The somedefs toolkit package

Alan Jeffrey

long time ago in a different century...

Overview

This is an example 'programmers toolkit' package, for use by package writers. It allows package writers to provide options which switch definitions on and off. For example, a package **fred** might define a large number of commands, including **foo** and **baz**, so:

\usepackage{fred}

would use a lot of memory, even if \foo and \baz were the only commands needed. However, if the author of fred used the somedefs package, then the user would be able to say:

```
\usepackage[only,foo,baz]{fred}
```

and only the commands \foo and \baz would be defined.

To use the somedefs package in your own packages or classes, you say:

```
\RequirePackage{somedefs}
```

You can then use four new commands:

- \UseAllDefinitions which says that all the commands in the file should be defined.
- \UseSomeDefinitions which says that only the commands specified by \UseDefinition should be defined.
- \ProvidesDefinition{\definition\} which provides one definition, of the form \definingcommand{\command}...

For example, the package **fred** could say:

```
\RequirePackage{somedefs}
\UseAllDefinitions
\DeclareOption{only}{\UseSomeDefinitions}
\DeclareOption*{\UseDefinition{\CurrentOption}}
\ProcessOptions
\ProvidesDefinition{\newcommand{\foo}{...}}
\ProvidesDefinition{\newcommand{\baz}{...}}
```

One of the commands **\UseAllDefinitions** or **\UseSomeDefinitions** should always be used. You may have some commands which need other commands, in which case you have to declare the options by hand. For example, if the command **\bar** needs the command **\foo**, you could say:

\DeclareOption{bar}{\UseDefinition{bar}\UseDefinition{foo}}

For a longer example of the use of the somedefs package, look at the rawfonts package.

Implementation

The driver for the documentation you're now reading.

```
1 \langle * driver \rangle
                          2 \documentclass{ltxdoc}
                          3 \begin{document}
                          4 \DocInput{somedefs.dtx}
                          5 \ \ \
                          6 (/driver)
                         This is a LATEX 2_{\varepsilon} package.
                          7 (*package)
                          8 \NeedsTeXFormat{LaTeX2e}
                          9 \ProvidesPackage{somedefs}[1994/06/01 v0.03 Toolkit for optional definitions]
                         The package works by having UseDefinition{(name)} define \neme to be
    \UseSomeDefinitions
                         \Cunprovided@definition. If \UseSomeDefinitions has been called, then
     \UseAllDefinitions
         \UseDefinition
                         \ProvidesDefinition looks to see if \name is \@unprovided@definition. If
    \ProvidesDefinition
                         \UseAllDefinitions has been called, then \ProvidesDefinition does nothing.
                         If neither has been called, then \ProvidesDefinition produces an error message.
   \@providesdefinition
  \@provides@definition
                         10 \def\UseSomeDefinitions{%
\@unprovided@definition
                         11
                              \let\ProvidesDefinition\@providesdefinition
                         12 }
                         13 \def\UseAllDefinitions{%
                         14
                              \let\ProvidesDefinition\@firstofone
                         15 }
                         16 \def\UseDefinition#1{%
                              \expandafter\let\csname#1\endcsname\@unprovided@definition
                         17
                         18 }
                         19 \def\ProvidesDefinition#1{%
                              \PackageError{somedefs}%
                         20
                                {No \noexpand\UseSomeDefinitions or \string\UseAllDefinitions}%
                         21
                                {The package which used the `somedefs' package has an error.}%
                         22
                         23 }
                         25
                              \@provides@definition}
                         26 \def\@provides@definition#1#2#3\@provides@definition{%
                         27
                              \ifx#2\@unprovided@definition
                                 #1#2#3%
                         28
                              \fi
                         29
                         30 }
                         31 \def\@unprovided@definition{%
                         32
                              \PackageError{somedefs}%
                         33
                                {Package `somedefs' error: this command was never defined}%
                                {You have requested a command which does not exist.}%
                         34
                         35 }
                         36 \Conlypreamble\UseSomeDefinitions
                         37 \Conlypreamble\UseAllDefinitions
                         38 \Conlypreamble\UseDefinition
                         39 \Conlypreamble\ProvidesDefinition
                         40 \Conlypreamble \Cprovidesdefinition
                         41 \Conlypreamble\CprovidesCdefinition
                         That's it!
                         42 \langle / package \rangle
