--shell-escape** flag, either for security reasons or because the export of the SVG files is done in another way, there's also the command **\includeinkscape** which includes files already exported by **Inkscape**.

An working installation of **Inkscape** is required for the automated integration of SVG graphics, whereby the installation path must be known to the operating system. This can be checked on shell by typing **inkscape -V**. Moreover, there are some required packages which are loaded by packages **svg** and **svg-extract** to provide the functionallity. These are:

iftex for flow control depending on the used L^AT_EX engine
scrbase for the definition and handling of options in key-value-syntax
pdftexcmds, **shellesc** to allocate the same primitives independent of the used L^AT_EX engine
ifplatform to control the file access depending on the operating system
trimspaces to remove unwanted spaces in file paths
graphicx for including the graphic files after the **Inkscape** export
xcolor, **transparent** are possibly needed by the separate L^AT_EX files created by **Inkscape**
xr is used by **svg-extract** in order to include labels within the independent graphic files

If you want to pass options to package **graphicx**, you must either load it before package **svg**

```
\usepackage[<options>]{graphicx}
...
\usepackage[<options>]{svg}
```

or use **\PassOptionsToPackage**.

```
\PassOptionsToPackage{<options>}{graphicx}
...
\documentclass[<options>]{<class>}
...
\usepackage[<options>]{svg}
```

The usage of packages **xcolor** and **transparent** can be switched off while loading package **svg**. See the two options **usexcolor** and **usetransparent** below.

2. Usage of package **svg**

The purpose of this package is to include standalone SVG graphics into a L^AT_EX document. The command **\includesvg** is defined which does all necessary steps for this task. It first launches the export of a SVG file to a supported file format with Inkscape, if necessary, and includes the exported graphic file afterwards. The usage and the syntax is quite similiar to the command **\includegraphics** from the **graphicx** package. In fact, the inclusion of the exported graphic file is done with **\includegraphics**.

usexcolor (opt.)
usetransparent (opt.)
 noxcolor (opt.)
 notransparent (opt.)

The packages **xcolor** and **transparent** are loaded by default at the end of package **svg**. The listed options are intended to prevent these packages from loading. They are the only options which have to be given while loading the **svg** package. All supported boolean values (**true/on/yes/false/off/no**) can be assinged to **usexcolor** and **usetransparent**, while **noxcolor** and **notransparent** don't accept any value.

```
\usepackage[<options>]{svg}
```

2.1. General settings

`\svgsetup` All other options described in detail below can also be changed after loading the package either in the preamble or within the document. They don't have to be given as optional argument to `\usepackage[options]{svg}` but can be set by using macro `\svgsetup{options}` where *options* is a comma separated list of options. Settings with `\svgsetup` are done in the current scope which means globally or within the current group.

```
\svgsetup{options}
```

Further, with the optional argument of commands `\includesvg[options]{svg filename}` or `\includeinkscape[options]{graphic filename}`, it's possible to reset any setting locally for a certain file.

`\svgpath` Most likely you want to organize your SVG files in a separate folder either as a subfolder in the working directory or elsewhere in your local folder structure. For this purpose, a list of root paths to SVG files can be specified using the `\svgpath` command in the same way as `\graphicspath` is used. Every path has to be given in a group of braces {}—even if there is only one—and should terminate with a slash. For example:

```
\svgpath{{svg}/{/usr/local/svg/}}
```

would cause the system to look first in the subdirectory `svg/` and afterwards in the absolute path `/usr/local/svg/`. Further, if no path was specified with `\svgpath` or the desired file wasn't found, all directories given with `\graphicspath` are searched too. Please keep in mind that the current working directory is browsed first in any case. It is recommended to avoid umlauts or any other Non-ASCII characters as well as any spaces and/or quotes respectively `\dq` both in paths and file names. Especially when DVI output is active using quotes will certainly cause an error.

2.2. Options for the invocation of *Inkscape*

`inkscape` (opt.) This option controls, when the export with **Inkscape** is invoked and is *true* by default.
`false/off/no`
Inkscape won't be invoked in any case, no export is done.
`true/on/yes/newer/onlynewer`
The export with **Inkscape** will only be done, if the exported graphic file either does not exist or the file modification date of the SVG file is newer than that of the exported graphic file. Thus the compilation time of the L^AT_EX document can be reduced to the necessary minimum.
`forced/force/overwrite`
The **Inkscape** export will definitely be done, any already existing exported file will overwritten regardlessly.

In addition to controlling the export behavior, the option `inkscape` can also be used to make additional settings, which then acts as a wrapper for the options described below.

`pdf/eps/ps/png`
see `inkscapeformat=pdf/eps/ps/png`
`latex/nolatex`
see `inkscape latex=true/false`
`drawing/page`
see `inkscape area=drawing/page`
`<integer>dpi`
see `inkscape dpi=<integer>`

`inkscapepath` (opt.) The option `inkscapepath` specifies, where the resulting files of the **Inkscape** export should be located. The default setting is `basesubdir`, which uses the subfolder `./svg-inkscape/` within the current working directory.

svgdir/svgpath

The PDF/EPS/PS/PNG graphic files as well as the L^AT_EX files generated by **Inkscape** will be located in the same directory as the corresponding SVG file.

svgsubdir/svgsubpath

Within the folder of the encountered SVG file, all exported files will be located in a subfolder named `svg-inkscape/`.

basedir/basepath/jobdir/jobpath

All exported files will be located in the current working directory.

basesubdir/basesubpath/jobsubdir/jobsdirname

A subfolder named `svg-inkscape/` within the current working directory will be used for files generated by **Inkscape**.

/path/to/somewhere/

It is also possible to give a custom path, either relative to the current working directory (`./relative/path/`) or as an absolute path.

inkscapeexe (opt.) For including a SVG file, **Inkscape** is used to separate the text and image from the SVG file itself. In order to use the command line interface on shell, the path where the executable is located has to be known to the operating system and its name is assumed to be `inkscape` by default.

You can check if the default setting is valid for your system by typing `inkscape -V` into the terminal. If this fails and nothing is returned, you should add the binary directory of **Inkscape** to the environment variable PATH on your operating system. If this is not possible or you aren't willing to do so, you can alternatively use option `inkscapeexe` *within the document preamble* to set the absolute path where the executable of **Inkscape** is located.

inkscapeversion (opt.) The command line interface of **Inkscape** changed slightly from version 0.9x to 1.x and makes it necessary to distinguish between the two versions. By default, `inkscapeversion=auto` is set and the used version is automatically detected. This is done by calling **Inkscape-CLI** with parameter `-V` on shell—see option `inkscapeexe` described above. The returned result is evaluated by either piping `stdout` or eventually—if this fails—writing to a temporary file and read this back in (pipes with a potentially quoted path can not be used with MiK^TE_X).² It is also possible to switch off the automatic detection routine by setting the desired version manually with either `inkscapeversion=0` to legacy mode or `inkscapeversion=1` to the current CLI version.

inkscapename (opt.) The file names of the **Inkscape** export are derived from the name of the base SVG file by default. Nevertheless, the name of the exported file can be customized with `inkscapename=<filename>`. It is possible to use counters for specifying the name of the exported file. Repeatedly specifying the same file name will overwrite previously created files.

inkscapeformat (opt.) With this option, the **Inkscape** export format can be controlled. Valid values are `pdf`, `eps`, `ps` and `png`, where a L^AT_EX export is not possible for `png` and option `inkscapelatex` won't have any effect. By default, `inkscapeformat=pdf` is set unless DVI output was detected. In this case `inkscapeformat=eps` is the default setting.

inkscapelatex (opt.) If option `inkscapelatex=true` is set, the output is split into a separate PDF/EPS/PS file (see option `inkscapeformat`) and a corresponding L^AT_EX file. This is the default setting. Setting `inkscapelatex=false` will result in a single PDF/EPS/PS file, where any contained text won't be rendered by L^AT_EX.

inkscapearea (opt.) This option controls which area of the SVG file should be exported, `drawing` is set by default.

drawing / crop

The area exported corresponds to the bounding box of all objects in a drawing, including any that are not on the page.

page/nocrop

The area exported will correspond to the defined page area within the SVG file.

²If this fails too, the **Inkscape** version is guessed when macro `\svg@ink@run` is used the very first time.

<code>inkscapedpi</code> (opt.)	The resolution used either for PNG export or for fallback rasterization of filtered objects when exporting to PDF/EPS/PS file. For PNG export it is set to 300 dpi by default, if no value was given. The given value should be a positive integer. The default behaviour can be reversed after a given value with <code>inkscapedpi=\relax</code> .
<code>inkscapeopt</code> (opt.)	You can use this option to pass additional switches to the Inkscape command line interface. For further information see the documentation of Inkscape ³ .
<code>svgextension</code> (opt.)	The package assumes SVG files with <code>.svg</code> extension as source for the Inkscape export. This option can be used to change this behaviour. For example, in order to process <code>.dia</code> files instead of <code>.svg</code> you could use

```
\includesvg[svgextension=dia,<additional options>]{<filename>}
```

2.3. Options for the graphic inclusion

<code>width</code> (opt.)	The width of the included graphic file can be specified via the <code>width</code> option and the height by the <code>height</code> option. If both the width and height are specified, the figure will be scaled such that neither of the specified dimensions is exceeded, unless option <code>distort=true</code> is given. ⁴ If <code>width</code> and/or <code>height</code> once have been set, this can be undone by setting them to <code>0pt</code> or <code>\relax</code> . If neither <code>width</code> nor <code>height</code> are set, the included graphic file can also be scaled by setting <code>scale</code> to a positive real number.
---------------------------	---

<code>pretex</code> (opt.)	Commands prior and post to the inclusion of the graphic file may be desired, such as font or color commands. The options <code>pretex</code> and <code>apptex</code> are provided where the L ^A T _E X code given to <code>pretex</code> is included before the graphic file and <code>apptex</code> right afterwards. For example, to change the size of the included text one could use:
----------------------------	---

```
\includesvg[pretex=\tiny,<additional options>]{<svg filename>}
```

<code>draft</code> (opt.)	This option can be used with boolean values and is equal to the identically named option of the graphicx package. If the <code>draft</code> option is given to graphicx , it's activated for svg as well.
<code>lastpage</code> (opt.)	A bug ⁵ concerning the L ^A T _E X export has been reported for Inkscape 0.91. It may happen that within the exported L ^A T _E X file, it's attempted to include more pages of the PDF graphics than actually exist. The svg package attempts to bypass the resulting error.

Consequently, the total number of pages is read and only existing PDF pages are included, if both options `inkscapeformat=pdf` and `lastpage=true` are set. This is the default setting (unless DVI output is active) and can be switched off with `lastpage=false`. It's also possible to set the number of the last page included of a PDF graphic manually as optional parameter for `\includesvg` or `\includeinkscape`. For details, see the description of the respective commands.

2.4. Including SVG files

<code>\includesvg</code>	The command <code>\includesvg</code> to include a SVG file is quite similar to the <code>\includegraphics</code> command provided by the graphicx package.
--------------------------	---

```
\includesvg[<parameters>]{<svg filename>}
```

<code>inkscape</code> (param.)	It is used right in the same way but where <code><svg filename></code> is the file name of the SVG file, where any given file extension will be replaced with <code>.svg</code> ruthlessly. In order to change the source file format for the Inkscape export, you have to use parameter <code>svgextension</code> .
<code>inkscapeformat</code> (param.)	
<code>inkscapelatex</code> (param.)	
<code>inkscapearea</code> (param.)	
<code>inkscapedpi</code> (param.)	
<code>inkscapeopt</code> (param.)	
<code>svgextension</code> (param.)	

`width` (param.)

`height` (param.)

`distort` (param.)

`scale` (param.)

`pretex` (param.)

`apptex` (param.)

`draft` (param.)

³<https://inkscape.org/de/doc/inkscape-man.html>

⁴to provide compatibility for package **graphicx**, it's possible to use `keepaspectratio=true` as alias for `distort=false` and the other way round

⁵<https://bugs.launchpad.net/ubuntu/+source/inkscape/+bug/1417470>

respectively \dq both in paths and file names. Especially when DVI output is active using quotes will certainly cause an error.

The command `\includesvg` is intended to do an automated export with **Inkscape** at first, where the given SVG file is exported to a PDF/EPS/PS/PNG file (see `inkscapeformat`) and perhaps a correlating L^AT_EX file (see `inkscapelatex`). The export with **Inkscape** is only invoked, if the SVG file is newer than the exported graphic file or latter doesn't exist at all. Once the export has been done, the graphic file and maybe the L^AT_EX file are included.

All previously described options can also be used as optional parameters to `\includesvg` and do have the same effect as described before. However, the optional parameters specified have an effect only once when `\includesvg` is executed and remain unchanged afterwards.

`lastpage` (param.) In addition to the use of boolean values, the parameter `lastpage` can also be assigned a specific (integer) page number, which defines the last used page of a PDF graphic. This, just like the identically named option, has an effect only when `inkscapeformat=pdf` is set.

`angle` (param.) Both parameters correlate to the identically named parameters of the `\includegraphics`

`origin` (param.) command provided by the **graphicx** package. However, unlike to `\includegraphics`, they `angle` and `origin` are *always evaluated after width, height, distort and scale* by `\includesvg`, regardless of the used order of the given parameters. This is mainly due to the inclusion of the L^AT_EX files corresponding to the graphic files generated by **Inkscape**.

2.5. Including already exported SVG files

`\includeinkscape` If you don't want to make use of the automated export with **Inkscape** but the user-interface provided by the **svg** package, you can use `\includeinkscape` instead of `\includesvg`.

```
\includeinkscape[<parameters>]{<graphic filename>}
```

`inkscapeformat` (param.) You can use it similar to `\includesvg` but `<graphic filename>` has to be the filename
`inkscapeformat` (param.) of the already exported graphic file. If a valid file extension (.pdf/.eps/.ps/.png) is
`width` (param.) given, the current setting for `inkscapeformat` is overwritten. It's even possible to specify a
`height` (param.) file extension like `.pdf_tex` to activate `inkscapeformat`. Furthermore, all optional parameters
`distort` (param.) for `\includeinkscape` do have the same effect as described before for command `\includesvg`
`scale` (param.) once when `\includeinkscape` is executed and remain unchanged afterwards.

3. Usage of package **svg-extract**

This package allows the extraction of independent graphic files out of SVG files which have been included and rendered with L^AT_EX by the **svg** package. This is particularly useful when attempting to provide images to journals or collaborators, and one wishes the image to appear exactly as it does within the original L^AT_EX document.

In order to extract to PDF, EPS, or PS files the programs `pstoeps`, `pstopdf` and `pdftops` are used which are usually provided by most of the L^AT_EX distributions. In addition, the command line interfaces of **ImageMagick** and **Ghostscript** can be invoked for converting images in formats like PNG, JPG, TIF or something else. It's also possible to create PDF, EPS or PS files with one of the two programs. Therefore the desired program—`magick` and/or `gswin32c/gswin64c` on Windows respectively `convert` and/or `gs` on unix-like operating systems—must be installed. By typing `<program> --version` on shell, this can be checked.

If you want to extract independent graphic files from included SVG files, you only have to load **svg-extract**. All actions for the extraction process will be done by using `\includesvg` or `\includeinkscape`. Without any additional settings, the extraction will render the SVG file to the specified output format(s) of choice using the same settings as specified within the two commands. Consequently, the scale between the image and text in the extracted files will remain identical to the scale within the document from which the SVG file was extracted.

In contrast to package **svg**, the console commands for graphic extraction are executed with each LaTe_X run by package **svg-extract** when `--shell-escape` mode is activated. This behaviour can be switched off with option `extract=false`.

Important changes

In version v1.0 of package **svg** the extracted files were named like the numbering of the current **subfig** environment by default. As package **subfig** sometime causes problems and because of the large amount of different L^AT_EX packages which all provide the possibility to include subfigures with very different implementations, this feature can't be provided reliably by **svg-extract**. See option **extractname** for further information.

3.1. General settings

on (opt.)	This options have to be given while loading the svg-extract package and are intended to toggle the functionality of this package. As both extracting and converting independent graphic files is invoked with every L ^A T _E X run when --shell-escape is activated, the option off can be given to save compilation time, once the creation of all desired images has been done and they no longer need to be re-generated. The option on can be used to reactivate functionality of this package. This can also be done by using extract=true/false .
\svgsetup \includesvg \includeinkscape	With package svg-extract the applicable options for \svgsetup{<options>} as well as parameters for the already described macros \includesvg[<parameters>]{<svg filename>} and \includeinkscape[<parameters>]{<graphic filename>} are extended. They can be used to control the process of graphic extraction and converting.

All option described below can be used together with **\svgsetup** and are then valid in the current scope. There also exist identically named parameters for the optional arguments of

```
\includesvg[<parameters>]{<svg filename>}  
\includeinkscape[<parameters>]{<graphic filename>}
```

These have an effect only once, when the specific command is executed.

3.2. Extract independent graphic files

extract (opt.)	This option can be used with boolean values. Using extract=true activates the functionality for both extracting and converting which is the default setting, whereas extract=false turns it off completely.
extractpath (opt.)	The path where the extracted and converted files are located can be specified with option extractpath , whereas basesubdir is set by default.
svgdir/svgpath	The extracted and converted independent graphic files are located in the same directory as the corresponding SVG file.
svgsubdir/svgsubpath	Within the folder of the encountered SVG file, all extracted and converted files will be located in a subfolder named svg-extract/ .
basedir/basepath/jobdir/jobpath	All extracted and converted files will be located in the current working directory.
basesubdir/basesubpath/jobs subdir/jobs subpath	A subfolder named svg-extract/ within the current working directory will be used for all extracted and converted files.
/path/to/somewhere/	It is also possible to give a custom path, either relative to the current working directory (./relative/path/) or as an absolute path.
extractname (opt.)	It's also possible to change the name for extracted and converted files. The default setting is extractname=filenamenumbered . The appended file extension is derived from option extractformat .
filename/name	The name of the exported Inkscape file is used and the suffix -extract is attached.

filenamenumbered / *namenumerated* / *numberedfilename* / *numberedname*

Same as above, but a prefix with the current enumerated count of SVG files is used instead of the suffix.

numbered/section/numberedsection/sectionnumbered

The file name is composed by the current enumerated count of SVG files and the present outline numbering.

(filename)

You can use any file name. It's possible to use counters for specifying the name of the extracted file. Repeatedly specifying the same file name will overwrite previously created files.

extractformat (opt.)

The included SVG file can be extracted from the document into an independent graphic file of type PDF, EPS or PS. The option can be used with either a single value (**extractformat=pdf**) or a comma separated list. For example,

```
\includesvg[extractformat={pdf,eps,ps}]{<svg filename>}
```

will extract the SVG file to both PDF and EPS formats and generates two independent graphic files. By default, **extractformat=pdf** is set unless DVI output was detected. In this case **extractformat=eps** is the default setting.

extractwidth (opt.)

extractheight (opt.)

extractdistort (opt.)

extractscale (opt.)

extractpretex (opt.)

extractapptex (opt.)

These options can be used to overwrite the settings given for the appearance of a SVG file within the document. For example, a SVG file should cover the entire text width within the document but be extracted to a fixed width. This can be done with:

```
\includesvg[width=\textwidth,extractwidth=500pt]{<svg filename>}
```

Assigning the value **inherit** to one of these options—which is set by default—leads to the usage of the corresponding option of package **svg** (**width/height/scale/pretex/apptex**), whereas **extract...=\relax** can be used to ignore a parent option utterly.

extractpreamble (opt.)

extractpreambleend (opt.)

Within the included and extracted SVG files any L^AT_EX macro can be used either defined by the user—this should be done in the preamble of the L^AT_EX document in which the SVG file is to be included—or provided by a package which is loaded. As the extraction process of the SVG files needs an auxiliary L^AT_EX file all used packages and commands have to be known within this file. Consequently, the preamble of the current L^AT_EX document is used for the extraction of the SVG file by default.

However, it is possible to specify a different *preamble file* with the option **extractpreamble** where the file to use as the preamble is given as the argument—including maybe path, but file name and file extension in any case. The given preamble file is searched similar to SVG files meaning, every path given with **\svgpath** or **\graphicspath** is examined. The default definition of **extractpreamble** is **\jobname.tex**—more precisely the file extension given by option **latexext** is used—and should suffice for most cases. The preamble up to the line defined by the option **extractpreambleend** will be used, which is set to a default with **\begin{document}**.

\svghidepreamblestart

\svghidepreambleend

In case, the preamble of the current L^AT_EX document is used, there are maybe packages included or some parts within the preamble, which should not be used within the separate auxiliary L^AT_EX file. These parts can be excluded if they are enclosed by **\svghidepreamblestart** and **\svghidepreambleend**.

For example, your current L^AT_EX document uses package **showframe** which causes some problems with the extraction of independent graphic files. So you want to get rid of it within the auxiliary L^AT_EX file. This can be done with:

```
\documentclass{<documentclassname>}
...
\usepackage{svg-extract}
...
\svghidepreamblestart
\usepackage{showframe}
\svghidepreambleend
...
```

<code>extractruns</code> (opt.)	When extracting independent graphic files by compiling the generated auxiliary L ^A T _E X file, it's maybe necessary to do multiple L ^A T _E X iterations on this. The number of iterations is controlled with option <code>extractruns</code> . It is set to <code>extractruns=2</code> by default.
<code>latexexe</code> (opt.)	For the extraction of an independent graphic file, the L ^A T _E X program is used which is set by the <code>latexexe</code> option. Depending on the L ^A T _E X engine used for the current L ^A T _E X document, it is set to either <i>pdflatex</i> , <i>lualatex</i> , <i>xelatex</i> or <i>latex</i> by default. It's also possible to specify additional flags or switches for the L ^A T _E X iterations, which are performed during the extraction process by the <code>latexopt</code> option. If you are used to utilize a different extension for L ^A T _E X files than <code>.tex</code> , option <code>latexext=ltx</code> .
<code>dvipsopt</code> (opt.)	Depending on the used L ^A T _E X engine, the file type of the extracted graphic differs. In order to create all formats, requested with option <code>extractformat</code> , several converting tools provided by most of the L ^A T _E X distributions are maybe invoked. These are <code>dvips</code> , <code>ps2eps</code> , <code>ps2pdf</code> and/or <code>pdftops</code> and can't be changed. It's only possible to specify additional switches for every single tool with <code>dvipsopt</code> , <code>pstoepsopt</code> , <code>pstopdfopt</code> , <code>pdftoepsopt</code> and <code>pdftopsopt</code> .
<code>clean</code> (opt.)	During the extraction process many files are generated for each SVG file extraction. So it's oftentimes desirable to automatically remove these temporary files. Using the option <code>clean=true</code> will remove any generated files created other than the extracted output format(s) requested. Setting <code>clean=false</code> is useful for debugging and set by default. Additionally, it's possible to use option <code>clean</code> with a list of file extensions in order to specify auxiliary files generated by package <i>svg-extract</i> to be deleted, for example <code>clean={log,aux}</code> .
<code>exclude</code> (opt.)	Sometimes it may be necessary to extract and/or convert a SVG file without including it. If the flag <code>exclude</code> is specified, the SVG file will not be rendered in the current L ^A T _E X document, but will be extracted and/or converted to the requested output format(s).
<code>\includesvg</code> <code>\includeinkscape</code>	As previously mentioned, for extracting independent graphic files it is sufficient to load package <i>svg-extract</i> and afterwards everything necessary is done by just using <code>\includesvg</code> or <code>\includeinkscape</code> .
<code>extractangle</code> (param.)	With this additional parameter the graphic is rotated during the extraction process. The value is not inherited from <code>angle</code> if it was given by default. This can be achieved by setting:

```
\includesvg[angle=<angle>,extractangle=inherit]{<svg filename>}
```

3.3. Convert extracted graphic files

Based on the extraction of independent graphic files, the ***svg-extract*** packages also provides the possibility to convert these extracted graphics in another format than PDF, EPS or PS with either ***ImageMagick***—which is set by default—or ***Ghostscript***.

`convert` (opt.) This option can be used to control the invocation of the conversion process. By default, `convert=false` is set. For Windows, there exist two different versions of ***Ghostscript***, either 64 bit or 32 bit. If it is selected as converting tool the 64 bit executable is set by default. Please note, that option `extract` has to be activated.

`false/off/no`

No conversion is done.

`true/on/yes`

The conversion will be done with the current chosen converting tool.

`magick/imagemagick/convert`

The conversion is activated and ***ImageMagick*** is selected.

`gs/ghostscript`

The conversion is activated and ***Ghostscript*** is selected.

`gs64/ghostscript64`

This value activates ***Ghostscript*** as conversion tool and sets `gsexec=gswin64c`. On unix-like operating systems, the value for `gsexec` remains unchanged.

`gs32/ghostscript32`

The same as for the latter case applies, only option `gsexec=gswin32c` is set on Windows.

convertformat (opt.) With this option, the desired output format(s) can be given. Multiple graphic formats can be specified in a list, for example something like `convertformat={png,jpg,tif}`. The value specified in `extractformat` is used as the source format for the conversion. If `extractformat` itself contains a file list, the first value within this list is considered. If `extractformat` is defined empty, the file generated anyway during the extraction is used.

Settings for specific converting formats

Maybe it's desired to apply varying settings for different output formats. Therefor some options described below can either be set for all converted files or for a specific output format. In particular, these are the options `convertdpi` as well as `magicksetting`, `magickoperator`, `gsdevice` and `gsopt`. All these mentioned options can be used like either `<option>=<value>` or `<option>={<outputformat>}=<value>` and even `<option>={<outputformat>}+=<value>` where the desired output format is trailed with + as inner key.

The first variant is applied to all output formats in general. If one of these mentioned options is evaluated and an output format specific value was given like in the second variant, the general setting is overwritten. If the general setting should be used and extended by an additional output format specific settings, then the third variant is to be used. In this case, no output format specific setting (second variant) must not have been used.

If you want to reverse any setting, you only have to use `\relax` as a value, either for a general option (`<option>=\relax`) or a specific one (`<option>={<outputformat>}[+] =\relax`).

convertdpi (opt.) This option controls the used density for all file formats or a specific one, whether **ImageMagick** or **Ghostscript** is used for the graphic conversion. The desired resolution of the converted file is given in dots per inch (DPI) either as a scalar value (e.g. `convertdpi=600`) or with different resolutions in x- and y-direction (e.g. `convertdpi=600x400`).

As described before, it's also possible to declare a specific resolution for each desired converting format. For example, you want to set different resolution for PNG and JPG formats and something for all other formats:

```
\svgsetup{%
    convertdpi={png=600},%
    convertdpi={jpg=150},%
    convertdpi=300%
}%
```

If a setting for a specific output format is given, any unspecific setting is overwritten, when the conversion to this format is done. With `convertdpi={<outputformat>}=\relax` a specific setting can be reversed.

Please note that not every graphic format support different resolutions in x- and y-direction. So using a value like `convertdpi=600x400` may not necessarily lead to the desired result. However, this is then due to the used conversion tool and not to the processing of the option.

3.3.1. Settings for the invocation of **ImageMagick**

magickexe (opt.)
magicksetting (opt.)
magickoperator (opt.) The conversion with **ImageMagick** via the `magick` or `convert` command line interface can be controlled with these options. The option `magickexe` determines the used executable and is set to `magick` on Windows and otherwise to `convert` by default. Additionally, there are the two options `magicksetting` and `magickoperator` which can be used to define *settings* and *operators* for the conversion process. As described before, the two options `magicksetting` and `magickoperator` can be set for all output formats or a *specific* one either resetting or extending the general settings. For further information see the documentation of **ImageMagick** command line interface⁶.

⁶<http://www.imagemagick.org/script/command-line-processing.php>

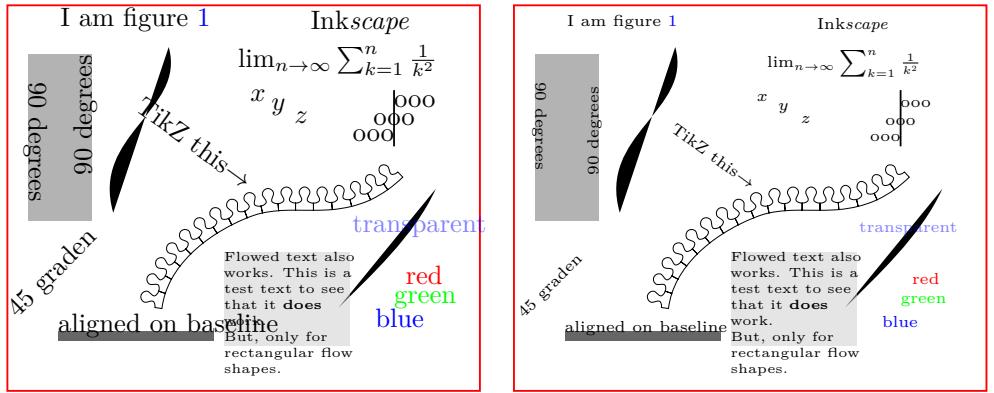

3.3.2. Settings for the invocation of *Ghostscript*

gsexec (opt.) The conversion with **Ghostscript** is done with command line interface **gswin64c** or **gswin32c** on Windows and **gs** on unix-like operating systems. The executable can be changed with option **gsexec**. Because **Ghostscript** requires the specification of a device, there are some predefined for the most common output formats. These are:

```
\svgsetup{%
  gsdevice={png=png16m},gsdevice={jpeg=jpeg},gsdevice={jpg=jpeg},%
  gsdevice={tif=tiff48nc},gsdevice={tiff=tiff48nc},%
  gsdevice={eps=eps2write},gsdevice={ps=ps2write}%
}%
```

Furthermore, with **gsopt** additional switches for **Ghostscript** can be set. As described before, both **gsdevice** and **gsopt** can be defined in general or for specific output formats. For further information see the documentation of **Ghostscript**⁷.

⁷<https://ghostscript.com/doc/current/Use.htm>

(a) This text is too large!

(b) This text fits better.

Figure 1: An example figure with \LaTeX support

4. Example

As an minimal example⁸ take the following lines of code:

```
\documentclass{article}
\usepackage[T1]{fontenc}
\usepackage{svg}
\usepackage[off]{svg-extract}
\svgsetup{clean=true}
%\pdfsuppresswarningpagegroup=1
\usepackage{relsize}
\usepackage{subcaption}
\begin{document}
\begin{figure}
\begin{minipage}{\dimexpr\linewidth/2\relax}
\includesvg[width=\linewidth]{svg-example}%
\subcaption{This text is too large!}%
\end{minipage}%
\begin{minipage}{\dimexpr\linewidth/2\relax}
\includesvg[width=\linewidth,pretex=\relscale{0.6}]{svg-example}%
\subcaption{This text fits better.}%
\end{minipage}
\caption{An example figure with \LaTeX-support\label{fig:example}}%
\end{figure}
\begin{figure}\centering
\includesvg[% width=.5\linewidth,inkscapelatex=false,extractformat={pdf,eps}%
]{svg-example}%
\caption{The same example figure without \LaTeX-support}%
\end{figure}
\end{document}
```

The output is shown in [Figure 1](#) and [Figure 2](#). Within this example the file `svg-example.svg` was included three times using the `\includesvg` command.

If you are willing to compile the example, there are two aspects to consider. First, the included SVG file `svg-example.svg` has to be located in the current folder and is located in `<texmf>/doc/latex/svg/`. Second, you have to run the desired \LaTeX engine with flag `--shell-escape`.

As you can see, [Figure 1a](#) is created with default settings, except the width specification. The **Inkscape** export with \LaTeX support is done and the extraction of an independent graphic file in PDF format as the **svg-extract** package was loaded.

⁸The image used here is a slightly modified version of the image used in the initial documentation on how to include a SVG file in \LaTeX by Johan B. C. Engelen available as package **svg-inkscape** on [CTAN](#).

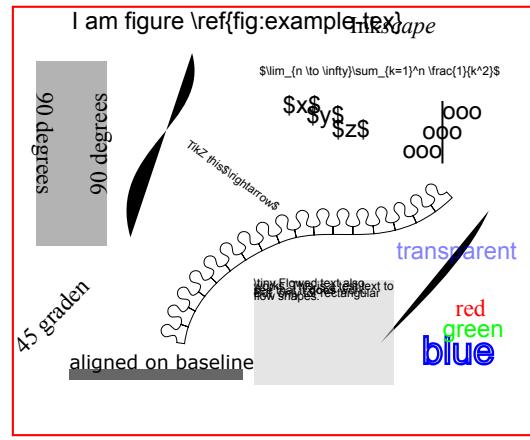

Figure 2: The same example figure without L^AT_EX support

However, the text is slightly overrunning the margins of the image, and so [Figure 1b](#)—which again uses the same **Inkscape** export results—decreases the font size of the text within the image relative using the `pretex` option together with the `\rescale` command provided by the **relsize** package.

In [Figure 2](#) the same SVG file was used but without the export of a separate L^AT_EX file containing all text elements.

Feel free to use this given example to try out all the options and possibilities described in [section 2](#) for package **svg**. Especially if you want to use package **svg-extract** for the automated extraction of independent graphics ([subsection 3.2](#)) and their conversion to different graphic formats with **ImageMagick** and/or **Ghostscript** ([subsection 3.3](#)), this example can be easily used for the first steps.

5. Troubleshooting and reporting issues

When using the packages **svg** and **svg-extract**, the most likely occurring problems will be caused by calling the external programs. For this reason, a short package information is written into the log file right before each call of an external program on shell. If a file should have been created, both packages check after the external call, whether this file exists or not and raise an error or at least a warning, if this file is missing. If you got such a message, please check the log file for lines like:

Package **svg** Info: or Package **svg-extract** Info:

Right afterwards, there should appear `runsystem(<command>)...executed.` which you should try to execute manually at the terminal in the right directory. In most cases, the problem will be an invalid command call. If something goes wrong during the extraction/-converting process of package **svg-extract**, it would make sense to set option `clean=false` to not delete any auxiliary files that might be needed.

If you are sure that the problem is not caused by the configuration of your operating system, you can send an error report either via email or create a new issue on GitHub. Both addresses can be found on the title.

When using pdfL^AT_EX there are a lot of warnings

It may happen that several warnings like

```
pdfTeX warning: pdflatex.exe(file <filename>.pdf): PDF inclusion:  
multiple pdfs with page group included in a single page
```

occur when including the PDF graphics exported with **Inkscape**. This is related to the handling of transparency effects within PDF files. Since pdfL^AT_EX version 1.40.15 or later,

you can get rid of these messages by using `\pdfsuppresswarningpagegroup=1`. See also the discussion on [TeX Stack Exchange](#)⁹ for more information.

6. Include SVG files created with **ROOT**

This section was originally written by Philip Ilten. In the hope that since then nothing has changed fundamentally in the described procedure. This passage remains in the documentation, even if it will almost certainly be relevant to experimental particle physicists only, who frequently use the analysis package **ROOT**.

ROOT has the ability to export directly to a SVG file, which means that it is possible to completely by-pass all of **ROOT**'s internal text rendering machinery, and let **LATEX** handle the text natively. This means that all of the ugly fonts that are rendered by **ROOT** can now be completely avoided, with the additional bonus of being able to add references within plots. So how does one go about using this package with **ROOT**?

1. Create the plot with **ROOT** as normal, but turn off all **LATEX** interpretation of text strings. This is a bit tricky, but can be accomplished by setting the font in **ROOT** to a precision of zero as described in the documentation for `TAttFill`¹⁰. Remember that the font is set by using the function `(TAttFill*)->SetTextFont(i)` with

$$i = (\text{font type}) \times 10 + (\text{font precision})$$

In the following lines of code, a `TStyle` is defined which sets the font to type “Courier New” with a precision of zero.

```
TStyle *style = new TStyle("style","style"); int FONT = 80;
style->SetTextFont(FONT);
style->SetLabelFont(FONT, "XYZ");
style->SetTitleFont(FONT, "XYZ");
style->SetTitleFont(FONT, "");
gROOT->SetStyle("style");
gROOT->ForceStyle();
```

Now, you can just use the well-known standard **LATEX** syntax for creating labels, etc. Note however, that backslashes have to be escaped due to interpretation of special characters by **C++**.

2. Print the plot as a SVG file.

```
gPad->Print("foo.svg");
```

3. Include the SVG file within the document using this package.

```
\usepackage{svg}
\usepackage{svg-extract}
\svgsetup{clean=true}
...
\includesvg[width=\ linewidth]{foo}
```

Consider the following example image produced by **ROOT** in [Figure 3](#). This figure was generated by the **ROOT** macro `root.C`, provided within `\texmf/doc/latex/svg/`, which produces the file `root.svg` when run. The code used to produce this SVG file from within **ROOT** is

```
void root() {
    // Set the style.
    gStyle->SetTextFont(80);      gStyle->SetLabelFont(80, "XYZ");
    gStyle->SetTitleFont(80, ""); gStyle->SetTitleFont(80, "XYZ");
    gStyle->SetPalette(1);       gStyle->SetOptStat(0);
```

⁹<http://tex.stackexchange.com/questions/76273/>
¹⁰<http://root.cern.ch/root/html/TAttText.html>

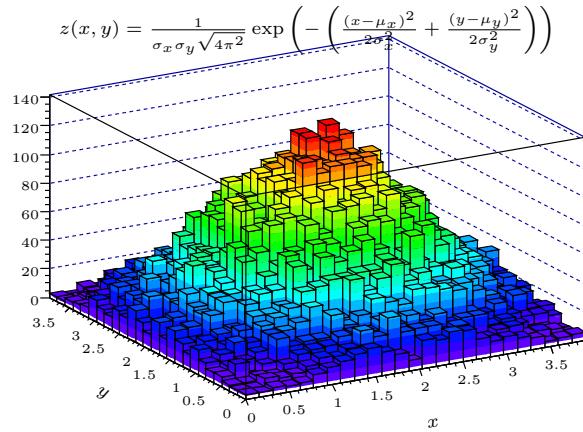

Figure 3: Rendering of a **ROOT** plot—no more *Comic CERNs*

```
// Draw the plot.
TH2D *h = new TH2D("", "", 25, 0, 3.9, 25, 0, 3.9); TRandom r;
for (int i = 0; i < 30000; i++) h->Fill(r.Gaus(2.,1), r.Gaus(2.,1));
h->GetXaxis()->CenterTitle(); h->GetXaxis()->SetTitleOffset(2.5);
h->GetYaxis()->CenterTitle(); h->GetYaxis()->SetTitleOffset(2.5);
h->GetXaxis()->SetTitle("\\"larger[2]$x\$");
h->GetYaxis()->SetTitle("\\"larger[2]$y\$");
h->Draw("LEGO2");

// Draw additional text.
TText *t = new TText(); t->SetTextAlign(31);
t->DrawText(0.7, 0.9, "\\"larger[2]$z(x,y) = \\"frac{1}{\\"sigma_x\\"sigma_y"
    "\\"sqrt{4\\"pi^2}\\"}\\"exp\\"left(-\\"left(\\"frac{(x-\\"mu_x)^2}{2\\"sigma_x^2} + \\"frac{(y-\\"mu_y)^2}{2\\"sigma_y^2}\\"right)\\"right)\$");

// Print the plot.
gPad->Print("root.svg");
}
```

where the text produced within the **ROOT** plot is set to a precision of zero.

The plot was then included within this document using the following L^AT_EX code

```
\begin{figure}
\centering%
\includesvg[% 
  inkscapearea=page,height=6cm,pretex=\tiny,convertformat=png%
]{root}%
\caption{%
  Rendering of a \app{ROOT} plot---no more \emph{Comic CERNs}%
  \label{fig:root}%
}%
\end{figure}
```

which includes the graphic as well as the L^AT_EX file exported by **Inkscape**, produces the extracted PDF image (*root.pdf*) and converts this to a PNG image (*root.png*) by using **ImageMagick**. Enjoy plots from **ROOT** with natively rendered L^AT_EX!

Part II.

Implementation

A. Initialization

A.1. Packages

The package **svg** mainly requires **scrbase** for options processing and **graphicx** for the inclusion of the exported graphic files.

The packages **iftex** and **pdftexcmds** are needed to detect the used L^AT_EX engine on the one hand and enabling pdfT_EX primitives independent of the used L^AT_EX engine on the other hand. Additionally, **trimspaces** is responsible for string manipulation. Both packages **shellesc** and **ifplatform** are used for engine independent access to systems commands and files. The package **svg-extract** only needs package **svg** itself, which is loaded during initialization.

```
1 <*main>
2 \RequirePackage{iftex}[2020/03/06]
3 \RequirePackage{scrbase}[2020/04/19]
4 \RequirePackage{pdftexcmds}[2019/11/24]
5 \RequirePackage{trimspaces}[2009/09/17]
6 \RequirePackage{graphicx}[2019/11/30]
7 \RequirePackage{shellesc}[2019/11/08]
```

In order to do not raise a warning, package **ifplatform** is only used if `--shell-escape` flag is enabled.

```
8 \ifnum\pdf@shellescape=\@ne\relax
9   \RequirePackage{ifplatform}[2017/10/13]
10 \fi
11 </main>
```

A.2. Dealing with catcodes

The catcode for double quotes are temporarily changed and restored at the very end of both packages.

```
12 \edef\svg@catcodecodes@restore{%
13   \catcode`\noexpand\"=\\catcode`\"\\relax%
14 }
15 \makeother"`
16 \AtEndOfPackage{\svg@catcodecodes@restore}
```

A.3. General macros

```
\svg@tempa Internal temporary macros.
\svg@tempb
\if@svg@tempswa
  17 \newcommand*\svg@tempa{}
  18 \newcommand*\svg@tempb{}
  19 \newif\if@svg@tempswa
```

A.3.1. Macros for process control

\svg@ifwindowsdetected Do some Windows specific stuff if it was detected.

```

20 \newcommand*\svg@ifwindowsdetected{\@secondoftwo}
21 \AfterPackage*[ifplatform]{%
22   \renewcommand*\svg@ifwindowsdetected{%
23     \ifwindows%
24       \expandafter\@firstoftwo%
25     \else%
26       \expandafter\@secondoftwo%
27     \fi%
28   }%
29 }

```

\svg@ifvalueisrelax For some keys the usage of \relax as a value should lead to a special reaction, such as restoring to default behavior or reseting the key. Therefore, \svg@ifvalueisrelax checks, whether \relax was used as value or not.

```

30 \newcommand*\svg@ifvalueisrelax[1]{%
31   \begingroup%
32   \def\svg@tempa{\#1}%
33   \def\svg@tempb{\relax}%
34   \ifx\svg@tempa\svg@tempb%
35     \aftergroup\@firstoftwo%
36   \else%
37     \aftergroup\@secondoftwo%
38   \fi%
39   \endgroup%
40 }

```

\svgx@ifkeyandval It is checked whether a key was given as `<key>=<value>` or like `<key>={<format>}=<value>`.

```

41 \newcommand*\svgx@ifkeyandval{}
42 \newcommand*\svgx@ifkeyandval[3]{%
43   \def\svgx@ifkeyandval##1##2##3\@nil{\IfArgIsEmpty{##3}{##2}{}}%
44   \svgx@ifkeyandval#1=\@nil%
45 }

```

A.3.2. String manipulation

Both packages **svg** and **svg-extract** should be able to handle user-defined input and output paths. As there is the possibility for users to provide paths with or without quotes to L^AT_EX, this is taken into account.

\svg@deactivate@dq In order to avoid errors concerning file names with package **babel** and it's active double quotes, this command is defined.

```

46 \newcommand*\svg@deactivate@dq{}
47 \AfterPackage+{babel}{%
48   \renewcommand*\svg@deactivate@dq{\bbl@deactivate{"}}%
49   \providecommand*\bbl@deactivate[1]{}%
50 }

```

\svg@sanitize@dq Save expansion of the second argument in the macro from the first argument with deactivated double quotes.

```

51 \newcommand*\svg@sanitize@dq[2]{%
52   \begingroup%
53   \svg@deactivate@dq%
54   \edef\svg@tempa{\endgroup\def\noexpand#1{\#2}}%
55   \svg@tempa%
56 }

```

\svg@quotes@check During the treatment of paths, it may be necessary to temporarily remove quotes and, if required, add them again later. For this purpose, the switch \if@svg@quotes@found as well as the commands \svg@quotes@check and \svg@quotes@@check, which controls the switch, are defined. As before, the string is passed in a macro to \svg@quotes@check.

```

57 \newif\if@svg@quotes@found
58 \newcommand*\svg@quotes@check[1]{%
59   \expandafter\svg@quotes@@check#1"\@nil%
60 }
61 \newcommand*\svg@quotes@@check(){}
62 \def\svg@quotes@@check#1"#2\@nil{%
63   \IfArgIsEmpty{#2}{\@svg@quotes@foundfalse}{\@svg@quotes@foundtrue}%
64 }

```

\svg@quotes@remove These two commands are used to remove all occurring quotes within a string. The only argument passed to \svg@quotes@remove is not the string itself but a macro in which a string is stored.

```

65 \newcommand*\svg@quotes@remove[2][]{%
66   \begingroup%
67   \IfArgIsEmpty{#1}{\def\svg@tempb{#2}{\def\svg@tempb{#1}}}{%
68     \svg@sanitize@dq\svg@tempa{\svg@tempb}%
69     \expandafter\svg@quotes@check\expandafter{\svg@tempa}%
70     \expandafter\svg@quotes@remove\svg@tempa""\@nil%
71     \edef\svg@tempb{%
72       \endgroup%
73       \def\noexpand#2{\svg@tempa}%
74       \if@svg@quotes@found%
75         \noexpand\@svg@quotes@foundtrue%
76       \else%
77         \noexpand\@svg@quotes@foundfalse%
78       \fi%
79     }%
80     \svg@tempb%
81   }%
82 \newcommand*\svg@quotes@@remove(){}
83 \def\svg@quotes@@remove#1"#2"#3\@nil{%
84   \IfArgIsEmpty{#2}{%
85     \edef\svg@tempa{#1}%
86   }{%
87     \svg@quotes@remove#1#2#3""\@nil%
88   }%
89 }

```

\svg@remove@leadingchar This command removes the single character in given with the first argument from the expanded macro in the second argument.

```

90 \newcommand*\svg@remove@leadingchar[2]{%
91   \begingroup%
92   \svg@sanitize@dq\svg@tempa{#2}%
93   \def\svg@tempb{%
94     \def\svg@tempa####1\@nil{\def\svg@tempa{####1}}%
95     \kernel@ifnextchar#1{%
96       {\expandafter\svg@tempa@gobble}%
97       {\svg@tempa}%
98     }%
99     \expandafter\svg@tempb\svg@tempa\@nil%
100    \edef\svg@tempb{%
101      \endgroup%
102      \def\noexpand#2{\svg@tempa}%
103    }%
104    \svg@tempb%
105 }

```

A.3.3. File handling

`\svg@filename@parse` As the internal L^AT_EX command `\filename@parse` is not able to split a given file name containing quotes, `\svg@filename@parse` is defined to resolve this problem. The optional argument can be used to give a specific file extension, which should be searched within `\filename@ext`. If found at the very end, the previous part is appended to `\filename@base`.

```
106 \newcommand*\svg@filename@parse[2] []{%
107   \begingroup%
```

The given path and file is parsed with `\filename@parse`.

```
108   \svg@sanitize@dq\svg@tempa{#2}%
109   \expandafter\filename@parse\expandafter{\svg@tempa}%
110 % If there are quotes in the file path, the closing one will be found as first
111 % character in \cs{filename@base} as \cs{filename@area} is splitted at the last
112 % slash. This leading quote is removed from \cs{filename@base} with
113 % \cs{svg@remove@leadingchar}.
114 %   \begin{macrocode}
115   \svg@quotes@remove{\filename@area}%
116   \if@svg@quotes@found%
117     \edef\filename@area{\filename@area"}%
118     \svg@remove@leadingchar"\filename@base"%
119   \fi%
```

The found extension is parsed against the optional argument. If a double quote was found within the extension, it actually belongs to `\filename@base`.

```
120   \ifx\filename@ext\relax\else%
121     \svg@quotes@remove{\filename@ext}%
122     \svg@extension@parse{#1}%
123     \if@svg@quotes@found%
124       \edef\filename@base{\filename@base"}%
125     \fi%
126   \fi%
```

Quotes within `\filename@base` are normalized.

```
127   \svg@quotes@remove{\filename@base}%
128   \if@svg@quotes@found%
129     \edef\filename@base{\filename@base"}%
130   \fi%
```

With `\svg@tempa` the group is closed and the results are saved in the macros `\filename@...`

```
131   \edef\svg@tempa{%
132     \endgroup%
133     \def\noexpand\filename@area{\filename@area}%
134     \def\noexpand\filename@base{\filename@base}%
135     \ifx\filename@ext\relax%
136       \let\noexpand\filename@ext\noexpand\relax%
137     \else%
138       \def\noexpand\filename@ext{\filename@ext}%
139     \fi%
140   }%
141   \svg@tempa%
142 }
```

`\svg@extension@parse` These macros are used to permit multiple dots in file names. The content of `\filename@ext` is split at each occurrence of . and the trailing part is compared against the content of the argument of `\svg@extension@parse`, which is probably `\svg@file@ext`. If they are equal, the previous part is appended to `\filename@base` and `\filename@ext` is set to the content of the first argument.

```
143 \newcommand*\svg@extension@parse[1]{%
144   \IfArgIsEmpty{#1}{}{%
```

```

145      \@expandtwoargs\Ifstr%

```

B. Including SVG files with package `svg`

B.1. Options

All options, which can be set either as package options or with `\svgsetup`, as well as the optional parameters for both user commands `\includesvg[parameters]{{svg filename}}` and `\includeinkscape[parameters]{{graphic filename}}` are defined with the interface provided by package `scrbase`.

```

276 \DefineFamily{SVG}
277 \DefineFamilyMember{SVG}

```

`\svg@deprecated@key` With version v2.00 the whole user-interface was renewed. For reasons of compatibility, outdated options and parameters from version v1.0 are also provided. If an old key was given, a warning is issued and the valid key is used.

```

278 \newcommand*\svg@deprecated@key[3][svg]{%
279   \PackageWarning{#1}{%
280     The option key '#2' is deprecated. \MessageBreak%
281     It's recommended to use '#3'\MessageBreak%
282     instead%
283 }

```

```

283   }%
284 \FamilyOptions{SVG}{#3}%
285 }

```

Within the exported L^AT_EX files of **Inkscape**, some commands are used out of additional packages. But maybe the user doesn't want to load this packages anyhow.

<pre> usexcolor (opt.) noxcolor (opt.) \if@svg@use@xcolor usetransparent (opt.) notransparent (opt.) \if@svg@use@transparent </pre>	Options for preventing packages xcolor and transparent to be loaded. <pre> 286 \newif\if@svg@use@xcolor 287 \FamilyBoolKey{SVG}{usexcolor}{@svg@use@xcolor} 288 \DeclareOption{noxcolor}{\FamilyOptions{SVG}{usexcolor=false}} 289 \newif\if@svg@use@transparent 290 \FamilyBoolKey{SVG}{usetransparent}{@svg@use@transparent} 291 \DeclareOption{notransparent}{\FamilyOptions{SVG}{usetransparent=false}} </pre>
---	--

They are only available during the loading process of package **svg**.

```

292 \AtEndOfPackage{%
293   \RelaxFamilyKey{SVG}{usexcolor}%
294   \RelaxFamilyKey{SVG}{usetransparent}%
295   \if@svg@use@xcolor%
296     \RequirePackage{xcolor}[2016/05/11]%
297   \else%
298     \AfterPackage*{xcolor}{%
299       \PackageWarning{svg}{Package ‘xcolor’ was loaded anyway}%
300     }%
301   \fi%
302   \if@svg@use@transparent%
303     \RequirePackage{transparent}[2019/11/29]%

305     \AfterPackage*{transparent}{%
306       \PackageWarning{svg}{Package ‘transparent’ was loaded anyway}%
307     }%
308   \fi%

```

There is an issue¹¹ with package **transparent**, which currently implements an *invalid* check relying on internal commands of package **pgfsys**, whereas these have changed in the latest version.

```

309 \AfterPackage*{transparent}{%
310   \@ifpackagelater{transparent}{2018/11/19}{}{\RequirePackage{pgfsys}}%
311 }%
312 }

```

B.1.1. The invocation of **Inkscape**

The Application **Inkscape** is used to create includable graphic files in a desired format (PDF/EPS/PS/PNG) out of files in SVG format, whereas the support of L^AT_EX can optionally be used.

<pre> inkscape (opt.) \svg@ink@mode </pre>	The intension of option inkscape is to control the running behaviour of Inkscape . It can be switched off at all (inkscape=false) or invoked only if necessary (inkscape=true) and even be forced with every L ^A T _E X run (inkscape=forced). Additionally, option inkscape can be used as wrapper for options inkscapeformat , inkscapelatex , inkscapearea and inkscapedpi , which are declared later.

```

B.1.2. Setting input folder and file

`svgpath` (opt.) In version v1.0 setting the path to SVG files was done via option. So this method is provided as well.

```

503 \DefineFamilyKey{SVG}{svgpath}{%
504   \PackageWarning{svg}{%
505     The key 'svgpath' is deprecated. It's recommended\MessageBreak%
506     to use '\string\svgpath' instead%
507   }%
508   \ifx\svgpath\@undefined%
509     \AtEndOfPackage{\svgpath{\#1}}%
510   \else%
511     \svgpath{\#1}%
512   \fi%
513   \FamilyKeyStateProcessed%
514 }

```

`svgextension` (opt.) This option modifies the expected extension for the input file which is exported with **Inkscape**. It is set to `svg` by default.

`extension` (opt.)
`ext` (opt.)
`\svg@file@ext`

```

515 \newcommand*\svg@file@ext{svg}
516 \DefineFamilyKey{SVG}{svgextension}{%

```

The extension should be in lower case letters.

```

517   \lowercase{\svg@quotes@remove[\#1]{\svg@file@ext}}%

```

```

B.1.4. Options for the inclusion of graphics

After the graphic export with **Inkscape**, the inclusion of those graphics can be controlled with the following options.

width (opt.)
 `\svg@param@width` These options determine the size of the included graphics. The usage of `\relax` as value resets the respective option to the default behavior.

height (opt.)
 `\svg@param@width`

distort (opt.)
 `\svg@param@width`

keepaspectratio (opt.)
 `\if@svg@param@distort`

scale (opt.)
 `\if@svg@param@distort`

width (opt.)
 `\svg@param@width`
 `\DefineFamilyKey{SVG}{width}{%`
 `\FamilyKeyStateUnknownValue%`
 `\svg@ifvalueisrelax{\#1}{%`
 `\renewcommand*\svg@param@width{\z@}%`
 `\FamilyKeyStateProcessed%`
 `\}{%`
 `\FamilySetLengthMacro{SVG}{width}{\svg@param@width}{\#1}%`

```

561     \ifx\FamilyKeyState\FamilyKeyStateProcessed%
562         \ifdim\svg@param@width<\z@\relax%

643       \FamilySetCounter{SVG}{lastpage}{\svg@param@lastpage}{\z@}%
644     \fi%
645   \fi%
646 }

```

`draft` (opt.) The option `draft` has the same effect as the eponymous option of package **graphicx**.
`\if@svg@draft`

```

647 \newif\if@svg@draft
648 \FamilyBoolKey{SVG}{draft}{@svg@draft}
649 \AfterPackage*[graphicx]{\ifGin@draft \@svg@drafttrue\fi}

```

B.2. User commands

B.2.1. Optional parameters for user commands

The family member is defined for both **svg** and **svg-extract**.

```

650 <*package & body>
651 \DefineFamilyMember[.param]{SVG}{}
652 </package & body>

```

`\svg@local@param@def` Most of the package options can also be used as optional parameters for `\includesvg` or `\includeinkscape`. Some of them are overloaded for the usage as optional argument and there are some keys, which *only* can be used as optional parameters. This is realized in such a way that `\svg@local@param@use` is extended with `\svg@local@param@def` by the definition of local keys during the loading of package **svg**.

```

653 \newcommand*\svg@local@param@use(){}
654 \newcommand*\svg@local@param@def[1]f{%
655   \edef\svg@local@param@use{%
656     \unexpanded\expandafter{\svg@local@param@use}\unexpanded{#1}%
657   }%
658 }
659 \newcommand*\svg@local@param@set[1]f{%
660   \svg@local@param@use%
661   \FamilyOptions{SVG}{#1}%

```

As `\svg@local@param@set` is always used in a local group, it is possible to set `inkscapelatex` to `false`, if the output format was set to `png` with option `inkscapeformat`.

```
662 \Ifstr{\svg@ink@format}{png}{\FamilyOptions{SVG}{inkscapelatex=false}}{}%
```

Using `distort=true` is only reasonable, if `height` and `width` are given.

```
663 \@svg@tempswatru%
664 \ifdim\svg@param@width>\z@\relax\ifdim\svg@param@height>\z@\relax%
665   \@svg@tempswafalse%
666 \fi\fi%
667 \if@svg@tempswa%
668   \FamilyExecuteOptions[.svg.sty]{SVG}{distort=false}%
669 \fi%
670 }
```

`\svg@deprecated@param` This macro checks, if `\svgwidth` or `\svgscale` are defined. In this case, the given values are passed to the correlating parameters and a warning is raised.

```
671 \newcommand*\svg@deprecated@param{%
672   \@svg@tempswafalse%
673   \ifx\svgwidth\undefined\else%
674     \edef\svg@tempa{\noexpand\FamilyOptions{SVG}{width=\svgwidth}}%
675     \svg@tempa%
676   \@svg@tempswatru%
677   \fi%
678   \ifx\svgscale\undefined\else%
679     \edef\svg@tempa{\noexpand\FamilyOptions{SVG}{scale=\svgscale}}%
680     \svg@tempa%
681   \@svg@tempswatru%
682   \fi%
683   \if@svg@tempswa%
684     \PackageWarning{svg}{%
685       You should specify the image size with parameters\MessageBreak%
686       'width' and 'height' or 'scale' instead of using\MessageBreak%
687       '\string\svgscale' or '\string\svgwidth'%
688     }%
689   \let\svgwidth\undefined%
690   \let\svgscale\undefined%
691   \fi%
692 }
```

B.2.2. Definition of user commands

`\svgsetup` The macro `\svgsetup` can be used to change options after loading the package **svg** both in preamble and the document body. For compatibility reasons, `\setsvg` is also defined.

```
693 \newcommand*\svgsetup{\FamilyOptions{SVG}}
694 \newcommand*\setsvg{\FamilyOptions{SVG}}
```

`\svgpath` With `\svgpath` the user can give several root paths to SVG files in the same way as `\graphicspath` is used. The only difference is that a missing slash is added at the end of the path, if needed.

```
695 \newcommand*\svg@input@path{}%
696 \let\svg@input@path\input@path%
697 \newcommand*\svgpath[1]{%
698   \def\svg@tempa##1\@nil{%
699     \ifx\svg@tempb\bgroup%
700       \def\svg@input@path{\#1}%
701     \else%
702       \def\svg@input@path{\#1}%
703     \fi%
704   }%
```

```
705 \futurelet\svg@tempb\svg@tempa#1\@nil%
706 }
```

\includesvg For the inclusion of SVG files the command \includesvg is defined.

```
707 \newcommand*\includesvg[2][]{%
708   \begingroup%
```

Checking for deprecated commands \svgwidth and \svgscale.

```
709   \svg@deprecated@param%
```

inkscape (param.)
inkscapeformat (param.)
inkscapelatex (param.)
inkscapearea (param.)
inkscapedpi (param.)
inkscapeopt (param.)
svgextension (param.)
 width (param.)
 height (param.)
 distort (param.)
 scale (param.)
 pretex (param.)
 apptex (param.)
 draft (param.)

Most of the optional parameters have the same effect as the identically named options. Only parameter **lastpage** is extended (see below). Moreover, there are some additional parameters, which can only be used as optional argument for \includesvg (**angle** and **origin**) but not as an option. Now all parameters are set in local context (within a group).

```
710   \svg@local@param@set{#1}%
```

The file suffix used by both packages **svg** and **svg-extract**.

```
711   \if@svg@ink@latex%

\svg@ink@ver@settings As the command line interface of **Inkscape** has changed between versions 0.x and 1.x, option `inkscapeversion=detect` allows to detect the used version of **Inkscape** in order to define the calling macro `\svg@ink@cmd`. The obtained version is stored in `\svg@ink@ver`, whereas the following meanings are applied:

-1 version check has not be done or **Inkscape** could not be found/executed

0 **Inkscape** version 0.x was found

1 **Inkscape** version 1.x or later was found

All necessary information are stored within `\svg@ink@ver@settings` as three arguments, whereas the first one is the manually set version, the second is the used `inkscapeexe` for automatic detection and the third one is the detected version itself.

```

1080 \newcommand*\svg@ink@ver@settings{{\svgt@ink@ver}{\svgt@ink@exe}{\m@ne}}
1081 \newif\if@svgt@ink@ver@detect

```

In order to run the check for **Inkscape** version at the beginning of the document only if needed, changes of both `inkscapeversion`—at this point stored in `\svg@ink@ver`—as well as `inkscapeexe` are detected and are triggering the version check. After evaluating the triggers, the current values set are stored as two tokens in `\svg@ink@ver@settings`. If a check has been triggered, the detected version will be evaluated further on and is stored in the third token of `\svg@ink@ver@settings`.

```

1144     }%
1145   \fi%
1146 }
```

B.4. Handling path and file names

`\svg@set@input@path` In order to import SVG files from different folders, `\svg@set@input@path` evaluates several macros, which are supposed to be used for holding different search folders. Any given path will be handled by `\svg@normalize@path`. The optional argument can be used to append an additional search path.

```
1147 \newcommand*{\svg@set@input@path}[1][]{%
1148   \begingroup%
1149     \svg@deactivate@dq%
```

If a path was already found and stored within `\svg@file@path`, it is searched first and wrapped in curly braces. This is necessary for using commands like `\input{<tex filename>}` within SVG files.

```
1150 \ifx\svg@file@path\empty\else%  
1151   \svg@normalize@path{\svg@file@path}%  
1152   \edef\svg@file@path{{\svg@file@path}}%  
1153 \fi%
```

Afterwards, several search paths are appended. If `\svgpath` was used, it is searched next. If nothing was found, `\graphicspath` is considered if defined followed by a path given in the third argument. If nothing was found yet, the standard `\input@path` is searched last.

```
1154     \svg@append@input@path{\svg@file@path}{\svg@input@path}%
1155     \svg@append@input@path{\svg@file@path}{\Ginput@path}%
1156 \IfArgIsEmpty{#1}{\svg@append@input@path{\svg@file@path}{\#1}}%
1157 \svg@append@input@path{\svg@file@path}{\input@path}%
```

Finally, \input@path is set.

```
1158 \edef\svg@tempa{%
1159   \endgroup%
1160   \ifx\svg@file@path\empty\else%
1161     \def\noexpand\input@path{\svg@file@path}%
1162   \fi%
1163 }%
1164 \svg@tempa%
1165 }
```

Only, if a certain search path is defined, it is added. The paths given in the first argument are compared to each path in the second argument and only new ones are added.

```
1166 \newcommand*{\svg@append@input@path}[2]{%
1167   \ifx#2\@undefined\else%
1168     \edef\svg@tempb{\#2}%

1187 }

```

\svg@get@path
\if@svg@file@found
\svg@file@path
\svg@file@name
\svg@file@base
\svg@file@suffix

The command \svg@get@path tries to find a given SVG file. If the searched file wasn't found in the current path, all paths given with \svgpath are evaluated. If there was no appropriate file again, all paths given by \graphicspath are examined. In the last step, a given path within the second mandatory argument is browsed. The results for file path and name are stored in \svg@file@path and \svg@file@name as well as the compound of both is saved in \svg@file@base.

```

1188 \newif\if@svg@file@found
1189 \newcommand*\svg@file@path(){}
1190 \newcommand*\svg@file@name(){}
1191 \newcommand*\svg@file@base(){}
1192 \newcommand*\svg@file@suffix(){}
1193 \newcommand*\svg@get@path[3]{[\svg@file@ext]}{%
1194     \begingroup%
1195         \svg@filename@parse[\#1]{\#2}%
1196         \IfArgIsEmpty{\#1}{%
1197             \edef\svg@tempa{\filename@area\filename@base.\filename@ext}%
1198         }{%
1199             \edef\svg@tempa{\filename@area\filename@base.\#1}%
1200         }%
1201     }%

```

After calling \svg@set@input@path, all search paths are stored in \input@path, a single path given in the third argument will also be considered.

```
1201 \svg@set@input@path[\#3]]%
```

The specified file is searched with \IfFileExists. If the file search was succesful, the macro \svg@filename@parse is called with the result.

1227 }

```

B.5. Patches

\svg@patches
 \svg@picture@saved
 \svg@includegraphics@saved

For including the export results from *Inkscape* with L^AT_EX support enabled, there are some patches necessary for environment `picture` and `\includegraphics`. These patches are done with `\svg@patches`.

```

1228 \newcommand*\svg@picture@saved{}
1229 \let\svg@picture@saved\picture
1230 \newcommand*\svg@includegraphics@saved{}
1231 \let\svg@includegraphics@saved\includegraphics
1232 \newcommand*\svg@patches[1]{%
1233   \let\picture\svg@picture@patched%
1234   \let\includegraphics\svg@includegraphics@patched%
1235   \edef\svg@includegraphics@file{#1}%
1236 }

```

\svg@picture@patched
 \svg@picture@patched

In order to provide the possibility specify the desired width of a graphic, the appropriate `\unitlength` is calculated at the beginning of the `picture` environment.

```

1237 \newcommand*\svg@picture@patched{}
1238 \newcommand*\svg@picture@patched{%
1239 \long\def\svg@picture@patched#1{\svg@picture@patched@#1}%
1240 \def\svg@picture@patched@(#1,#2){%
1241   \svg@wrn@scale%

```

If a desired height is present, the resulting `\unitlength` is calculated with the ratio of the coordinates of the `picture` environment given as arguments for x- and y-direction by using `\Gscale@div`. With this factor, `\unitlength`—which is connected to the x-coordinate—can be scaled in a suitable manner.

```

1242 \ifdim\svg@param@height>\z@\relax%
1243   \Gscale@div\svg@tempa{#1\p@}{#2\p@}%
1244   \setlength\unitlength{\svg@param@height}%
1245   \setlength\unitlength{\svg@tempa\unitlength}%
1246 \ifdim\svg@param@width>\z@\relax%
1247   \ifdim\unitlength>\svg@param@width\relax%
1248     \setlength\unitlength{\svg@param@width}%
1249   \fi%
1250 \fi%
1251 \else%

```

If no height is given, `\unitlength` can be set easily.

```

1252 \ifdim\svg@param@width>\z@\relax%
1253   \setlength\unitlength{\svg@param@width}%
1254 \else%
1255   \setlength\unitlength{\svg@param@scale\unitlength}%
1256 \fi%
1257 \fi%

```

After setting `\unitlength`, the `picture` environment can be called with its original definition.

```

1258 \svg@picture@saved(#1,#2)%
1259 }

```

\svg@includegraphics@patched The patch to \includegraphics is meant to dissolve the **Inkscape** bug concerning the inclusion of more PDF pages than actually are existing.
\svg@includegraphics@file

The given optional parameters to \includegraphics are processed and the counter `svg@param@currpage` is set to the value of a given `page`. The value of parameter `width` is ignored.

```
1260 \DefineFamily{SVGpatch}
1261 \DefineFamilyMember{SVGpatch}
1262 \newcounter{svg@param@currpage}
1263 \setcounter{svg@param@currpage}{\m@ne}
1264 \FamilyCounterKey{SVGpatch}{page}{svg@param@currpage}
1265 \DefineFamilyKey{SVGpatch}{width}{\FamilyKeyStateProcessed}
1266 \newcommand*\svg@includegraphics@file{}
1267 \newcommand*\svg@includegraphics@patched[2][]{%
1268   \FamilyOptions{SVGpatch}{#1}}%
```

If option `lastpage` was set to `false`, each page is included—even if it doesn't exist, which may cause errors.

```
1269 \ifnum\value{svg@param@lastpage}<\z@\relax%
1270   \FamilySetCounter{SVGpatch}{page}{svg@param@currpage}%
1271   \the\value{svg@param@lastpage}%
1272 }%
1273 \fi%
```

Only if counter `svg@param@lastpage` is smaller than `svg@param@currpage`, pages are included, where `svg@param@lastpage` was either given as a number with parameter `lastpage` or was automatically calculated with `\svg@get@lastpage`.

```
1274 \ifnum\value{svg@param@currpage}>\value{svg@param@lastpage}\relax\else%
```

A page is included with the original definition of \includegraphics. All optional parameters are passed.

```
1275   \svg@includegraphics@saved[#{1}]{\svg@includegraphics@file}%
1276 \fi%
1277 }
```

C. Extracting independent graphic files with **svg-extract**

C.1. Options

For package **svg-extract** the user-interface is extended. The following options can either be set with \svgsetup or be used as local optional parameters for \includesvg and \includeinkscape.

\svg@dummy@key If package **svg-extract** wasn't loaded, the following options are defined for package **svg** in order to raise a warning message. Primarily this is done for compatibility reasons.

```
1278 <*main>
1279 \DefineFamilyMember{.dummy}{SVG}
1280 \newcommand*\svg@dummy@key[2][]{%
1281   \@ifpackageloading{svg-extract}{}{%
1282     \IfArgIsEmpty{#1}{%
1283       \DefineFamilyKey{.dummy}{SVG}{#2}{%
1284         \PackageWarning{svg}{%
1285           The option key '#2' can only\MessageBreak%
1286           be used with package 'svg-extract', but\MessageBreak%
1287           you didn't load it%}
1288     }%
1289     \FamilyKeyStateProcessed%
1290   }%
```

```

1291      }%
1292      \DefineFamilyKey[.dummy]{SVG}{#2}[{#1}]{%
1293          \PackageWarning{svg}{%
1294              The option key '#2' can only\MessageBreak%
1295              be used with package 'svg-extract', but\MessageBreak%
1296              you didn't load it}%
1297      }%
1298      \FamilyKeyStateProcessed%
1299  }%
1300 }%

```

Before package **svg-extract** the given key #2 of family member .dummy is relaxed.

```

1301      \AfterPackage{svg-extract}{\RelaxFamilyKey[.dummy]{SVG}{#2}}%
1302  }%
1303 }%
1304 </main>

```

C.1.1. Controlling the extract process

extract (opt.) With option **extract** it can be controlled, if the extraction of independent graphic files should be done.

```

C.1.4. Options for the extraction of graphics

```

extractwidth (opt.)
  \svgx@param@width
extractheight (opt.)
  \svgx@param@width
extractdistort (opt.)
extractkeepaspectratio (opt.)
  \svgx@param@distort
extractscale (opt.)
  \svgx@param@scale

For graphic extraction, the given settings regarding the size for inclusion can be overwritten
with these options. Using relax as value leads to resetting an option as unset, regardless of
what was previously given. The value inherit means, that the actual option for including
is used for extraction as well. This is the default setting.

1857 <*main>

2072 \let\svghidepreambleend\relax
2073 </extract>

```

C.3. Auxiliary macros

\svg@extract The macro `\svg@extract` does the actual job of both extracting and converting independent graphic files. Since it is necessary to run it with `--shell-escape` enabled, the command raises a warning if it is not activated. Afterwards, the package is finished.

```

2074 <*main>
2075 \newcommand*\svg@extract[1]{}
2076 </main>
2077 <*extract>
2078 \ifnum\pdf@shellescape=\@ne\relax\else%
2079   \renewcommand*\svg@extract[1]{%
2080     \if@svgx@run%
2081       \begingroup%
2082         \edef\svg@tempa{\#1}%
2083         \svg@quotes@remove{\svg@tempa}%
2084         \PackageWarning{svg-extract}{%
2085           You didn't enable 'shell escape' (or 'write18')\MessageBreak%
2086           so it wasn't possible to run the extraction for\MessageBreak%
2087           file '\svg@tempa'\MessageBreak%
2088         }%
2089       \endgroup%
2090     \fi%
2091   }%
2092   \expandafter\endinput%
2093 \fi
2094 </extract>

```

```

\svgx@stream@in Both an input stream and an output stream are necessary for this as well as a token register,
\svgx@read@line which is used to store all commands which should be executed on shell.

\svgx@stream@out
\if@svgx@preamble@write 2095 \newread\svgx@stream@in
2096 \newcommand*\svgx@read@line{}%
2097 \newwrite\svgx@stream@out
2098 \newif\if@svgx@preamble@write

\svg@extract If flag --shell-escape is enabled, the command is defined with its intended functionality.
It runs all necessary processes to extract and convert graphic files.

2099 \renewcommand*\svg@extract[1]{%
If option extract is enabled...
2100 \if@svgx@run% ...

...the macro \svgx@get@out@sec is used to get the current level numbering within the
document and the counter for extracted graphics is stepped. After that, a separate auxiliary
LATEX file is created for extracting independent graphic files. The macro \svgx@get@out@sec
is used to get the current level numbering within the document. The specified preamble is
read for this task, if it exists. It is first searched in the same folder as the SVG file and if it
wasn't found, in any other valid folder for SVG files.

C.4. Commands for the separate auxiliary L^AT_EX-file

For the extraction of independent graphics, an auxiliary L^AT_EX file is needed. Within this file, the following commands are used to include the desired graphic.

\svgxsetbox Within the preamble of the auxiliary L^AT_EX file, the desired graphic is used to setup a box, which is used both to define the papersize as well as for the output itself. The macro \svgx@setbox is executed twice, the first time in the preamble and the second time at the very end of \AtBeginDocument if package **etoolbox** was loaded.

The switch \if@svgx@standalone is defined for enabling classes to implement a different behaviour for **svg-extract** in standalone mode. for example, TUD-Script-classes are using this switch.

```

2520 \newif\if@svgx@standalone
2521 \newcommand*\svgxsetbox[2][]{%
2522   \if@svgx@standalone true%
2523   \svgx@setbox{\#1}{\#2}%
2524   \scr@ifundefinedorrelax{AtEndPreamble}{%
2525     \let\svg@tempa@\firstofone%
2526   }{%
2527     \def\svg@tempa{\AtEndPreamble}%
2528   }%
2529   \svg@tempa{\AtBeginDocument{\svgx@setbox{\#1}{\#2}}}}%
2530 }
2531 \newcommand*\svgx@setbox[2]{%
2532   \sbox\svg@box{\svg@input[\#1,draft=false]{\#2}}%
2533   \svgxsetpapersize%
2534 }

```

\svgxsetpapersize This macro sets all well known length macros for defining the paper size as well as the type area to the size of \svg@box.

```

2535 \newcommand*\svgxsetpapersize{%
2536   \setlength\paperwidth{\the\wd\svg@box}%

```

Due to the fact, that the lengths for stock- and mediasizes are maybe set to \relax, these macros are checked with \scr@ifundefinedorrelax.

```

2537 \scr@ifundefinedorrelax{stockwidth}{}{%
2538   \setlength\stockwidth{\paperwidth}%
2539 }%
2540 \scr@ifundefinedorrelax{mediawidth}{}{%
2541   \setlength\mediawidth{\paperwidth}%
2542 }%
2543 \setlength\textwidth{\paperwidth}%
2544 \setlength\paperheight{\dimexpr\ht\svg@box+\dp\svg@box\relax}%
2545 \scr@ifundefinedorrelax{stockheight}{}{%
2546   \setlength\stockheight{\paperheight}%
2547 }%
2548 \scr@ifundefinedorrelax{mediaheight}{}{%
2549   \setlength\mediaheight{\paperheight}%
2550 }%
2551 \setlength\textheight{\paperheight}%

```

Any other length regarding the layout is set to have no influence at all. Hence the document has the same size as the graphic.

```

2552   \hoffset=-1in%
2553   \oddsidemargin=\z@%
2554   \evensidemargin=\z@%
2555   \voffset=-1in%
2556   \topmargin=\z@%
2557   \headheight=\z@%
2558   \headsep=\z@%
2559   \topskip=\z@%
2560   \footskip=\z@%
2561   \marginparsep=\z@%
2562   \marginparwidth=\z@%
2563   \marginparpush=\z@%
2564 }
2565 \onlypreamble\svgxsetpapersize

```

<pre>\svgxoutputbox \if@svgx@beamer 2566 \newif\if@svgx@beamer 2567 \@ifclassloaded{beamer}{\@svgx@beamertrue}{}% 2568 \newcommand*\svgxoutputbox{% 2569 \begingroup% 2570 \setlength\parindent{\z@}% 2571 \setlength\parskip{\z@}% 2572 \setlength\parfillskip{\z@}% 2573 \if@svgx@beamer% 2574 \setbeamertemplate{navigation symbols}{}% 2575 \begin{frame}[plain]% 2576 \usebox\svg@box% 2577 \end{frame}% 2578 \else% 2579 \usebox\svg@box% 2580 \fi% 2581 \endgraf% 2582 \endgroup% 2583 }</pre>	<p>With <code>\svgxoutputbox</code> the created box is displayed.</p>

Change History

v1.0		
General		
initial version by Philip Ilten	2	547
v2.00		
General		
new maintainer: Falk Hanisch	2	395
package subfig not required anymore . . .	2	522
re-implementation from scratch	2	633
support of subfigures stopped due to the huge number of packages which deal with this topic and the large variety of implementing this functionality; naming exported graphics after their consecutive numbering can't be ensured for all variants of subfigures, so it's neglected	2	1817
Implementation		
clean (opt.): changes, file list possible	1989	1817

v2.00a		
Implementation		
\svgxsetpapersize : Bug fix for checking stock- and mediasizes . . .		2535
v2.00b		
Implementation		
latex (opt.): new, alternative key for inkscape latex	456	v2.00b
tex (opt.): new, alternative key for inkscape latex	456	
v2.01		
General		
option svgextension added in order to change the format of files exported by Inkscape from svg to a custom one	6	option svgextension added in order to change the format of files exported by Inkscape from svg to a custom one
usage of \input{<tex filename>} within Inkscape graphics locates files in all declared searched folders		6
Implementation		
\includesvg :		
svgextension (param.): new	710	710
inkscape (opt.): using \trim@spaces .		313

\svg@append@input@path: new	1147
\svg@get@path:	
using \svg@set@input@path	1188
using \trim@spaces	1188
\svg@set@input@path: new	1147
svgextension (opt.): new due to user request	515
v2.02	
General	
fixed errors with active double quotes from babel in path arguments	2
multiple dots within file names possible	2
option distort (or keepaspectratio)	
added for distortion of included graphics	6
option extractdistort added for distortion of extracted graphics	9
package trimspaces required	2
parameter extractangle for \includesvg and \includeinkscape implemented in order to rotate graphics during extractions	10
Implementation	
distort (opt.): new	553
extractdistort (opt.): new	1857
extractname (opt.): usage of \svg@quotes@remove	1817
extractpath (opt.): usage of \svg@sanitize@dq	1783
\if@svgx@standalone: new	2520
\includeinkscape:	
usage of \svg@extension@parse	759
extractangle (param.): new	2032
extractdistort (param.): new	2032
\includesvg:	
switched to \svg@filename@parse	707
angle (param.): validation of argument	742
distort (param.): new	710
extractangle (param.): new	2032
extractdistort (param.): new	2032
inkscape (opt.): usage of \svg@sanitize@dq	313
inkscapepath (opt.): usage of \svg@sanitize@dq	522
keepaspectratio (opt.): new	553
\svg@append@input@path: avoid duplicates in \input@path	1147
\svg@deactivate@dq: new	46
\svg@extension@parse: new	143
\svg@extension@@parse: new	143
\svg@file@missing: notify svg file when missing exported files	1034
\svg@filename@parse:	
usage of \svg@extension@parse	106
usage of \svg@remove@leadingchar	106
usage of \svg@sanitize@dq	106
\svg@local@param@set: reasonable value for key distort	653
\svg@normalize@path: usage of \svg@deactivate@dq	238
\svg@quotes@remove:	
calling \svg@quotes@check	65
usage of \svg@sanitize@dq	65
\svg@remove@leadingchar: new	90
v2.02a	
General	
fix bug for package polyglossia which fakes babel poorly	2
Implementation	
\svg@deactivate@dq: bug fix for polyglossia	46
v2.02b	
General	
fix bug for package tikzscale which changes \includegraphics globally	2
Implementation	
\svg@patches: fix bug for package tikzscale : store original definitions of \picture and \includegraphics right after loading package svg	1228
v2.02c	
General	
fix bugs with kernel (2019/10/01) regarding file name parsing	2
v2.02d	
General	
conditional invocation of Inkscape export based on file modification date implemented for Xe ^T EX	2
fix bugs with kernel (2019/10/01) regarding file name parsing, see https://github.com/mrpiggi/svg/issues/16	2
Implementation	
\svg@iffilenewer: use \filemoddate with Xe ^T EX, see https://github.com/mrpiggi/svg/issues/12	179
v2.02f	
General	
command line interface of Inkscape 1.0 is supported	2
option inkscapeversion for explicitly setting Inkscape -CLI version; automatic detection implemented	5
Implementation	
\if@svg@ink@ver@detect: new	1080
inkscapeexe (opt.): only usable in preamble	395
inkscapeversion (opt.): new	395
\svg@ink@cmd: distinguish Inkscape CLI versions	491
\svg@ink@ver: new	395
\svg@ink@ver@detect: new	1080
