1 unravel documentation

The aim of this L^AT_EX package is to help debug complicated macros. This is done by letting the user step through the execution of some T_EX code, going through the details of nested expansions, performing assignments, as well as some simple typesetting commands. To use this package, one should normally run T_EX in a terminal.

\unravel [*key-value list*] {*code*}

This command shows in the terminal the steps performed by T_EX when running the *code*. By default, it pauses to let the user read the description of every step: simply press <return> to proceed. Typing **s**{*integer*} instead will go forward *integer* steps somewhat silently. In the future it will be possible to use a negative *integer* to go back a few steps. Typing **h** gives a list of various other possibilities. The available *key-value* options are described in Section 1.1.

\unravelsetup {*options*}

Sets *options* that apply to all subsequent \unravel. See options in Section 1.1.

\unravel:nn {*options*} {*code*}

See \unravel.

\unravel_setup:n {*options*}

See \unravelsetup.

The **unravel** package is currently based on the behaviour of pdfT_EX, but it should work in all engines supported by expl3 (pdfT_EX, X_ET_EX, LuaT_EX, epT_EX, eupT_EX) as long as none of the primitives specific to those engines is used. Any difference between how **unravel** and (pdf)T_EX process a given piece of code, unless described in the

section 1.2, should be reported on the issue tracker (<https://github.com/blefloch/latex-unravel/issues>).

As a simple example, one can run L^AT_EX on the following file.

```
\documentclass{article}
\usepackage{unravel}
\unravel
{
    \title{My title}
    \author{Me}
    \date{\today}
}
\begin{document}
\maketitle
\end{document}
```

A more elaborate example is to understand how `\newcommand` works.

```
\documentclass{article}
\usepackage{unravel}
\begin{document}
\unravel
{
    \newcommand*{\foo}[1]{bar(#1)}
    \foo{3}
}
\end{document}
```

The `unravel` package understands deeply nested expansions as can be seen for instance by unravelling functions from `l3fp`, such as with the following code (given the current default settings, this code runs for roughly 2000 steps: you can type `s1980` as a response to the prompt, then press “enter” a few times to see the last few steps of expansion).

```
\documentclass{article}
\usepackage{unravel}
\begin{document}
\ExplSyntaxOn
\unravel { \fp_eval:n { 3.45 * 2 pi } }
\ExplSyntaxOff
\end{document}
```

Given all the work that `unravel` has to do to emulate T_EX, it is not fast on very large pieces of code. For instance, running it on `\documentclass{article}` takes about one minute on my machine, and finishes after somewhat less than 21000 steps.

```
\RequirePackage{unravel}
\unravel{\documentclass{article}\relax}
\usepackage{lipsum}
\begin{document}
\lipsum
\end{document}
```

The `\relax` command is needed after `\documentclass{article}` because this command tries to look for an optional argument: `\unravel` would not find any token, and would give up, as `TeX` would if your file ended just after `\documentclass{article}`. After running the above through `pdfTeX`, one can check that the result is identical to that without `unravel`. Note that `\unravel{\usepackage{lipsum}\relax}`, despite taking as many steps to complete, is much slower, because `\newcommand` uses delimited arguments, which prevent some optimizations that `unravel` can otherwise obtain. For comparison, `\unravel{\lipsum[1-30]}` also takes 20000 step.

1.1 Options

<code>explicit-prompt</code>	Boolean option (default <code>false</code>) determining whether to give an explicit prompt. If <code>true</code> , the text “Your input=” will appear at the beginning of lines where user input is expected.
<code>internal-debug</code>	Boolean option (default <code>false</code>) used to debug <code>unravel</code> itself.
<code>machine</code>	Option which takes no value and makes <code>unravel</code> produce an output that is somewhat more suitable for automatic processing. In particular, it sets <code>max-action</code> , <code>max-output</code> , <code>max-input</code> to very large values, and <code>number-steps</code> to <code>false</code> .
<code>max-action</code> <code>max-output</code> <code>max-input</code>	Integer options (defaults 50, 300, 300) determining the maximum number of characters displayed for the action, the output part, and the input part.
<code>number-steps</code>	Boolean option (default <code>true</code>) determining whether to number steps.
<code>welcome-message</code>	Boolean option (default <code>true</code>) determining whether to display the welcome message.

1.2 Differences between `unravel` and `TeX`’s processing

Bugs are listed at <https://github.com/blefloch/latex-unravel/issues>.

Differences.

- Some primitives are not implemented yet: alignments (`\halign`, `\valign`, `\noalign`, `\omit`, `\span`, `\cr`, `\crcr`, `\&`), many math mode primitives, and `\pdfprimitive`, `\discretionary`, as well as all primitives specific to engines other than `pdfTeX`. This list may sadly be incomplete!
- `\aftergroup` is only partially implemented.
- `\everyhbox`, `\everyvbox`, `\everymath`, `\everydisplay`, `\lastkern`, `\lastnodeltype`, `\lastpenalty`, `\lastskip`, `\currentiflevel` and `\currentifttype` may have wrong values. Perhaps `\currentgrouplevel` and `\currentgroupype` too.
- Tokens passed to `\afterassignment` are not yet kept after `unravel` is done even if there has been no assignment.
- Tokens passed to `\aftergroup` are lost when `unravel` is done.

- In X_ET_EX, characters beyond the basic multilingual plane may break `unravel` (not tested).
- For `unravel`, category codes are fixed when a file is read using `\input`, while T_EX only fixes category codes when the corresponding characters are converted to tokens. Similarly, the argument of `\scantokens` is converted to the new category code régime in one go, and the result must be balanced.
- Explicit begin-group and end-group characters other than the usual left and right braces may make `unravel` choke, or may be silently replaced by the usual left and right braces.
- `\endinput` is ignored with a warning, as it is very difficult to implement it in a way similar to T_EX's, and as it is most often used at the very end of files, in a redundant way.
- `\outer` is not supported.

1.3 Future perhaps

- Allow users to change some settings globally/for one `\unravel`.
- Allow to replay steps that have already been run.
- Fix the display for `\if` and `\ifcat` (remove extraneous `\exp_not:N`).
- Use the `file-error` fatal error message: first implement `\@@_file_if_exist:nTF` and use it to determine whether `\input` will throw a fatal error in `\batchmode` and `\nonstopmode`.
- Use the `interwoven-preambles` fatal error message once alignments are implemented.
- Look at all places where T_EX's procedure `prepare_mag` is called.
- Find out why so many input levels are used (see the log of the `unravel003` testfile for instance)

2 `unravel` implementation

Some support packages are loaded first, then we declare the package's name, date, version, and purpose.

```

1  {*package}
2  (@@=unravel)

```

Catcode settings. In a group, set `\c` to be a synonym of `\catcode` for short, set the catcode of space to be 10 (using `\fam` to avoid needing a space or an equal sign to separate the two integer arguments of `\catcode`) and that of % to be 14 (using `\fam` again to avoid needing the digit 7 to have catcode other: we need the digit 5 anyway in two steps). Then make -, 6, 7, 8, 9 other (we must assume that 0 through 5 are already other), and make :, _, h, j, k, q, s, w, x, y, z letters (other lowercase letters already need to be letters in the rest of the code). Make sure there is no `\endlinechar`. We are finally ready to safely test whether the package has already been loaded and bail out in case it

has. Expanding `\fi` before ending the group ensures that the whole line has been read by TeX before restoring earlier catcodes.

```

3 \begingroup\let\c\catcode\fam32\c\fam10\advance\fam5\c\fam14\c45 12 %
4 \c54 12\c55 12\c56 12\c57 12\c58 11\c95 11\c104 11\c106 11\c107 11 %

6 \expandafter\ifx\csname unravel\endcsname\relax
7 \else\endinput\expandafter\endgroup\fi

```

Set T and X to be letters for an error message. Set up braces and # for definitions, = for nicer character code assignments, > for integer comparison, + for integer expressions.

```

8 \c84 11\c88 11\c35 6\c123 1\c125 2\c62 12\c61 12\c43 12 %

```

If ε-TEx’s `\numexpr` or `\protected` are not available, bail out with an error.

```

9 \expandafter\ifx\csname numexpr\endcsname\relax
10 \errmessage{unravel requires \numexpr from eTeX}
11 \endinput\expandafter\endgroup\fi
12 \expandafter\ifx\csname protected\endcsname\relax
13 \errmessage{unravel requires \protected from eTeX}
14 \endinput\expandafter\endgroup\fi

```

If `unravel` is loaded within a group, bail out because `expl3` would not be loaded properly.

```

15 \expandafter\ifx\csname currentgrouplevel\endcsname\relax\else
16 \ifnum\currentgrouplevel>1 \errmessage{unravel loaded in a group}
17 \endinput\expandafter\expandafter\expandafter\endgroup\fi\fi

```

Make spaces ignored and make ~ a space, to prettify code.

```

```

`\l__unravel_setup_restore_tl` This token list variable will contain code to restore category codes to their value when the package was loaded.

```

20 \gdef \l__unravel_setup_restore_tl { }

```

(End definition for `\l__unravel_setup_restore_tl`.)

`__unravel_setup_restore:` Use the token list to restore catcodes to their former values, then empty the list since there is no catcode to restore anymore. This mechanism cannot be nested.

```

21 \protected \gdef \__unravel_setup_restore:
22 {
23     \l__unravel_setup_restore_tl
24     \def \l__unravel_setup_restore_tl { }
25 }

```

(End definition for `__unravel_setup_restore`.)

`__unravel_setup_save:` This saves into `\l__unravel_setup_restore_tl` the current catcodes (from 0 to 255 only), `\endlinechar`, `\escapechar`, `\newlinechar`.

```

26 \protected \gdef \__unravel_setup_save:
27 {
28     \edef \l__unravel_setup_restore_tl
29     {
30         \__unravel_setup_save_aux:w 0 =
31         \endlinechar = \the \endlinechar
32         \escapechar = \the \escapechar

```

43   \fi
44 }
```

(End definition for `__unravel_setup_save:` and `__unravel_setup_aux:n.`)

`__unravel_setup_catcodes:nnn` This sets all characters from #1 to #2 (inclusive) to have catcode #3.

```

45 \protected \long \gdef \__unravel_setup_catcodes:nnn #1 #2 #3
46 {
47   \ifnum #1 > #2 ~ \else

50     { \the \numexpr #1 + 1 } {#2} {#3}
51   \fi
52 }
```

(End definition for `__unravel_setup_catcodes:nnn.`)

`__unravel_setup_latexe:` This saves the catcodes and related parameters, then sets them to the value they normally have in a L^AT_EX 2_E package (in particular, @ is a letter).

```

End the group where all catcodes were changed, but expand `__unravel_setup_latexe`: to sanitize catcodes again outside the group. The catcodes are saved.

127 `\expandafter \endgroup __unravel_setup_latexe`:

Load a few dependencies: `expl3`, `xparse`, `gtl`. Load `l3str` if `expl3` is too old and does not define `\str_range:nnn`. Otherwise loading `l3str` would give an error.

128 `\RequirePackage{expl3,xparse}[2018/02/21]`

129 `\RequirePackage{gtl}[2018/04/04]`

130 `\csname cs_if_exist:cF\endcsname{str_range:nnn}{\RequirePackage{l3str}}`

Before loading `unravel`, restore catcodes, so that the implicit `\ExplSyntaxOn` in `\ProvidesExplPackage` picks up the correct catcodes to restore when `\ExplSyntaxOff` is run at the end of the package. The place where catcodes are restored are beyond `unravel`'s reach, which is why we cannot bypass `expl3` and simply restore the catcodes once everything is done. To avoid issues with crazy catcodes, make TeX read the arguments of `\ProvidesExplPackage` before restoring catcodes. Then immediately go to the catcodes we want.

2.1 Primitives, variants, and helpers

2.1.1 Renamed primitives

Copy primitives which are used multiple times, to avoid littering the code with `:D` commands. Primitives are left as `:D` in the code when that is clearer (typically when testing the meaning of a token against that of a primitive).

138 `\cs_new_eq:NN __unravel_currentgroupype: \etex_currentgroupype:D`

147 `\cs_new_eq:NN __unravel_number:w \tex_number:D`

(End definition for `__unravel_currentgroupype:` and others.)

These are not quite primitives, but are very low-level `ior` streams to prompt the user explicitly or not.

`__unravel_tl_first_int:N` Function that finds an explicit number in a token list. This is used for instance when implementing `\read`, to find the stream $\langle\text{number}\rangle$ within the whole `\read \langle\text{number}\rangle \to \langle cs\rangle` construction. The auxiliary initially has itself as a first argument, and once a first digit is found it has `\use_none_delimit_by_q_stop:w`. That first argument is used whenever what follows is not a digit, hence initially we loop, while after the first digit is found any non-digit stops the recursion. If no integer is found, 0 is left in the token list. The surrounding `\int_eval:n` lets us dump digits in the input stream while keeping the function fully expandable.

2.1.4 String helpers

`__unravel_strip_escape:w`
`__unravel_strip_escape_aux:N`
`__unravel_strip_escape_aux:w`

This is based on the 2013-07-19 (and earlier) version of `\cs_to_str:N`. There are three cases. If the escape character is printable, the charcode test is false, and `__unravel_strip_escape_aux:N` removes one character. If the escape character is a space, the charcode test is true, and if there is no escape character, the test is unfinished after `\token_to_str:N \`. In both of those cases, `__unravel_strip_escape_aux:w` inserts `-\@@_number:w \fi: \c_zero`. If the escape character was a space, the test was true, and `\int_value:w` converts `\c_zero` to 0, hence the leading roman numeral expansion removes a space from what follows (it is important that what follows cannot start with a digit). Otherwise, the test takes - as its second operand, is false, and the roman numeral expansion only sees `\c_zero`, thus does not remove anything from what follows.

```

`_unravel_token_if_expandable:p:N`
`_unravel_token_if_expandable:NTF` We need to cook up our own version of `\token_if_expandable:NTF` because the `expl3` one does not think that `undefined` is expandable.

330 }
```

(End definition for `_unravel_token_if_expandable:NTF`.)

`_unravel_token_if_protected:p:N` Returns `true` if the token is either not expandable or is a protected macro.

```
331 \prg_new_conditional:Npnn \_unravel_token_if_protected:N #1

340         { \prg_return_true: }
341         { \prg_return_false: }
342       }
343     }
344   { \prg_return_true: }
345 }
```

(End definition for `_unravel_token_if_protected:NTF`.)

`_unravel_token_if_definable:NTF` Within a group, set the escape character to a non-space value (backslash). Convert the token to a string with `\token_to_str:N`. The result is multiple characters if the token is a control sequence, and a single character otherwise (even for explicit catcode 6 character tokens which would be doubled if we used `\tl_to_str:n` instead of `\token_to_str:N`). Thus `\str_tail:n` gives a non-empty result exactly for control sequences. Those are definable (technically, not always: `\expandafter\font\csname\endcsname=cmr10\expandafter\def\the\csname\endcsname{}`). For characters, there remains to determine if `#1` is an active character. One option would be to build the active character with that character code and compare them using a delimited-argument test, but that needlessly pollutes the hash table in X_ET_EX (and L_UaT_EX?) if the character was in fact not active. Instead, use the `\lowercase` primitive to convert the character to a fixed character code Z. Compare with an active Z. In all cases, remember to end the group.

```

2.2.2 Working with tokens

```
\g__unravel_input_int
```

The user input, at each stage of expansion, is stored in multiple gtl variables, from `\g@@_input_{\langle n \rangle}_gtl` to `\g__unravel_input_1_gtl`. The split between variables is akin to TeX's input stack, and allows us to manipulate smaller token lists, speeding up processing. The total number $\langle n \rangle$ of lists is `\g__unravel_input_int`. The highest numbered gtl represents input that comes to the left of lower numbered ones.

```
477 \int_new:N \g__unravel_input_int

```

(End definition for `\g__unravel_input_tma_int` and `\l__unravel_input_tma_tl`.)

```
\g__unravel_prev_input_seq
```

The different levels of expansion are stored in `\g__unravel_prev_input_seq`, with the innermost at the end of the sequence (otherwise the sequence would have to be reversed for display). When adding material to the last level of expansion, `\l__unravel_prev_input_tl` or `\l__unravel_prev_input_gtl` are used to temporarily store the last level of expansion.

```

```

\l__unravel_defined_tl \l__unravel_defining_tl The token that is defined by the prefixed command (such as \chardef or \futurelet), and the code to define it. We do not use the previous-input sequence to store that code: rather, this sequence contains a string representation of the code, which is not suitable for the definition. This is safe, as definitions cannot be nested. This is needed for expanding assignments, as expansion should be shown to the user, but then later should not be performed again when defining.

2.2.6 \TeX parameters

\g_unravel_mag_set_int The first time \TeX uses the value of `\mag`, it stores it in a global parameter `mag_set` (initially 0 to denote not being set). Any time \TeX needs the value of `\mag`, it checks that the value matches `mag_set`. This is done in `unravel` by `_unravel_prepare_mag`:, storing `mag_set` in `\g_unravel_mag_set_int`.

So far we've implemented properly [71,104]; [107,113].

A few minor differences with pdfTEX's internal numbers are as follows.

- `case_shift` is shifted by 3983.
- `assign_toks` is shifted by `local_base=3412`.
- `assign_int` is shifted by `int_base=5263`.
- `assign_dimen` is shifted by `dimen_base=5830`.
- `assign_glue` and `assign_mu_glue` are shifted by `glue_base=2882`.
- `set_shape` is shifted (in ε -TEX) by `local_base`.
- `def_code` and `def_family` is shifted by `cat_code_base=3983`.
- In TEX, `inputlineno.char=3` and `badness.char=4`.

2.4 Get next token

We define here two functions which fetch the next token in the token list.

- `__unravel_get_next`: sets `\l__unravel_head_gtl`, `\l__unravel_head_token`, and if possible `\l__unravel_head_tl` (otherwise it is cleared).
- `__unravel_get_token`: additionally sets `\l__unravel_head_cmd_int` and `\l__unravel_head_char_int`.

The latter is based on `__unravel_set_cmd`: which derives the `\l__unravel_head_cmd_int` and `\l__unravel_head_char_int` from `\l__unravel_head_token`.

If the input is empty, forcefully exit. Otherwise, remove the first token in the input, and store it in `\l__unravel_head_gtl`. Set `\l__unravel_head_token` equal in meaning to that first token. Then set `\l__unravel_head_tl` to contain the token, unless it is a begin-group or end-group character, in which case this token list is emptied.

```

First set `\l__unravel_head_meaning_t1` from the `\meaning` of the first token. If the corresponding primitive exists, use the information to set the two integers. If the token is expandable, it can either be a macro or be a primitive that we somehow do not know (e.g., an expandable X_ET_EX or L_auT_EX primitive perhaps). Otherwise, it can be a control sequence or a character.

The details of how TeX looks for keywords are quite tricky to get right, in particular with respect to expansion, case-insensitivity, and spaces. We get rid of the case issue by requiring the keyword to be given in both cases, intertwined: for instance, `__unravel_scan_keyword:n { pPtT }`. Then loop through pairs of letters (which should be matching lowercase and uppercase letters). The looping auxiliary takes three arguments, the first of which is a boolean, `true` if spaces are allowed (no letter of the keyword has been found yet). At each iteration, get a token, with expansion, and test whether it is a non-active character equal (in character code) to either letter of the pair: this happens if the token is not “definable” (neither a control sequence nor an active character) and it has the right string representation... well, it could also be doubled (macro parameter character), hence we look at the first character only; spaces become an empty string, but this works out because no keyword contains a space. So, at each iteration, if the token is the correct non-active character, add it to the previous-input sequence (as a generalized token list since keywords may match begin-group or end-group characters), and otherwise break with `__unravel_scan_keyword_false:w`, unless we are still at the beginning of the keyword and the token is a space. When the loop reaches the end of the keyword letter pairs, complain if there were an odd number of letters, and otherwise conclude the loop with `__unravel_scan_keyword_true:`, which stores the keyword, converted to a string. Note that TeX’s skipping of leading spaces here must be intertwined with the search for keyword, as is shown by the (plain TeX) example

```
\lccode32='f \lowercase{\def\fspace{ } }
\skip0=1pt plus 1 \fspace \relax
\message{\the\skip0} % => 1pt plus 1fil

`__unravel_scan_something_internal:n` Receives an (explicit) “level” argument:

- `int_val=0` for integer values;
- `dimen_val=1` for dimension values;
- `glue_val=2` for glue specifications;
- `mu_val=3` for math glue specifications;
- `ident_val=4` for font identifiers (this never happens);
- `tok_val=5` for token lists (after `\the` or `\showthe`).

Scans something internal, and places its value, converted to the given level, to the right of the last item of the previous-input sequence, then sets `\g__unravel_val_level_int` to the found level (level before conversion, so this may be higher than requested).

From `__unravel_thing_case::`, get the information about what level is produced by the given token once it has received all its operands (head of `\l__unravel_tmpa_t1`), and about what to do to find those operands (tail of `\l__unravel_tmpa_t1`). If the first token may not appear after `\the` at all, `__unravel_thing_case::` gives level 8.

If the argument (#3 in the auxiliary) is < 4 but the level that will be produced (#1 in the auxiliary) is ≥ 4 (that is, 4, 5, or 8) complain about a missing number and insert a zero dimension, to get exactly TeX’s error recovery. If the level produced is 8, complain that `\the` cannot do this.

Otherwise, scan the arguments (in a new input level). If both the argument and the level produced are < 4 , then get the value with `__unravel_thing_use_get:nnNN` which downgrades from glue to dimension to integer and produces the `incompatible-units` error if needed. The only remaining case is that the argument is 5 (since 4 is never used) and the level produced is that or less: then the value found is used with `__unravel_the:w`.

Finally, tell the user the tokens that have been found (if there was a single token, its meaning as well) and their value. Use `=>` rather than `=` because the value displayed is the value used, not the actual value (this matters in constructions such as `\parindent=\parskip` where a skip or a dimen is downgraded to a dimen or an int, or when there was an error).

This expands to a digit (the level generated by whatever token is the current `head`), followed by some code to fetch necessary operands. In most cases, this can be done by simply looking at the `cmd` integer, but for `last_item`, `set_aux` and `register`, the level of the token depends on the `char` integer. When the token is not allowed after `\the` (or at any other position where `__unravel_scan_something_internal:n` is called), the resulting level is 8, large enough so that the main function knows it is forbidden.

`__unravel_scan_dimen:nN`

The first argument is 2 if the unit may not be `mu` and 3 if the unit must be `mu` (or `fil`). The second argument is `\c_true_bool` if `fil`, `fill`, `filll` are permitted, and is otherwise `false`. These arguments are similar to those of TeX's own `scan_dimen` procedure, in which `mu` is `bool(#1=3)` and `inf` is `#2`. The third argument of this procedure is omitted here, as the corresponding shortcut is provided as a separate function, `__unravel_scan_dim_unit:nN`.

2.8 Working with boxes

__unravel_do_box:N When this procedure is called, the last item in the previous-input sequence is

- empty if the box is meant to be put in the input stream,

- `\setbox<int>` if it is meant to be stored somewhere,
- `\moveright<dim>`, `\moveleft<dim>`, `\lower<dim>`, `\raise<dim>` if it is meant to be shifted,
- `\leaders` or `\cleaders` or `\xleaders`, in which case the argument is `\c_true_bool` (otherwise `\c_false_bool`).

If a `make_box` command follows, we fetch the operands. If leaders are followed by a rule, then this is also ok. In all other cases, call `_unravel_do_box_error:` to clean up.

```

`_unravel_do_box_error:` Put the (non-`make_box`) command back into the input and complain. Then recover by throwing away the action (last item of the previous-input sequence). For some reason (this appears to be what TeX does), there is no need to remove the after assignment token here.

`_unravel_do_begin_box:N` We have just found a `make_box` command and placed it into the last item of the previous-input sequence. If it is “simple” (`\box<int>`, `\copy<int>`, `\lastbox`, `\vsplit<int> to <dim>`) then we grab its operands, then call `_unravel_do_simple_box:N` to finish up. If it is `\vtop` or `\vbox` or `\hbox`, we need to work harder.

`_unravel_do_box_explicit:N`

At this point, the last item in the previous-input sequence is typically `\setbox0\hbox` or `\raise 3pt\hbox`. Scan for keywords `to` and `spread` and a left brace. Install a hook in `\everyhbox` or `\everyvbox` (whichever TeX is going to insert in the box). We then retrieve all the material that led to the current box into `\l_unravel_head_tl` in order to print it, then let TeX perform the box operation (here we need to provide the begin-group token, as it was scanned but not placed in the previous-input sequence). TeX inserts `\everyhbox` or `\everyvbox` just after the begin-group token, and the hook we did is such that all that material is collected and put into the input that we will study. We must remember to find a glue for leaders, and for this we use a stack of letters v, h for vertical/horizontal leaders, and Z for normal boxes.

2.13 Commands

We will implement commands in order of their command codes (some of the more elaborate commands call auxiliaries defined in other sections).

2.13.1 Characters: from 0 to 15

This section is about command codes in the range [0, 15].

- `relax=0` for `\relax`.
- `begin-group_char=1` for begin-group characters (catcode 1).
- `end-group_char=2` for end-group characters (catcode 2).
- `math_char=3` for math shift (math toggle in `expl3`) characters (catcode 3).
- `tab_mark=4` for `\span`
- `alignment_char=4` for alignment tab characters (catcode 4).
- `car_ret=5` for `\cr` and `\crcr`.
- `macro_char=6` for macro parameter characters (catcode 6).
- `superscript_char=7` for superscript characters (catcode 7).
- `subscript_char=8` for subscript characters (catcode 8).
- `endv=9` for `?`.
- `blank_char=10` for blank spaces (catcode 10).
- `the_char=11` for letters (catcode 11).
- `other_char=12` for other characters (catcode 12).

- `par_end=13` for `\par`.
- `stop=14` for `\end` and `\dump`.
- `delim_num=15` for `\delimiter`.

Not implemented at all: `endv`.

`\relax` does nothing.

```
2857 \__unravel_new_tex_cmd:nn { relax } % 0
2858   { \__unravel_print_action: }

Begin-group characters are sent to the output, as their grouping behaviour may affect the scope of font changes, for instance. They are also performed.

`\char` leaves vertical mode, then scans an integer operand, then calls `_unravel_char_in_mmode:n` or `_unravel_char:n` depending on the mode. See implementation of `the_char` and `other_char`.

We now implement the primitives `\show`, `\showbox`, `\showthe`, `\showlists`, `\showgroups`, `\showtokens` and `\showifs`. Those with no operand are sent to TeX after printing the action. Those with operands print first, then scan their operands, then are sent to TeX. The case of `\show` is a bit special, as its operand is a single token, which cannot easily be put into the previous-input sequence in general. Since no expansion can occur, simply grab the token and show it.

2.13.7 Assignments

Quoting `tex.web`: “Every prefix, and every command code that might or might not be prefixed, calls the action procedure `prefixed_command`. This routine accumulates a sequence of prefixes until coming to a non-prefix, then it carries out the command.” We define all those commands in one go, from `max_non_prefixed_command+1=71` to `max_command=102`.

```

```

`__unravel_prefixed_command:` Accumulated prefix codes so far are stored as the last item of the previous-input sequence.

__unravel_read_to_cs_safe:nTF After `\read` or `\readline`, find an int, the mandatory keyword `to`, and an assignable token. The `\read` and `\readline` primitives throw a fatal error in `\nonstopmode` and in `\batchmode` when trying to read from a stream that is outside [0, 15] or that is not open (according to `\ifeof`). We detect this situation using `__unravel_read_to_cs_safe:nTF` after grabbing all arguments of the primitives. If reading is unsafe, let the user know that `TeX` would have thrown a fatal error.

2.14 Expandable primitives

This section implements expandable primitives, which have the following command codes:

- `undefined_cs=103` for undefined control sequences (not quite a primitive).
- `expand_after=104` for `\expandafter` and `\unless`.
- `no_expand=105` for `\noexpand` and `\pdfprimitive`.
- `input=106` for `\input`, `\endinput` and `\scantokens`.
- `if_test=107` for the conditionals, `\if`, `\ifcat`, `\ifnum`, `\ifdim`, `\ifodd`, `\ifvmode`, `\ifhmode`, `\ifmmode`, `\ifinner`, `\ifvoid`, `\ifhbox`, `\ifvbox`, `\ifx`, `\ifeof`, `\iftrue`, `\iffalse`, `\ifcase`, `\ifdefined`, `\ifcsname`, `\iffontchar`, `\ifincharname`, `\ifpdfprimitive`, `\ifpdfabsnum`, and `\ifpdfabsdim`.
- `fi_or_else=108` for `\fi`, `\else` and `\or`.
- `cs_name=109` for `\csname`.
- `convert=110` for `\number`, `\romannumeral`, `\string`, `\meaning`, `\fontname`, `\eTeXrevision`, `\pdftexrevision`, `\pdftexbanner`, `\pdffontname`, `\pdffontobjnum`, `\pdffontsize`, `\pdfpageref`, `\pdfxformname`, `\pdfescapestring`, `\pdfescapename`, `\leftmarginkern`, `\rightmarginkern`, `\pdfstrcmp`, `\pdfcolorstackinit`, `\pdfescapehex`, `\pdfunescapehex`, `\pdfcreationdate`, `\pdffilemoddate`, `\pdffilesize`, `\pdfmdfivesum`, `\pdffiledump`, `\pdfmatch`, `\pdflastmatch`, `\pdfuniformdeviate`, `\pdfnormaldeviate`, `\pdfinsertht`, `\pdfximagebbox`, and `\jobname`.
- `the=111` for `\the`, `\unexpanded`, and `\detokenize`.
- `top_bot_mark=112` `\topmark`, `\firstmark`, `\botmark`, `\splitfirstmark`, `\splitbotmark`, `\topmarks`, `\firstmarks`, `\botmarks`, `\splitfirstmarks`, and `\splitbotmarks`.
- `call=113` for macro calls, implemented by `__unravel_macro_call::`.
- `end_template=117` for `\TeX`'s end template.

Let `\TeX` trigger an error.

If the `<head>` is a primitive `\if...`, then the `\if_true: \else:` ends with the second `\fi:`, and the nesting integer is incremented before appropriately closing the `\if_true:..`. If it is a normal token or `\or` or `\else`, `\use_none:nnn` cleans up, leaving the appropriate number of `\fi:`. Finally, if it is `\fi:`, the nesting integer is decremented before removing most `\fi:`.

2.16 Keys

Each key needs to be defined twice: for its default setting and for its setting applying to a single `\unravel`. This is due to the fact that we cannot use grouping to keep settings local to a single `\unravel` since the `<code>` argument of `\unravel` may open or close groups.

```
5199 \keys_define:nn { unravel/defaults }
5200 {
5201     explicit-prompt .bool_gset:N = \g__unravel_default_explicit_prompt_bool ,

The `machine` option is somewhat special so it is clearer to define it separately. The code is identical for `unravel/defaults` and `unravel` keys. To be sure of which options are set, use `.meta:nn` and give the path explicitly.
