Abstract

This package provides for Lual*TeX an ArabTeX-like interface to generate Arabic writing from an ASCII transliteration. It is particularly well-suited for complex documents such as technical documents or critical editions where a lot of left-to-right commands intertwine with Arabic writing. arabluatex is able to process any ArabTeX input notation. Its output can be set in the same modes of vocalization as ArabTeX, or in different roman transliterations. It further allows many typographical refinements. It will eventually interact with some other packages yet to come to produce from .tex source files, in addition to printed books, TEI xml compliant critical editions and/or lexicons that can be searched, analyzed and correlated in various ways.

1 Introduction

In comparison to Prof. Lagally's outstanding ArabTeX,¹ ArabLuaTeX is at present nothing more than a modest piece of software. Hopefully—if I may say so—it will eventually provide all of its valuable qualities to the Lual⁴TeX users.

arabtex dates back to 1992. As far as I know, it was then the first and only way to typeset Arabic texts with TeX and IATeX. To achieve that, arabtex provided—and still does—an Arabic font in $Nas\bar{h}\bar{\imath}$ style and a macro package that defined its own input notation which was, as the author stated, "both machine, and human, readable, and suited for electronic transmission and e-mail communication".² Even if

gp13+

CC BY-SA 4.0

¹See http://ctan.org/pkg/arabtex

²Lagally (2004, p. 2).

the same can be said about Unicode, ArabTEX ASCII input notation still surpasses Unicode input, in my opinion, when it comes to typesetting complex documents, such as scientific documents or critical editions where footnotes and other kind of annotations can be particulary abundant. It must also be said that most text editors have trouble in displaying Arabic script connected with preceding or following LATEX commands: it often happens that commands seem misplaced, not to mention punctuation marks, or opening or closing braces, brackets or parentheses that are unexpectedly displayed in the wrong direction. Of course, some text editors provide ways to get around such difficulties by inserting invisible Unicode characters, such as LEFT-TO-RIGHT or RIGHT-TO-LEFT MARKS (U+200E, U+200F), RTL/LTR "embed" characters (U+202B, U+202A) and RLO/LRO "bidi-override" characters (U+202E, U+202D). Nonetheless, it remains that inserting all the time these invisible characters in complex documents rapidly becomes confusing and cumbersome.

The great advantage of ArabTEX notation is that it is immune from all these difficulties, let alone its being clear and straightforward. One also must remember that computers are designed to process code. ArabTEX notation is a way of encoding Arabic language, just as TEX "mathematics mode" is a way of processing code to display mathematics. As such, not only does it allow greater control over typographical features, but it also can be processed in several different ways: so without going into details, depending on one's wishes, ArabTEX input can be full vocalized Arabic (scriptio plena), vocalized Arabic or non-vocalized Arabic (scriptio defectiva); it further can be transliterated into whichever romanization standard the user may choose.

But there may be more to be said on that point, as encoding Arabic also naturally encourages the coder to vocalize the texts—without compelling him to do so, of course. Accurate coding may even have other virtuous effects. For instance, hyphens may be used for tying particles or prefixes to words, or to mark inflectional endings, and so forth. In other words, accurate coding produces accurate texts that can stand to close grammatical scrutiny and to complex textual searches as well.

Having that in mind, I started arabluatex. With the help of Lua, it will eventually interact with some other packages yet to come to produce from .tex source files, in addition to printed books, TEI xml compliant critical editions and/or lexicons that can be searched, analyzed and correlated in various ways.

1.1 arabluatex is for Lual⁴T_EX

It goes without saying that arabluatex requires LuaIATEX. TEX and IATEX have arabtex, and XHATEX has arabxetex. Both of them are much more advanced than arabluatex, as they can process a number of different languages, whereas arabluatex can process only Arabic for the time being. More languages will be included in future releases of arabluatex.

³Gáspár Sinai's Yudit probably has the best Unicode support. See http://www.yudit.org.

⁴To date, both packages support Arabic, Maghribi, Urdu, Pashto, Sindhi, Kashmiri, Uighuric and Old Malay; in addition to these, arabtex also has a Hebrew mode, including Judeo-Arabic and Yiddish.

In comparison to arabxetex, arabluatex works in a very different way. The former relies on the TECkit engine which converts ArabTEX input on the fly into Unicode Arabic script, whereas the latter passes ArabTEX input on to a set of Lua functions. At first, IATEX commands are taken care of in different ways: some, as \emph, \textbf and the like are expected to have Arabic text as arguments, while others, as \LR, for "left-to-right text", are not. Then, once what is Arabic is carefully separated form what is not, it is processed by other Lua functions which rely on different sets of correpondence tables to do the actual conversion in accordance with one's wishes. Finally, Lua returns to TEX the converted strings—which may in turn contain some other ArabTEX input yet to be processed—for further processing.

2 The basics of arabluatex

2.1 Activating arabluatex

arabluatex is loaded the usual way:

```
\usepackage{arabluatex}
```

The only requirement of arabluatex is LuaIATEX; it will complain if the document is compiled with another engine. That aside, arabluatex does not load packages such as polyglossia. Although it can work with polyglossia, it does not require it.

Font setup Any Arabic font can be defined to be used with arabluatex. For example, assuming that fontspec is loaded, this line may be inserted in the preamble, just above the line that loads arabluatex:

```
\verb|\newfontfamily\arabicfont{||} \langle fontname \rangle \} [Script = Arabic] |
```

where \(\langle fontname \rangle \) is the standard name of the Arabic font to be used.

By default, if no Arabic font is selected, arabluatex will issue a warning message and attempt to load the Amiri font⁵ like so:—

```
\newfontfamily\arabicfont{Amiri}[Script=Arabic]
```

REM. By default Amiri places the *kasrah* in combination with the *tašdīd* below the consonant, like so: ... That is correct, as at least in the oldest manuscripts may stand for as well as ... See Wright (1896, i. 14 C-D). The placement of the *kasrah* above the consonant may be obtained by selecting the ss05 feature of the Amiri font, like so:—

Other Arabic fonts may behave differently.

2.2 Options

arabluatex may be loaded with five global options, the first four of which are mutually exclusive and may be overriden at any point of the document (see below section 2.3.1 on page 9):

⁵Hosny (2017).

⁶See the documentation of amiri, Hosny (2017, p. 6).

voc

Default

In this mode, which is the one selected by default, every short vowel written generates its corresponding diacritical mark: dammah (1), fathah (1) and kasrah (1). If a vowel is followed by N, viz. $\langle uN, aN, iN \rangle$, then the corresponding $tanw\bar{i}n$ (1, 1)ةً, σ or ω) is generated. Finally, $\langle u, a, i \rangle$ at the commencement of a word indicate a "connective 'alif" ('alifu 'l-wasli), but voc mode does not show the waslah above the 'alif; instead, the accompanying vowel may be expressed at the beginning of a sentence (111).

fullvoc

In addition to what the voc mode does, fullvoc expresses the $suk\bar{u}n$ and the waslah.

novoc

None of the diacritics is showed in novoc mode, unless otherwise specified (see "quoting" technique below section 4.4 on page 22).

trans

This mode transliterates the ArabT_EX input into one of the accepted standards. At present, three standards are supported (see below section 8 on page 40 for more details):

dmg Deutsche Morgenländische Gesellschaft, which is selected by default;

loc Library of Congress;

arabica Arabica.

More standards will be included in future releases of arabluatex.

export

Default: false

export=true|false This option acts as a named argument and does not need a value as it defaults to true if it is used. It enables arabluatex to produce a duplicate of the original .tex source file in which all ASCII strings are replaced with Unicode equivalents. See below section 12 on page 58 for more information.

2.2.1 Classic contrasted with modern typesetting of Arabic

By default, arabluatex typesets Arabic in a classic, traditional style the most prominent features of which are the following:

- 'Classic' maddah: when 'alif and hamzah accompanied by a simple vowel or tanwin is preceded by an 'alif of prolongation ($\dot{\mathsf{L}}$), then a mere hamzah is written on the line, and a maddah is placed over the 'alif, like so:—

samA'uN يَّسَاءَوُنَ $sam\bar{a}$ 'un, jA'a جَاءَ ۾ $\check{g}\bar{a}$ 'a, yatasA'alUna يَّسَاءَوُنَ $yatas\bar{a}$ 'al $\bar{u}na^7$ (see on page 16 for further details).

- The euphonic $ta\check{s}d\bar{\imath}d$ is generated (see on page 17).
- In fullvoc mode, the $suk\bar{u}n$ is expressed.
- In such words as ظُمُّا ,شَيْعًا and the like, the hamzah alone is not written over the letter $yar{a}$ with no diacritical points below as in ظِمِمًا , شَيِئًا, but over a horizontal stroke placed in the continuation of the preceding letter.

New feature v.1.13

New feature v.1.2

⁷ Note that in old mss. such forms as أَبُسَ are also found; see Wright (1896, i. 24 D).

Please note that only few Arabic fonts provide such contrivances. In case this feature is not supported by some Arabic font, it is advisable to use \SetArbEasy.

New feature v1.4.4

\SetArbEasy

\SetArbEasy*

\SetArbDflt

New feature v1.6

\SetArbDflt*

Such refinements as 'classic' maddah may be discarded by the \SetArbEasy command, either globally in the preamble or locally at any point of the document. The difference between \SetArbEasy and its 'starred' version \SetArbEasy* is that the former keeps the $suk\bar{u}n$ that is generated by the fullvoc mode, while the latter further takes it away. Default 'classic' rules may be set back at any point of the document with the \SetArbDflt command. Assimilation rules laid on item (b) on page 17 may also be applied by the 'starred' version of this command \SetArbDflt* either in the preamble or at any point of the document.⁸ Examples follow:—

- (a) \SetArbDflt:
 - وَمَاتَ استِسْفَآءً قَبَلَ أَن يُتِمَّ كِتَابَهُ فِي نُجُومِ السَّمَآءِ i. voc
 - وَمَاتَ ٱسْتِسْقَاءً قَبْلَ أَنْ يُتِمَّ كِتَابَهُ فِي نُجُومِ ٱلسَّمَاءِ ii. fullvoc
 - iii. trans wa-māta 'stisqā'an qabla 'an yutimma kitāba-hu fī nuǧūmi 's $sam\bar{a}^{,i}$
- (b) \SetArbDflt*:
 - وَمَاتَ استِسقَآءً قَبَلَ أَن يُتُمَّ كِتَابَهُ فِي نُجُومِ السَّمَآءِ i. voc

 - ii. fullvoc وَمَاتَ اَسْتِسْقَآ ۚ قَبْلَ أَن يُّتِمَّ كَلَابُهُ فِي نُجُومِ ٱلسَّمآ وَمَاتَ اَسْتِسْقَآ ۚ قَبْلَ أَن يُتِّمَ كَلَابَهُ فِي نُجُومِ ٱلسَّماَ وَمَاتَ اَسْتِسْقَآ ءً قَبْلَ أَن يُتِمَّ كَلَابَهُ فِي نُجُومِ ٱلسَّماَ وَمَاتَ لَا اللّهُ ا $sam\bar{a}^{,i}$
- (c) \SetArbEasy:
 - وَمَاتَ استِسقَاءً قَبَلَ أَن يُتِمَّ كِتَابَهُ فِي نُجُومِ السَّمَاءِ i. voc
 - وَمَاتَ ٱسْتِسْقَاءً قَبْلَ أَنْ يُتِمَّ كِتَابَهُ فِي نُجُومِ ٱلسَّمَاءِ ii. fullvoc
 - iii. trans wa- $m\bar{a}ta$ 'stis $q\bar{a}$ 'an' qabla 'an yutimma $kit\bar{a}ba$ -hu $f\bar{\iota}$ $nu\check{g}\bar{u}m^i$'s $sam\bar{a}^{,i}$
- (d) \SetArbEasy*:
 - وَمَاتَ استِسقَاءً قَبَلَ أَن يُتِمَّ كَتَابَهُ فِي نُجُومِ السَّمَاءِ i. voc
 - وَمَاتَ ٱستِسقَاءً قَبَلَ أَن يُتِمَّ كِتَابَهُ فِي نُجُومِ ٱلسَّمَاءِ ii. fullvoc
 - iii. trans wa-māta 'stisqā'an qabla 'an yutimma kitāba-hu fī nuǧūmi 's $sam\bar{a}^{,i}$

Please note that this document is typeset with \SetArbDflt throughout.

2.3 Typing Arabic

Once arabluatex is loaded, a $\arb{\langle Arabic\ text \rangle}$ command is available for inserting

⁸For an example, see section 5.1 on page 31.

Arabic text in paragraphs, like so:—

```
1 From \textcite[i. 1 A] {\text{Wright}}:--- Arabic, like Hebrew and Syriac, is written and read from right to left. The letters of the alphabet (\arb{.hurUf-u 'l-hijA'-i}, \arb{.hurUf-u 'l-tahajjI}, \arb{al-.hurUf-u 'l-hijA'iyyaT-u}, or \arb{.hurUf-u 'l-mu`jam-i}) are twenty-eight in number and are all consonants, though three of them are also used as vowels (see §~3).

From Wright (1896, i. 1 A):— Arabic, like Hebrew and Syriac, is written and read from right to left. The letters of the alphabet (وَرُونُ الْمُجَلِّ الْمُجَلِي الْمُجَلِّ الْمُجَلِّ الْمُجَلِّ الْمُجَلِّ الْمُجَلِّ الْمُجَلِي الْمُجَلِّ الْمُجَلِّ الْمُحَلِّ الْمُجَلِّ الْمُجَلِّ الْمُحَلِي الْمُحَلِّ الْمُحَلِّ الْمُحَلِّ الْمُحَلِّ الْمُحَلِّ الْمُحِلِّ الْمُحَلِّ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقُ الْمُحْرِقِ الْمُحْرِقُ الْمُحْرِقِ ا
```

Caveat For some reason, left-to-right paragraphs that start with Arabic words lose their indentation. For the time being, this can be circumvented by appending the \indent command at the commencement of such paragraphs.

The same remark applies to left-to-right list environments: when items start with Arabic words, the \arb command must be prefixed with \indent. The following example comes from Wright (1896, i. 213 C):—

```
\tegin {enumerate} [label=\Roman*., start=16]
\text{item \indent\arb{fawA\ilu}*.}
\text{begin{enumerate} [label=\arabic*.]}
\text{item \indent\arb{fA\aluN}; as \arb{_hAtamuN} \emph{a}
\text{signet-ring}, ...
\text{end{enumerate}}
\text{volumerate}
\text{XVI.} فَوَاعِلُ *.
\text{1.} فَوَاعِلُ a signet-ring, ...
```

Running paragraphs of Arabic text should rather be placed inside an Arabic environment

```
1  \begin{arab}
2  [...]
3  \end{arab}
```

like so:-

```
\begin {arab}
      'at_A .sadIquN 'il_A ju.hA ya.tlubu min-hu .himAra-hu
      li-yarkaba-hu fI safraTiN qa.sIraTiN fa-qAla la-hu:
      \enquote{sawfa 'u`Idu-hu 'ilay-ka fI 'l-masA'-i
      wa-'adfa'u la-ka 'ujraTaN.} fa-qAla ju.hA:
      \enquote{'anA 'AsifuN jiddaN 'annI lA 'asta.tI`u 'an
      'u.haqqiqa la-ka ra.gbata-ka fa-'l-.himAr-u laysa hunA
      'l-yawm-a.} wa-qabla 'an yutimma ju.hA kalAma-hu bada'a
      'l-.himAr-u yanhaqu fI 'i.s.tabli-hi. fa-qAla la-hu
      .sadIqu-hu: \enquote{'innI 'asma`u .himAra-ka yA ju.hA
10
      yanhaqu.} fa-qAla la-hu ju.hA: \enquote{.garIbuN
11
      'amru-ka yA .sadIqI 'a-tu.saddiqu 'l-.himAr-a
12
      wa-tuka_d_diba-nI?}
13
     \end{arab}
```

أَتَى صَدِيقٌ إِلَى جُعَا يَطلُبُ مِنهُ حَمَارُهُ لِيرَكَبَهُ فِي سَفَرَة قَصِيرَة فَقَالَ لَهُ: "سَوفَ أُعِيدُهُ إِلِيكَ فِي الْمَسَآءِ وَأَدْفَعُ لَكَ أُجَرَةً." فَقَالَ جُعَا: "أَنَا آسِفُ جِدًّا أَنِي لا أَستَطِيعُ أَن أُحقِّقَ لَكَ رَغَبَتَكَ فَالحَمَارُ لَيسَ هُنَا اليَومَ." وَقَبَلَ أَن يُتِمَّ جُعَا كَلَامَهُ بَدَأً الحَمَارُ يَنَهُ فِي إِصطَبلِهِ. فَقَالَ لَهُ صَدِيقُهُ: "إِنِّي أَسَعُ حَمَارَكَ يَا جُعَا يَنَهَيُهُ." فَقَالَ لَهُ جُعَادَ " فَقَالَ لَهُ جُعَادَ " فَقَالَ لَهُ جُعَادَ " فَقَالَ لَهُ جُعَادً " فَقَالَ لَهُ جُعَادً " فَقَالَ لَهُ جُعَادً " فَقَالَ لَهُ جُعَادً " فَعَر يبُ أَمْ كُ يَا صَدِيقِي أَتَصَدِّقُ الْجَمَارُ وَتُكَذِّبَنِي؟"

2.3.1 Local options

As seen above in section 2.2 on page 5, arabluatex may be loaded with four mutually exclusive global options: voc (which is the default option), fullvoc, novoc and trans. Whatever choice has been made globally, it may be overriden at any point of the document, as the \arb command may take any of the voc, fullvoc, novoc or trans modes as optional argument, like so:—

```
\begin{array}{lll} & \text{voc} & - \operatorname{voc} \{\langle Arabic\; text \rangle\}; \\ & \text{fullvoc} & - \operatorname{fullvoc} \{\langle Arabic\; text \rangle\}; \\ & \text{novoc} & - \operatorname{novoc} \{\langle Arabic\; text \rangle\}; \\ & \text{trans} & - \operatorname{trans} \{\langle Arabic\; text \rangle\}. \end{array}
```

The same optional arguments may be passed to the environment arab: one may have $\ensuremath{\mbox{begin}\{arab\}[\langle mode\rangle]...\ensuremath{\mbox{arab}\}}$, where $\langle mode\rangle$ may be any of voc, fullvoc, novoc or trans.

3 Standard ArabTEX input

3.1 Consonants

Table 1 gives the ArabTEX equivalents for all of the Arabic consonants.

<u> </u>	ah	ah	a	

Table 1: Standard ArabTEX (consonants)

Rem. a. Please note that in all cases of elision, the 'alifu 'l-waṣli is expressed only by the vowel that accompanies the omitted hamzah: $\langle u, a, i \rangle$ as in wa-inhazama wa-inhazama. For more details on the definite article and the 'alifu 'l-wasli see section 4.2 on page 18.

⁹See below section 8 on page 40. ¹⁰See below, *Rem. a.* For *alif* as a consonant, see Wright (1896, i. 16 D). The *hamzah* itself is encoded <'> and may be followed by either $\langle u, a \rangle$ or $\langle i \rangle$. See below section 4.2 on page 15.

 $^{^{11} \}mbox{For the letter} \ \mbox{ω}$ with no diacritical points below, see $Rem.\ b.$ below.

That said, I as a consonant is actually the $spiritus\ lenis$ of the Greeks and is distinguished by the hamzah (*) as it is shown in the above table. However, the bare 'alif may also be encoded as . A whether it be followed by a vowel or not, like so: wa-. An $\hat{\varrho}$ \hat{u} wa-.n (where the dot symbolizes the absence of vowel), wa-. Aan $\hat{\varrho}$ \hat{u} wa-an, wa-. Ain \hat{u} \hat{u} wa-in.

REM. b. The letter ي with two points below, إَلَيَا ۚ النَّقَاةُ مِن تَحْبَا (, may also be written without diacritical points as ي. When it is used as a consonant, it is encoded ay, where a recalls the fathah placed above the preceding letter in vocalized Arabic, like so: qay'un وَيُّ عُن يَا يُعْمِ 'un, `say'un مُنْعَا 'say'un, `say'an šay'an مُنْعَا أَنْ يَعْمُ 'an, `say'an مُنْعَا أَنْهُ اللهُ عَلَيْهُ اللهُ عَلَيْهُ اللهُ اللهُ

The same result may be achieved by encoding this letter as .y, like so: qa.y'uN وَأَنْ qay'^{un} , ^sa.y'uN فَيْءُ $\ddot{s}ay'^{un}$, ^sa.y'uN شَيءً $\ddot{s}ay'^{un}$, ^sa.y'uN شَيءً $\ddot{s}ay'^{un}$, °sa.y'uN أَسُتُ

3.3 Vowels

New feature v1.8.5

3.3.1 Long vowels

Table 3 gives the ArabTEX equivalents for the Arabic long vowels.

¹²See below section 8 on page 40.

¹³The characters that are listed in this table are not included in this standard. However, as arabica is based on dmg, the dmg equivalents have been used here.

 $^{^{14}}$ This character is not found in Brockelmann et al. (1935, p. 2). It is taken from the DIN 31 635 (2011) standard.

¹⁵See note 14.

Letter	Transliteration ¹⁶			ArabT _E X notation
	dmg	loc	arabica	
1	\bar{a}	\bar{a}	\bar{a}	A
و	\bar{u}	\bar{u}	\bar{u}	U
ي	$\bar{\imath}$	$\bar{\imath}$	$\bar{\imath}$	I^{17}
ي 18 ي	\bar{a}	á	\bar{a}	_A or Y
7	\bar{a}	\bar{a}	\bar{a}	_a
-	\bar{u}	\bar{u}	\bar{u}	_u
-	$\bar{\imath}$	$\bar{\imath}$	$\bar{\imath}$	_i

Table 3: Standard ArabTEX (long vowels)

Rem. a. The long vowels \bar{a} , \bar{u} , \bar{i} , otherwise called $hur\bar{u}f^u$ 'l-madd', the letters of prolongation, involve the placing of the short vowels a, u, i before the letters |, $_{\mathfrak{I}}$, respectively. arabluatex does that automatically in case any from voc, fullvoc or trans modes is selected e.g. قَالَ $q\bar{a}la$, فَيلُ $q\bar{a}la$, فَيلُ $q\bar{a}la$, فَيلُ $q\bar{a}la$, فَيلُ $q\bar{a}la$,

REM. b. Defective writings, such as ½, al-ʾalifu ʾl-maḥḍūfatu, or defective writings of \bar{u} and \bar{t} are encoded _a _u and _i respectively, e.g. _d_alika خُلُفَهُ بُنُ الْقِكَةُ الرَّمْنُ for Ḥuḍayfatu bnu 'l-yamānī, etc. (اَلْفَاكَةُ الرَّمْنُ

3.3.2 Short vowels

Table 4 gives the ArabTEX equivalents for the Arabic short vowels.

-	un	un	un	uN
- #	in	in	in	iN

Table 4: Standard ArabTFX (short vowels)

 $^{^{16}\}mathrm{See}$ below section 8 on page 40.

¹⁷For the letter \wp with no diacritical points, see Rem. c. below.

 $^{^{18}=}$ al-' $alif^u$ 'l-maq $s\bar{u}rat^u$.

¹⁹See below section 8 on page 40.

Whether Arabic texts be vocalized or not is essentially a matter of personal choice. So one may use voc mode and decide not to write vowels except at some particular places for disambiguation purposes, or use novoc mode, not write vowels—as novoc normally does not show them—except, again, where disambiguation is needed.²⁰

However, it may be wise to always write the vowels, leaving to the various modes provided by arabluatex to take care of showing or not showing the vowels.

That said, there is no need to write the short vowels fatḥah, ḍammah or kas-rah except in the following cases:—

- at the commencement of a word, to indicate that a connective 'alif is needed, with the exception of the article (see below section 4.4 on page 22);
- when arabluatex needs to perform a contextual analysis to determine the carrier of the *hamzah*;
- in the various transliteration modes, as vowels are always expressed in romanized Arabic.

4 arabluatex in action

4.1 The vowels and diphthongs

Short vowels As said above, they are written $\langle a, u, i \rangle$:

Long vowels They are written $\langle U, A, I \rangle$:

qAla وَالَ
$$q\bar{a}la$$
, bl`a يِع $b\bar{\imath}$ a, .tUruN عُلورٌ $t\bar{u}r^{un}$, .tInuN عُلينٌ $t\bar{\imath}n^{un}$, murU'aTuN مُرُوءَةً $mur\bar{u}$ at un .

'alif maqṣūrah It is written $\langle _A \rangle$ or $\langle Y \rangle$:

al-fat_A اَلْفَتَى
$$al$$
-fat $ar{a}$, al-maqh_A الْفَتَى al -maqh $ar{a}$, 'il_A الْفَتَى al -fat $ar{a}$

'alif otiosum Said 'alif" 'l-wiqāyat', "the guarding 'alif", after ${}_{\bullet}$ at the end of a word, both when preceded by dammah and by fathah is written $\langle UA \rangle$ or $\langle aW, aWA \rangle$:

na . sar`UA` أَضُرُ
$$naṣarar{u}$$
, katab`UA` كَتَبُوا $katabar{u}$, ya . gz`UA` يُغزُوا $ya\dot{g}zar{u}$, rama`W` رَمُوْا , $banaw$, bana`WA` أَبُوُا , $banaw$.

²⁰See below section 4.4 on page 22.

'alif maḥdūfah and defective $\bar{\mathbf{u}}$, $\bar{\mathbf{i}}$ They are written $\langle a, i u \rangle$:

Silent $2/\sqrt{2}$ Some words ending with $3\sqrt{2}$ are usually written $3\sqrt{2}$ instead of $3\sqrt{2}$ see Wright (1896, i. 12 A). arabluatex preserves that particular writing; the same applies to words ending in $3\sqrt{2}$ for $3\sqrt{2}$. Long vowels $3\sqrt{2}$ shall receive no $3\sqrt{2}$ after a 'alif $3\sqrt{2}$ and are discarded in trans mode:

. hay_aUTuN مُشْكُوةُ $hayar{a}t^{un}$, .sal_aUTuN مُشْكُوةُ $salar{a}t^{un}$, mi^sk_aUTuN مُشْكُوةُ $mis-kar{a}t^{un}$, tawr_aITuN مُشْكُوةً $tawrar{a}t^{un}$.

And so also: al-rib_aIT-u اُلرِّيٰڍ ُ $ar\text{-}rib\bar{a}t^u$.

'Amr^{un}, and the silent $_{\bullet}$ To that name a silent $_{\bullet}$ is added to distinguish it from $Umar^u$: see Wright (1896, i. 12 C). In no way this affects the sound of the $tanw\bar{\imath}n$, so it has to be discarded in trans mode:

- `amruNU عُمْرِو 'amrun' 'a

When the $tanw\bar{\imath}n$ falls away (Wright 1896, i. 249 B): `amr-uU bn-u mu.hammadiN عَرُو بُنْ مُحَّرُو بُنْ مُحَرُو بُنْ مُحَرُو بُنْ مُحَرِّو بُنْ مُحَدِّد Amr^u bn^u $Muhammad^{in}$, mu.hammad-u bn-u `amr-iU bn-i _hAlidiN مُحَدُّدُ بُنُ عَرُو بُنِ خَالِد $Muhammad^u$ bn^u Amr^i bn^i $H\bar{a}lid^{in}$.

And so also: al-rib_aUA اَلرَّبُوا $ar-ribar{a}$, ribaNU رَبُوا rib^{an} .

tanwin The marks of doubled short vowels, \bar{z} , \bar{z} , are written $\langle uN, aN, iN \rangle$ respectively. arabluatex deals with special cases, such as \bar{z} taking an 1 after all consonants except \bar{z} , and $tanw\bar{z}n$ preceding z as in z, which is written z or z or z.

mAluN مُدينَةً $m\bar{a}l^{un}$, bAbaN بَابًا $b\bar{a}b^{an}$, madInaTaN مُدينةً $mad\bar{\imath}nat^{an}$, bintiN مُذيّ $bint^{in}$ maqhaN_A مُقهَى $maqha^n$, fataNY بنت

arabluatex is aware of special orthographies: ^say'uN شَيءُ $\check{s}ay'^{un}$, ^say'aN شُيءً $\check{s}ay'^{an}$, ^say'iN شُيءً $\check{s}ay'^{in}$.

In some cases, it may be useful to mark the root form of defective words so as to produce a more accurate transliteration of ending $tanw\bar{\imath}n$. As seen above, $tanw\bar{\imath}n$ preceding ${}_{\mathcal{S}}$ is written $\langle aN_A\rangle$ or $\langle aNY\rangle$. Such forms as $\check{}_{\mathcal{S}}$ is written $\langle iNI\rangle$:—

al-qA.dI قَاضِ al-qā $dar{\imath}$, qA.diyaN قَاضِيًا $qar{a}diy^{an}$, qA.diNI قَاضِ $qar{a}di^n$.

4.2 Other orthographic signs

 $t\bar{a}$ ' marbūṭah It is written $\langle T \rangle$:

madInaTuN مُدينَةٌ $mad\bar{\imath}nat^{un},$ madInaTaN مُدينة $mad\bar{\imath}nat^{an},$ madInaTiN مُدينة $mad\bar{\imath}nat^{in}.$

hamzah It is written $\langle ' \rangle$, its carrier being determined by contextual analysis. In case one wishes to bypass this mechanism, he can use the "quoting" feature that is described below in section 4.4 on page 22.

Initial hamzah: ˈasaduN أُسُدُ ˈasadun, ˈu_htuN أُخُتُ ˈuhtun أُخُتُ ˈuhtun أُخُتُ ˈiqlīdun إنَّ anna, ˈinna إنَّ inna.

hamzah followed by the long vowel و is encoded '_U: '_U1_A وَلَى $i \bar{l} \bar{u} l \bar{u}$, '_U1U أُولَى $i \bar{l} \bar{u} l \bar{u}$, '_U1A' ika أُولُوَ $i \bar{l} l \bar{u} i k a$.

hamzah followed by the long vowel ي is encoded '_I: '_ImAnuN يَا يُكُانُ $imar{a}$ - n^{un21} .

From Wright (1896, i. 14 B):— All consonants, whatsoever, not even 'alif hèmzatum excepted, admit of being doubled and take $ta\check{s}d\bar{\iota}d$. Hence we speak and write ra''AsuN رُأَاسُ ra'' $\bar{a}s^{un}$, sa''AluN سَأَالُ sa'' $\bar{a}l^{un}$, na''AjuN سَأَالُ na'' $\bar{a}\check{g}^{un}$.

 $^{^{21}}$ For another way of encoding the initial hamzah followed by a long vowel, see the $tahfif^u$ 'l-hamzat' on the following page.

Final hamzah: xa.ta'un خَطُ خُطُ الْخُهُ الْهُ الْمُ الْهُ الْهُ الْمُ الْمُعُلِمُ الْمُ

^say'uN شَيءِ $\check{s}ay'^{un}$, ^say'aN شَيءً $\check{s}ay'^{an}$, ^say'iN مَيء $\check{s}ay'^{in}$, al^say'-u أَشياءً $a\check{s}-\check{s}ay'^u$, 'a^syA'-u أَشياءً $a\check{s}y\bar{a}^{'u}$, 'a^syA'-a أَشياءً $\check{a}\check{s}y\bar{a}^{'a}$, .zim'aN فَامعً zim'^{an} , radI'aN رُدِعًا $rad\bar{\iota}^{'an}$.

taḥfifu 'l-hamzati: if the hamzah has ğazmah and is preceded by 'alif hamzatum, it must be changed into the letter of prolongation that is homogeneous with the preceding vowel; hence: 'a'mana المَنْ 'āmana, 'u'minu' أُومِنُ 'ūminu, 'i'mAnuN' إِيمَانُ 'īmānun. For other possible ways of encoding such sequences, see on the previous page (hamzah followed by and على) and the maddah on this page.

Imperatives of verbs that have the hamzah as the first radical are other cases of $tahf\bar{\imath}f^u$ 'l- $hamzat^i$: i'sir اِسِرُ $\bar{\imath}sir$, i'_dan اِيذَنْ $\bar{\imath}dan$, u'mul $\bar{\imath}sir$, i'_dan اَوْمَلْ $\bar{\imath}dan$, u'mul $\bar{\imath}amul$. arabluatex also provides ways of encoding those words when the initial 'alif comes into wasl, so as to make the 'alif wasl fall away when preceded by $\bar{\imath}$ or $\bar{\imath}$ wa-'sir, fa-'_dan ' $\bar{\imath}$ ' $\bar{\imath}$ $\bar{\imath}$ wa-'tamir $\bar{\imath}$; or be retained outside the imperative, as in fa-i'tazarat $\bar{\imath}$ $\bar{\imath$

maddah At the beginning of a syllabe, 'alif with hamzah and fatḥah (أ) followed by 'alifu 'l-maddi ('alif of prolongation) or 'alif with hamzah and ğazmah (أ) are both represented in writing 'alif with maddah: (see Wright 1896, i. 25 A-B).

Hence one should keep to this distinction and encode 'a'kulu \hat{j} ' $\bar{a}kulu$ and 'AkiluN ' $\bar{a}kil^{un}$ respectively.

arabluatex otherwise determines al-' $alif^u$ 'l- $mamd\bar{u}dat^u$ by context analysis.

'is'AduN ْأَمَنّا أَهُ الْمَالَ 'is'
$$\bar{a}d^{un}$$
, 'AkilUna الْكُونُ $\bar{a}kil\bar{u}na$, 'a'mannA آمَنّا أَمَنّا $\bar{a}l$ -qur'An-u الْقُرَانُ al -qur' $\bar{a}n^u$.

j A 'a َ آَ جَ $\check{g}\bar{a}$ 'a, yatas A 'al Una يُسَآ ءَلُونَ $yatas \bar{a}$ 'al $\bar{u}na$, rid A 'uN رِدآءُ $id\bar{a}$ 'un, xaba 'A خَا بَغْبَانِ $id\bar{a}$ 'un غُبَانِ $id\bar{a}$ 'un, xaba 'A خَا بَغْبَانِ $id\bar{a}$ 'un, xaba 'A خَا بَغْبَانِ $id\bar{a}$ 'un,

šaddah $tašd\bar{\imath}d$ is either necessary or euphonic.

The necessary tašdīd always follows a vowel, whether short or long (see Wright 1896, i. 15 A-B). It is encoded in writing the consonant that carries it twice:

`allaqa مَادَّ allaqa, mAdduN مَادُّ $m\bar{a}dd^{un}$, 'ammara أَمِّ ammara, murruN مَدُّ $murr^{un}$.

The euphonic tašdīd always follows a vowelless consonant which is passed over in pronunciation and assimilated to a following consonant. It may be found (Wright 1896, i. 15 B-16 C):—

(a) With the solar letters ت, ث, ب, ب, ب, س, س, ب, س, بض, ط, بظ, بظ, ف, after the article الله عائد.

Unlike arabtex and arabxetex, arabluatex never requires the solar letter to be written twice, as it automatically generates the euphonic $ta\check{s}d\bar{\imath}d$ above the letter that carries it, whether the article be written in the assimilated form or not, e.g. al- s ams-u اَلشَّمْسُ aš- s ams-u اَلشَّمْسُ aš- s ams-u.

al-tamr-u اَلَّرَّ مَنُ
$$at$$
-tamr u , al-ra.hm_an-u الرَّحْنُ ar -raḥm $\bar{a}n^u$, al-zulm-u اللَّغَةُ az -zulm u , al-lugat u .

(b) With the letters $_{\circ}$, $_{\circ}$, $_{\circ}$, $_{\circ}$, $_{\circ}$ after $_{\circ}$ with $\check{g}azmah,$ and also after the $tanw\bar{\imath}n$:—

Note the absence of $suk\bar{u}n$ above the passed over $\dot{\upsilon}$ in the following examples, each of which is accompanied by a consistent transliteration: min rabbi-hi مِن لَّيْلِ mil av mir min min

With $tanw\bar{\imath}n$: kitAbuN mubInuN كَاْبُ مُبِينٌ $kit\bar{a}b^{um}$ $mub\bar{\imath}n^{un}$.

REM. This particular feature must be put into operation by the \SetArbDflt* command explicitly. See above section 2.2.1 on page 6 for further details. Other kinds of assimilations, including the various cases of $id\bar{g}\bar{a}m$, will be included in arabluatex gradually.

(c) With the letter ت after the dentals في جذ , د ,ث ,ن in certain parts of the verb: this kind of assimilation, e.g. لَبِثْتُ for لَبِثْتُ labitu, will be discarded here, as it is largely condemned by the grammarians (see Wright 1896, i. 16 B-C).

The definite article and the 'alifu 'l-waṣl' At the beginning of a sentence, i is never written, as اُحْمَدُ لَٰهُ ; instead, to indicate that the 'alif is a connective 'alif ('alifu' 'l-waṣl'), the hamzah is omitted and only its accompanying vowel is expressed:

al-.hamd-u li-l-l_ah-i المُبْدُلُونُ
$$al$$
- $hamd$ u li - l - $l\bar{a}h$ i .

As said above on page 6, fullvoc is the mode in which arabluatex expresses the $suk\bar{u}n$ and the waslah. arabluatex will take care of doing that automatically provided that the vowel which is to be absorbed by the final vowel of the preceding word be properly encoded, like so:—

- (a) Definite article at the beginning of a sentence is encoded

 al-, or a solar letter if one wishes to mark the assimilation—which is in no way required, as arabulatex will detect all cases of assimilation.
- (b) Definite article inside sentences is encoded

 '1- or '<solar letter>-.
- (c) In all remaining cases of elision, the 'alifu 'l-waṣli' is expressed by the vowel that accompanies the omitted hamzah: $\langle u, a, i \rangle$.

Article: bAb-u 'l-madrasat-i بَابُ ٱلْمُدْرَسَةِ $b\bar{a}b^u$ 'l-madrasat', al-maqA lat-u 'l-'__Ul_A الْفَالَةُ ٱلْأُولَى al-maqālat'' 'l-'ūlā, al-lu.gat-u 'l-`ara biyyat-u 'l-`arabiyyat'', fI .sinA`at-i 'l-.tibb-i أَلُونَا اللَّهُ ٱلْعَرَبِيَّةُ الْعَرَبِيَّةُ ٱلطَّبِّ الْعَلَيْ الْعَرَبِيَّةُ الْطَبِّ الْعَلِيْ الْعَبْقُ الْطَبِّ الْعَلْمِ أَلُونَا اللَّهُ الْعَرَبِيَّةُ الْطَبِّ الْعَلْمِ اللَّهُ الْعَرَبِيَّةُ الْعَلْمِ اللَّهُ الْعَرَبِيَّةُ الْعَلِيْ الْمُعْتَى ا

Particles:-

- (a) li-: 'alifu 'l-waṣli is omitted in the article 'l' when it is preceded by the preposition الْرَّجُلُ : li-l-rajul-i للرَّجُلُ $li-r-rayul^i$. If the first letter of the noun be $\dot{\mathcal{L}}$, then the $\dot{\mathcal{L}}$ of the article also falls away, but arabluatex is aware of that: li-l-laylaT-i النَّيَاد li-laylaT-i النَّيَاد li-
- (b) la-: the same applies to the affirmative particle \hat{J} : la-l-.haqq-u
- لَّحْقُ la-l-ḥaqq". (c) With the other particles, 'alif" 'l-waṣl' is expressed: fI 'l-madIna T-i فِي ٱلْمُدِينَة fi 'l-madīnat', wa-'l-rajul-u وَٱلرَّجُلُ wa-'r-rağul", bi-'l-qalam-i بَالرُّعْب bi-'l-qalam', bi-'l-ru`b-i بَالْقَلِ bi-'r-rubi.

Perfect active, imperative, nomen actionis: qAla isma` قَالُ ٱسْمَعْ $qar{a}la$ $^{\prime}sma^{\prime},$ qAla uqtul قَالُ ٱقْتُلُ $qar{a}la$ $^{\prime}qtul,$ huwa inhazama هُوَ ٱنْهُزَمُ huwaأَدُ wa-'stu'mila, qad-i in.sarafa وَٱسْتُعْمَلُ wa-'stu'mila, qad-i al-iqtidāru, 'il_A 'l-inti الأقْتَدارُ qadi 'nṣarafa, al-iqtidAr-u انْصَرَفَ qA.d-i لَو ٱسْتَقْبَلَ lawi 'staqbala إِلَى ٱلاَّتْتَقَاضِ lawi 'staqbala' إِلَى ٱلاَّتْتَقَاضِ

Other cases: 'awi ismu-hu أُو ٱسمه 'awi 'smu-hu, zayduN ibn-u `amriNU زَيْدٌ أَبْنُ عَمْرو $Zayd^{uni}$ ' bn^u ' Amr^{in} , 22 `umar-u ibn-u 'l-_ha.t.tAbi أَنُ اَنْ اَنْ اَنْ اَنْ اَلْعَطَّابِ $Umar^u$ bn^u l- Hatt $\bar{a}b^i, ^{23}$ imru'-u 'l-qays-i اِمْرُوُ الْقَيْس Imru" 'l- $Qays^i$, la-aymun-u 'l-l_ah-i الْقَيْس la- $ymun^u$ 'l- $l\bar{a}h^i$.

'alif" 'l-wasl' preceded by a long vowel The long vowel preceding the connective 'alif is shortened in pronunciation (Wright 1896, i. 21 B-D). This does not appear in the Arabic script, but arabluatex takes it into account in some transliteration standards:-

fI 'l-nAs-i في ٱلنَّاس fi 'n-n $ar{a}s^i$, 'abU 'l-wazIr-i أَبُو ٱلْوُزير أُوْرَير أُوْرَير أَنْ اللهُ اللهُ أَبُو ٱلْوُزير أَنْ اللهُ أَبُو ٱلْوَرْير أَنْ اللهُ اللّهُ اللهُ ا fī 'l-ibtidā'', _dU 'l-i`lAl-i فَى ٱلاَبْتَدَآءِ أَلاَعُلال du $i-il\bar{a}l^i$, maqh_A 'l-'amIr-i مُقهَى الأُمير maqha 'l-' $am\bar{i}r^i$.

'alifu 'l-waşl' preceded by a diphthong The diphthong is resolved into two simple vowels (Wright 1896, i. 21 D-22 A) viz. $ay \rightarrow \check{a}\check{i}$ and $aw \rightarrow \check{a}\check{u}$. arabluatex detects the cases in which this rule applies:—

 $^{^{22}}$ "Zayd is the son of 'Amr": the second noun is not in apposition to the first, but forms part of the predicate. Hence زَيدُ ابنُ عَمِرو and not زَيدُ ابنُ عَمِرو "Zayd, son of 'Amr".

 $^{^{23}}$ "Umar is the son of al-Ḥaṭṭāb" (see note 22).

fī `aynay 'l-malik-i فِي عَيْنِي ٱلْلَاكِ fī ʿaynayi ʾl-malik¹, ix^say 'l-qaw m-a فِي عَيْنِي ٱلْلَاكِ iḫšayi ʾl-qawma, mu.s.tafaw 'l-l_ah-i أُصْطَفَوُ ٱللهِ muṣṭa-fawu ʾl-lāh¹.

ramaW 'l-.hijAraT-a رَمُواُ الْجُارَةُ ramawu 'l-hiğ $\bar{a}rat^a$, fa-lammA ra'aW 'l-najm-a فَلَمَّا رَأُواُ الْنَّجْمَ fa-lamm \bar{a} ra'awu 'n-nağm a .

'alifu' 'l-waṣl' preceded by a consonant with sukūn The vowel which the consonant takes is either its original vowel, or that which belongs to the connective 'alif or the kasrah; in most of the cases (Wright 1896, i. 22 A-C), it is encoded explicitly, like so:—

'antumu 'l-kA_dib-Una أَنْتُمُ ٱلْكَاذِبُونَ 'antumu 'l-kādib
$$\bar{u}^{na}$$
, ra'aytumu 'l-rajul-a مَنِ $ra'aytumu$ 'r-rağula, mani 'l-ka_dab-u مَنِ $mani$ 'l-ka_ddābu, qatalati 'l-rUm-u ٱلكُذَّابُ $mani$ 'l-kaddābu, qatalati 'l-rUm-u ٱلكُذَّابُ

However, the Arabic script does not show the kasrah or the dammah which may be taken by the nouns having $tanw\bar{\imath}n$ although it is explicit in pronunciation and must appear in some transliteration standards. arabluatex takes care of that automatically:—

mu . hammaduN 'l-nabI مُحَدُّ ٱلنَّتِي Muḥammaduni 'n-nabī, salAmuN ud_hulUA مُحَدُّ ٱلنَّتِي $sal\bar{a}m^{unu}$ 'dhul \bar{u} , qa . sIdata-hu fI qatl-i \uc{'a}bI \uc{m} uslimiN 'llatI yaqUlu fI-hA وَصِيدَتَهُ فِي قَتْلِ أَبِي مُسْلِم ٱلَّتِي يَقُولُ فِيهَا $qas\bar{\iota}data-hu$ fī $qatl^i$ ' $Ab\bar{\iota}$ $Muslim^{ini}$ 'llat $\bar{\iota}$ $yaq\bar{\iota}$ lu f $\bar{\iota}$ -h \bar{u} .

4.3 Special orthographies

The name of God The name of God, שׁוֹ, is compounded of the article עַׁן, and עֹׁן (noted עֹּן with the defective 'alif) so that it becomes עֹּן ; then the hamzah is suppressed, its vowel being transferred to the ש before it, so that there remains עֹן (I refer to Lane, Lexicon, I. 83 col. 1). Finally, the first ש is made quiescent and incorporated into the other, hence the tašdīd above it. As arabluatex never requires a solar letter to be written twice (see above, on page 17), the name of God is therefore encoded al-l_ah-u or 'l-l_ah-u:—

The conjunctive الَّذِي Although it is compounded of the article الله , the demonstrative letter ل and the demonstrative pronoun غ , both masculine and feminine forms that are written defectively are encoded alla_dI and allatI respectively. Forms starting with the connective 'alif are encoded 'lla_dI and 'llatI:—

اً خَافُ مِنَ ٱلْمَاكِ 'a_hAfu mina 'l-malik-i 'lla_dI ya.zlimu 'l-nAs-a الَّذِي يَظْلِمُ ٱلنَّاسَ 'ahāfu mina 'l-malik' 'lladī yazlimu 'n-nāsa, `udtu 'l- `say_h-a 'lla_dI huwa marI.duN عُدْتُ ٱلشَّيْخَ ٱلَّذِي هُو مَرِيضٌ 'lladī huwa marīdun عُدْتُ الشَّيْخَ الَّذِي هُو مَرِيضٌ 'lladī huwa marīdun مَا 'lla_dī huwa marīdun أَنَّ بَالَّذِي قَائلُ لَكَ شَيْئًا أَلْكَ شَيْئًا وَ mā 'anā bi-'lla_dī qā'ilun la-ka `say'an.

'ari-nA 'lla_dayni 'a.dallA-nA mina 'l-jinn-i wa-'l-'ins-i أَرِنَا 'ari-na 'lladayni 'aḍallā-nā mina 'l-ǧinn' wa-'l-'ins'.

'ins'.

The other forms are encoded regularly as al-1 or 'l-1:—

fa-'innA na_dkuru 'l-.sawt-ayni 'l-la_dayni rawaynA-humA `an ja.h.zaT-a فَإِنَّا نَذُكُرُ ٱلصَّوْتَيْنِ ٱللَّذَيْنِ رَوَيْنَاهُمَا عَنْ جَعْظَهَ fa-'innā nadkuru 'ṣ-ṣawt ayni 'l-ladayni rawaynā-humā ʿan Ġaḥṣata'.

And also: al-la_dAni اللَّذَيْنِ al-la_dani, al-la_dayni, al-latayni اللَّذَيْنِ al-latani اللَّتَيْنِ al-latayni اللَّتِيْنِ al-latayni, al-latayni, al-latayni اللَّتَيْنِ al-latayni, al-latayni اللَّتَيْنِ al-latayni, al-latayni, al-latı المَّلَى al-latayni, al-latı المَّذَات al-lati اللَّمَان al-lati اللَّمَان al-lati اللَّمَان al-latayni, al-latayn

²⁴Note the "pipe" character '|' here after yA and below after fa before footnote mark 25: it is needed by the dmg transliteration mode as in this mode any vowel at the commencement of a word preceded by a word that ends with a vowel, either short or long, is absorbed by this vowel viz. 'ala 't-ṭarīq'. See section 4.5 on page 24 on the "pipe" and section 8 on page 40 on dmg mode.

²⁵See note 24

²⁶Note here the "pipe" character '|': as already stated on page 16, the sequence 'A usually encodes 'alif with hamzah followed by 'alif of prolongation, which is represented in writing 'alif with maddah: 1. The "pipe" character prevents this rule from being applied. See section 4.5 on page 24.

4.4 Quoting

It is here referred to "quoting" after the arabtex package.²⁷ The "quoting" mechanism of arabluatex is designed to be very similar in effect to the one of arabtex.

To start with an example, suppose one types the following in novoc mode: الحينة; is it أَوْدِ , he was taught the science of astronomy, or عَلَى , he taught the science of astronomy? In order to disambiguate this clause, it may be sensible to put a dammah above the first عَلَى عَلَى الحَيْثَة : وَ which is achieved by "quoting" the vowel u, like so: "ullima, or, with no other vowel than the required u: `"ullm.

This is how the "quoting" mechanism works: metaphorically speaking, it acts as a *toggle switch*. If something, in a given mode, is supposed to be visible, "quoting" hides it; conversely, if it is supposed not to, it makes it visible.

As shown above, "quoting" means inserting one straight double quote (") *before* the letter that is to be acted upon. Its effects depend on the mode which is currently selected, either novoc, voc or fullvoc:—

novoc In this mode, "quoting" essentially means make visible something that ought not to be so.

(a) Quoting a vowel, either short or long, makes the *dammah*, *fatḥah* or *kasrah* appear above the appropriate consonant:—

"ullima `ilm-a 'l-hay'aT-i عُلِّم علم الهيئة 'ullima `ilma 'l-hay'at', ya.gz"UA يغزُوا
$$yagz\bar{u}$$
.

(b) The same applies when "quoting" the tanwin:—

(c) If no vowel follows the straight double quote, then a $suk\bar{u}n$ is put above the preceding consonant:—

qAla isma`" قال اسمع
$$q\bar{a}la$$
 'sma', jA'at" hinduN غنت في $g\bar{a}la$ Hindun, ^sabIhuN bi-man q"u.ti`at" qadamA-hu شبيه بمن قُطعت غماه $\check{s}ab\bar{b}h^{un}$ bi-man quti'at $gadam\bar{a}$ -hu.

(d) At the commencement of a word, the straight double quote is interpreted as `alifu 'l-waşli:—

wa-"ust"u`mila واَستُعمل
$$wa$$
-'stu'mila, huwa "inhazama هو اَنهزم $huwa$ 'nhazama, al-"intiqA.d-u الاُبتقاض al -intiq ad^u .

voc In accordance with the general rule, in this mode, "quoting" makes the vowels and the $tanw\bar{\imath}n$ disappear, should this feature be required for some reason:—

(a) Short and long vowels:—

²⁷See Lagally (2004, p. 22)

q"Ala q"A'iluN قَالَ قَاتِلُ $q\bar{a}la~q\bar{a}'il^{un},$ ibn-u 'abI 'u.saybi`aT-"a اِنُ أَبِي أُصَيبِعَة Ibn^u ' $Ab\bar{\imath}$ ' $Usaybi`at^a$.

(b) *tanwīn*:—

madInaT"aN مُدي $mad\bar{\imath}nat^{an}$, bAb"aN بَابا $b\bar{a}b^{an}$, hud"aN_A مُدي $b\bar{a}b^{an}$, hud"aN_A مُدي $b\bar{a}b^{an}$, hud"aN_A مُدي $b\bar{a}b^{an}$, hud"aN_A مُدي $b\bar{a}b^{an}$

One may more usefully "quote" the initial vowels to write the waslah above the 'alif or insert a straight double quote after a consonant not followed by a vowel to make the $suk\bar{u}n$ appear:—

(a) $alif^u$ 'l-wasl':—

(b) *sukūn*:—

qAla "uqtul" fa-lan tuqtala قَالُ اَقَتُلْ فَلَنِ تَمْقَلَ $q\bar{a}la$ 'qtul fa-lan tuqtala, mA jA'at" mini imra'aTiN مَا جَآءَتْ مِنِ امرَأَة $m\bar{a}$ $g\bar{a}$ 'at mini 'at'in, kam" qad" ma. dat" min" laylaTiN مَنْ قَدْ مَضَتْ مِنْ لَيلَة kam qad madat min laylat in.

fullvoc In this mode, "quoting" can be used to take away any short vowel (or $tanw\bar{\imath}n$, as seen above) or any $suk\bar{\imath}n$:—

al-jamr-u 'l-.sayfiyy-u 'lla_dI kAna bi-q"rAn"|nUn-a اَجْمَرُ ٱلصَّيفِيُّ
$$al$$
-jamr-u ' al -jamr-u ' al -jamr'u ' al -ja

4.4.1 Quoting the hamzah

As said above in section 4.2 on page 15, the *hamzah* is always written $\langle \ ' \rangle$, its carrier being determined by contextual analysis. "Quoting" that straight single quote character like so: $\langle \ '' \ ' \rangle$ allows to determine the carrier of the *hamzah* freely, without any consideration for the context. Table 5 gives the equivalents for all the possible carriers the *hamzah* may take.

Letter	Transliteration ²⁸			ArabT _E X notation
	dmg	loc	arabica	
ç)	,)	" "

Table 5: "Quoted" hamzah

 $^{^{28}\}mathrm{See}$ below section 8 on page 40.

Letter	Tran	slitera	tion	ArabT _E X notation
	dmg	loc	arabica	
ī	ã	'ā	ã	A"'
أ	,	,	,	a"'
ٱ)	,	>	u"'
ؤ)	,	,	W" '
ٳ)	,)	i"'
ئ)	,)	у"'

Table 5: "Quoted" hamzah

As one can see from table 5 on the previous page, the carrier of the hamzah is inferred from the letter that precedes the straight double quote $\langle " \rangle$. Of course, any "quoted" hamzah may take a short vowel, which is to be written after the ArabTEX equivalent for the hamzah itself, namely $\langle " \rangle$. For example, $\dot{\xi}$ is encoded $\langle w" "a \rangle$, while $\dot{\xi}$ is encoded $\langle w" "" \rangle$. In the latter example, the second straight double quote encodes the $suk\bar{u}n$ in voc mode in accordance with the rule laid above on pages 22-23.

'a `dA'ukum أُعُدَّاءَ أُ a' dā a'ukum, 'a `dA|"'ukum أُعُدَّاءَ أُ a' dā a'ukum, 'a `dA'ikum أُعْدَاءَ أُ a' dā a'ikum, 'a `dA|"'ikum أُعْدَاءَ أُ a' dā a'ikum.

4.5 The "pipe" character (|)

In the terminology of ArabTEX, the "pipe" character '|' is referred to as the "invisible consonant". Hence, as already seen above in section 4.4.1 on the preceding page, its usage to encode the *hamzah* alone, with no carrier: |"' ...

Aside from that usage, the "pipe" character is used to prevent almost any of the contextual analysis rules that are described above from being applied. Two examples have already been given to demonstrate how that particular mechanism works in note 24 on page 21 and in note 26 on page 21. One more example follows:—

bi-qrAn | nUn-a بِقْرَانُونُ
$$bi$$
- $Qr\bar{a}nn\bar{u}n^a$, "in Crannon" (Thessaly, Greece). 29

As one can see, the "pipe" character between the two $\langle n \rangle$ prevents the necessary $ta\check{s}d\bar{\iota}d$ rule (page 17) from being applied.

4.6 Putting back on broken contextual analysis rules

In complex documents such as critical editions where footnotes and other kind of annotations can be particularly abundant, the contextual analysis rules that are described above may be broken by LaTeX commands. To take an example, consider the following:—

New feature v1.7

²⁹See more context on the previous page.

```
1 This is wrong:
2 \begin{arab}[fullvoc]
3 fa-lammA ra'aW\LRfootnote{A footnote which interferes with the
4 contextual analysis.} 'l-na^gma...
5 \end{arab}

This is wrong:

"A footnote which interferes with the contextual analysis."
```

According to the rule stated on page 19, the diphthong in $ra \dot{a}w$ must be resolved into two simple vowels before the $\dot{a}lif^u$ $\dot{l}-wasl^i$, as $\dot{\tilde{l}}$

\arbnull

The \arbnull command is provided so as to put back on contextual analysis rules in such situations. It takes as argument the word that must be brought back for any given rule to be applied as it ought to. Depending on the contexts that have to be restored, \arbnull may be found just after or before Arabic words.

In any case, no space must be left after or before the Arabic word that \arbnull is applied to.

The following shows how the Arabic should have been written in the preceding example and gives further illustrations of the same technique:—

```
\begin {arab}[fullvoc]
       fa-lammA ra'aW\arbnull{'l-na^gma}\LRfootnote{A footnote which
2
          interferes with the contextual analysis.} 'l-na^gma...
       \verb|qAla\LR| footnote | A footnote which interferes with the contextual| \\
          analysis.} \arbnull{qAla}uhrub fa-lan tuqtala.
7
       \c\ \uc{z}ayduN\arbnull{ibnu}\LRfootnote{A footnote which
          interferes with the contextual analysis.}
        \arbnull{zayduN}ibn-u \uc{`a}mriNU.\LRfootnote{See
10
11
          \vref{fn:zayd-is-son}.}
12
     \end{arab}
13
14
     \begin{arab}[trans]
       \uc{z}ayduN\arbnull{ibnu}\LRfootnote{A footnote which
15
          interferes with the contextual analysis.}
16
       \arbnull{zayduN}ibn-u \uc{`a}mriNU.\LRfootnote{See
17
18
          \vref{fn:zayd-is-son}.}
     \end{arab}
```

Zaydunie 'bnu 'Amrin.f.

- $^a\mathbf{A}$ footnote which interferes with the contextual analysis.
- ^bA footnote which interferes with the contextual analysis.
- ^cA footnote which interferes with the contextual analysis.
- ^dSee note 22 on page 19.
- ^eA footnote which interferes with the contextual analysis.
- fSee note 22 on page 19.

4.7 Stretching characters: the taṭwīl

A double hyphen $\langle -- \rangle$ stretches the ligature in which one letter is bound to another. Although it is always better to rely on automatic stretching, this technique can be used to a modest extent, especially to increase legibility of letters and diacritics which stand one above the other:—

4.8 Digits

4.8.1 Numerical figures

The *Indian numbers*, *ar-raqam*^u '*l-hindiyy*^u, are ten in number, and they are compounded in exactly the same way as our numerals:—

4.8.2 The abjad

The numbers may also be expressed with letters from right to left arranged in accordance with the order of the Hebrew and Aramaic alphabets (see Wright 1896, i. 28 B-C). The 'abǧad numbers are usually distinguished from the surrounding words by a stroke placed over them.

\abjad

'abğad numbers are inserted with the $\abjad{\langle number\rangle}$ command in any of the voc, fullvoc and novoc modes, where $\langle number\rangle$ may be any number between 1 and 1999, like so:—

\abjad{45} kitAbu-hu fI 'l-`AdAt-i مَه كَأُبُهُ فِي العَادَاتِ $45~kit\bar{a}bu-hu~fi$ 'l-` $adat^i$.

New feature v.1.1

REM. a. As can be seen in the above given example, arabluatex expresses the 'abğad numbers in Roman numerals if it finds the \abjad command in any of the transliteration modes.

REM. b. \abjad may also be found outside Arabic environments. In that case, arabluatex does not print the stroke as a distinctive mark over the number for it is not surrounded by other Arabic words. In case one nonetheless wishes to print the stroke, he can use the \aemph command that is described below in section 4.10 on the next page:—

The \arb[trans] {'abjad} number for 1874 is \abjad{1874} The 'abǧad number for 1874 is .

The \arb[trans]{'abjad} number for 1874 is \aemph*{\abjad{1874}} The 'abjad number for 1874 is \aemph*.

\abjad may also be used to convert values of counters into $`ab\check{g}ad$ numbers, like so:—

```
The \arb[trans]{'ab^gad} number for the current page (\thepage) is \abjad{\thepage}.

The 'abǧad number for the current page (27) is \forall.
```

This technique can be used to produce abjad-numbered lists as will be demonstrated on page 54.

4.9 Additional characters

New feature v1.12

In the manuscripts, the unpointed letters, al-hurūfu 'l-muhmalatu, are sometimes further distinguished from the pointed by various contrivances, as explained in Wright (1896, i. 4 B–C). One may find these letters written in a smaller size below the line, or with a dot or another mark below. As representing all the possible contrivances leads to much complexity and also needs to be agreed among scholars, new ways of encoding them will be proposed and gradually included as arabluatex will mature.

For the time being, the following is included:—

Letter	Transliteration ³⁰			ArabT _E X notation
	dmg	loc	arabica	
ں ۔	þ	b	b	.b
ڊ	đ	d	d	^d
ف	f.	f	f	.f
ق	g	q	q	. q
ک	k	k	k	.k
ں	\dot{n}	n	n	.n
>	(((((
<u></u>)))))

Table 6: Additional Arabic codings

³⁰See below section 8 on page 40.

'afAman.tUs Gal.(M) .fmn.n.ts (sic) Gal.(E1), أفامنطوس (sic) Gal.(E1), أفامنطوس (sic) أفامنطوس

4.10 Arabic emphasis

As already seen in section 4.8.2 on page 26, the 'abğad numbers are distinguished from the surrounding words by a stroke placed over them. This technique is used to distinguish further words that are proper names or book titles.

\aemph

One may use the $\amble Arabic\ text$ } command to use the same technique to emphasize words, like so:—

\abjad{45}: kitAbu-hu \aemph{fI 'l-`AdAt-i} عَلَيْهُ فِي العَادَاتِ
$$45$$
: kitābu-hu fi 'l-ʿĀdāti'.

REM. a. As the above example shows, arabluatex places the horizontal stroke *under* the emphasized words in any of the transliteration modes.

REM. b. \aemph* is also provided should one wish to always have the horizontal stroke printed over the emphasized words, like so: \abjad{45}: kitAbu-hu \aemph*{fI 'l-`AdAt-i} \addition{\overline{fi} \overline{l} \overline{A} \overline{d} \overline{d} \overline{t} \addition{i} \addition{\overline{fi} \overline{l} \overline{A} \overline{d} \overline{t} \overline{t} \addition{i} \overline{t} \o

New feature v1.9.2

\aemph*

5 Arabic poetry

New feature v1.6

arabverse

arabluatex provides a special environment for typesetting Arabic poetry. Every line in this environment must end with \\.

The arabverse environment may take up to six optional 'named arguments' each of which is set using the syntax $\langle key \rangle = \langle value \rangle$, like so:—

```
begin{arabverse}[key1=value1, key2=value2, ...]
```

- 2 <verses>
- 3 \end{arabverse}

The description of the optional arguments follows:—

mode $\mod e \pmod{mode}$, either voc, fullvoc, novoc or trans. The default mode is the one that is set at load time as already seen section 2.2 on page 5.

width width= $\langle length \rangle$

Default: 0.3\linewidth

The default width of each hemistich that the verse consists of. It may be expressed in any accepted unit of measurement, such as 4cm or 2in. However, one must keep in mind that the total length of the two hemistichs added to the one of the gutter that separates them must not exceed the length of the base line, unless one wishes to have the hemistichs distributed on subsequent lines.

gutter

 $gutter=\langle width \rangle$

Default: 0.15 x (hemistich width)

The gutter consists of the blank space that is between the two hemistichs. By default, it is commensurate with the width of the hemistich, but it may be expressed in any accepted unit of measurement as well.

metre

 $metre = \langle name \rangle$

Default: none

If the name of the metre is expressed, it is printed after the lines and set flush left in voc, fullvoc and novoc modes or flush right in trans mode.

This named argument does not need a value as it defaults to true if it is used. If

delim

delim=true|false

utf=true|false

Default: false

\SetHemistichDelim

so, a delimiter is printed between each of the hemistichs. By default, it is set to the 'star' character '*'. The $SetHemistichDelim{\langle delimiter \rangle}$ command may be used

at any point of the document to change this default setting.

Default: false

As the preceding one, this named argument does not need a value as it defaults to true if it is used. If so, Unicode Arabic input is expected in the arabverse environment instead of ASCII ArabTEX or Buckwalter input schemes. See section 10 on page 48 for more details.

color

export

New feature v1.13

New feature

v.1.13

utf

 $color = \langle color \ name \rangle$

Default: not set

The color in which lines of poetry are to be rendered.

export=true|false

Default: false

This named argument does not need a value as it defaults to true if it is used. If export is set as a global option as well (see above on page 6), all the lines will be converted to Unicode and exported to the external selected file. See below section 12 on page 58 for more details.

\bayt

Inside the arabverse environment, each line is typeset by the \bayt command which takes two mandatory arguments and may accept one optional argument.³¹ Additionally, every \bayt command must be followed with \\ like so:—

```
\begin{tabular}{l} \begin{tabular}{l} \begin{tabular}{l} \aligned \begin{tabular}{l}
```

That two subsequent hemistichs should be connected with one another is technically named $tadw\bar{\imath}r$. Should that happen, either the sadr or the 'ağuz or both of them, may be connected to one another by letters that are naturally bound to the following or the preceding ones over the tadwir. The optional argument of the \bayt command is designed to deal with the various situations that may arise:-

(a) If the two hemistichs be connected with one another by a prominent horizontal flexible stroke, the $tatw\bar{\imath}l$ should be used, like so: [--] (see section 4.7 on page 26). Of course, the ending word of the sadr and the word at the commencement of the 'ağuz must have the $tatw\bar{\imath}l$ too so that the proper shapes of the letters be selected. Consider for example the following:—

```
\begin {arabverse}[mode=fullvoc, width=.3\linewidth]
     \bayt{lA 'ar_A man `ahidtu fI-hA fa-'abkI
2
       '1---}[--]{---yawma
       dalhaN wa-mA yaruddu 'l-bukA'u}\\
   \end{arabverse}
```

³¹A 'starred' version \bayt* is also defined. arabluatex uses it internally when export is set to true to instruct some Lua functions that lines of poetry have already been processed. That aside, \bayt and \bayt* do the same, and only \bayt should be used.

لَا أَرَى مَنْ عَهِدْتُ فِيهَا فَأَبْكِي ٱلْــــــيَوْمَ دَلْمًا وَمَا يَرُدُّ ٱلْبُكَآءُ

As one can see, *triple hyphens* have been used. In the sadr, the first hyphen triggers the rules that are related to the definite article and the $lalif^u$ $l-wasl^i$, $lalif^u$ while the following two select the figure of the letter $l\bar{a}m$ connected with a following letter. In the $lalif^u$ two hyphens select the letter $y\bar{a}$ connected with a preceding letter, while the first one is simply discarded in this mode, but still may appear as it should, if the trans mode be selected:—

```
| begin {arabverse}[mode=trans, width=.4\linewidth]
| bayt{lA 'ar_A man `ahidtu fI-hA fa-'abkI
| 'l---}[--]{---yawma
| dalhaN wa-mA yaruddu 'l-bukA'u}\\
| end{arabverse}
| la 'ara man 'ahidtu fi-ha fa-'abki 'l- -yawma dalham wa-ma yaruddu 'l-buka'u
```

(b) In some other cases, it may seem difficult, if not fairly impossible, to split a given word into two parts. This happens mostly because of the *šaddah*. Consider for example the following:—

```
| \begin {arabverse} [mode=fullvoc, width=.25\linewidth, gutter=1cm]
| \bayt{.gayra 'annI qad 'asta`Inu `al_A 'l-ha--}[--mmi ] {'i_dA
| haffa bi-'l-_tawiyyi 'l-na^gA'u}\\
| \bayt{bi-zaf--UfiN ka-'anna-hA hiq--laTuN}[ 'ummu ] {ri'AliN dawwiyyaTuN saqfA'u}\\
| \begin {arabverse}
```

In the first line, the word is should be split into as the first part of it belongs to the sadr and the second to the $a\check{g}uz$. One solution to avoid splitting this word in such a way is to write inside the $tadw\bar{\imath}r$ the part of it that belongs to either hemistich, without omitting to add a space after it. In the second line,

 $^{^{32}\}mathrm{See}$ section 4.2 on page 18

the word \hat{j} should be split into \hat{j} , so that the only way to avoid splitting it into two parts is to write it all inside the $tadw\bar{\imath}r$. In that case, as the word is to be placed in the middle, it has been surrounded by spaces.

Scaling and distortion of characters The arabverse environment and the \bayt command are designed to typeset the verses in a two-column, fixed width layout. This may result in a somewhat distorted text. Should that happen, one may adapt the layout by modifying the values of the above described width and gutter named arguments until the visual aspect of the layout be satisfactory. It has to be noted that distortion and warping may be even more perceptible in Roman than in Arabic characters.

Footnotes Footnotes are not set by default inside the \bayt command, but there are two easy ways to have them printed.

If they are little in number, each footnote may be split into pairs of \footnote mark{} (please mind the braces or "declare" footnotemark using \MkArbBreak to take it out of the Arabic environment³³) in the argument of the \bayt command and \footnotetext outside the \bayt command.

If the footnotes are abundant in number, it is advised to load the footnotehyper package which arabluatex will then use to typeset any kind of footnote that is called from the arguments of the \bayt command.³⁴

Line numbering Inside the arabverse environment, the linenumbers environment of the lineno package can be used to have the lines of succeeding verses numbered. Please refer to the documentation of this package for more information or to the example below for a basic implementation of this technique.

5.1 Example

Here follow the first lines of Imru'u 'l-Qaysi's Mu'allaqah. In this example, \SetArbDflt* has been selected so as to mark the 'idġām that is fit to this declamatory poetry:— 35

```
begin{arab}[fullvoc]
qAla \uc{i}mru'u 'l-\uc{q}aysi fI mu`allaqati-hi:
  \end{arab}

begin{arabverse}[mode=fullvoc, metre={(al-.darbu 'l-_tAnI mina 'l-`arU.di 'l-'_Ul_A mina 'l-.tawIli)}]
```

 $^{^{33}}$ See section 11.1 on page 51.

³⁴The footnote package can also be used for the same effect. However, it must be loaded *after* arabluates

 $^{^{35}}$ Please note that for the time being only the assimilation rules that are laid on item (b) on page 17 are applied. See section 2.2.1 on page 6 for more information. None of the editions of the $Mu'allaq\bar{a}t$ that I know of feature the $idg\bar{a}m$ in the Arabic text, although it is often strongly marked in declamation.

```

6 Special applications

Linguistics The same horizontal stroke as the $ta\underline{t}w\overline{\iota}l$ (see section 4.7 on page 26) may be encoded $\langle B \rangle$; $\langle BB \rangle$ will receive the $ta\underline{s}d\overline{\iota}d$. This is useful to make linguistic annotations and comments on vowels:—

Brackets The various bracket symbols are useful in technical documents such as critical editions for indicating that some words or some letters must be added or removed. arabluatex will automatically fit those symbols to the direction of the text. For the time being, the following symbols are supported:

- parentheses: ()square brackets: []angle brackets: <>
- braces: {}

\abraces

Parentheses, square and angle brackets may be input directly at the keyboard; however, words or letters that are to be read between braces must be passed as arguments to the \abraces command:—

```
    \begin {arab}
    \abraces{wa-qAla} 'inna 'abI kAna mina 'l-muqAtilaTi
    wa-kAna--<--t> 'ummI min `u.zamA'i buyUti 'l-zamAzimaTi.
    \end{arab}

(end{arab}
```

Additional Arabic marks In addition to common letters, many symbols and ligatures are encoded in Arabic Unicode standard, such as honorifies consisting of complex ligatures, and annotation signs used in the $Qur\bar{a}n$ or in classical poetry.

\arbmark

 $\arbmark[\langle rl|lr\rangle]$ { $\langle shorthand\rangle$ } can be used to insert such characters either in Unicode or in romanized Arabic environments. It takes as argument a shorthand defined beforehand in a default list which consists of the following at the time of writing:—

Codepoint	Shorthand	Glyph	Transliteration
FDFD	bismillah	<u>ٳٞ</u> ڷڷٙۅۛٲڷڗؖٞۿٙڔ <u>ؖٲڷڗؖڿؠ</u>	bi-'smi 'Llāhi 'r- rahmāni 'r-rahīmi
FDF5	salam	صلعم	şalla 'Llāhu 'alay-hi wa- sallama

Table 7: Additional Arabic marks

New feature v1.11

New feature

v1.4.3

Codepoint	Shorthand	Glyph	Transliteration
FDFA	slm	غَالِيَّةِ مُحَالِيًّا	ṣalla ʾLlāhu ʿalay-hi wa-
			sallama
FDFB	jalla	<u>بَالْخ</u>	ğalla ğalāla-hu

Table 7: Additional Arabic marks

New feature v1.13

\newarbmark

New feature v1.11

The mark to be inserted is determined by contextual analysis, or by an optional argument, either rl to have the Arabic glyph printed, or lr to print the tranliterated equivalent.

\newarbmark is also provided should one wish to define new marks in addition to the marks defined above. This command takes three arguments, like so:—

As regards the right-to-left codepoint, it may be either typed in Unicode or selected as Unicode codepoint. To that end, the LATEX command \symbol{"XYZT} or its plain TEX variant \char"XYZT\relax may be used, where XYZT are uppercase hex digits (0 to 9 or A to F).

It is also possible to use the so-called 'non notation' like so: ____xyzt , where xyzt are lowercase hex digits (0 to 9 or a to f).

As regards the third argument (left-to-right rendition), it may be either left empty or typed by means of $\arb[trans]{\langle arabtex\ code\rangle}$ so as to have it printed in romanized Arabic.

It must be noted that \newarbmark expects ArabTEX input scheme inside \arb[trans]{} to the exclusion of buckwalter input scheme.

The example below provides an implementation of this technique. It may be observed that \arbcolor is used so as to have the marks printed in red:—

```
\newarbmark{sly}{\arbcolor[red]{^^^^06d6}}{}
2
     \newarbmark{jim}{\arbcolor[red]{^^^06da}}{}
     \begin{arab}
       sUraTu 'l-nisA'i, 19:
     \end{arab}
7
     \begin{center}
       \begin{arab}
         \arbmark{bismillah}
9
       \end{arab}
10
     \end{center}
     \begin{arab}[fullvoc]
13
       y_a'ayyuhA 'lla_dIna 'a'manUA lA ya.hillu la-kum 'an tari_tUA
       'l-nisA'a karhaN\arbmark{sly} wa-lA ta`.dulU-hunna li-ta_dhabUA
14
       bi-ba`.di mA 'a'taytumU-hunna 'illA 'an ya'tIna bi-fA.hi^saTiN
15
```

6.1 The Qur'an

This sub-part is destined to become a part of its own, as fine typesetting of Qur'ānic text is planned in the versions of arabluatex to come in the medium-term. New functions and new Arabic modes will be available as arabluatex will mature.

\ayah

For the time being, $\agah{\agaah}{\agaah}{\agaah}{\agaah}$ is provided so as to typeset the number of the $\ddot{a}yah$ that it is referred to inside the dedicated mark—Unicode U+06DD: —in Arabic script or inside parentheses in romanized Arabic:—

 $\ayah{123} \iff (123).$

An example follows:—

```
\SetArbDflt *
     \newarbmark{alifsp}{^^^0627}{\arb[trans]{'alif} }
     \newarbmark{lamsp}{^^^0644^^^0653}{\arb[trans]{lAm} }
     \begin{arab}[fullvoc]
      min ((sUraTi \uc{'l-b}aqaraTi)):
     \end{arab}
     \begin{arab}[fullvoc]
      \arbmark{alifsp}\arbmark{lamsp}\arbmark{mim}~\ayah{1}
       _d_alika 'l-kit_abu lA rayba fI-hi hudaN_A
10
      li-l-muttaqIna~\ayah{2} 'lla_dIna yu'minUna bi-'l-.gaybi
11
      wa-yuqImUna 'l-.sal_aUTa wa-mimmA razaqn_a-hum
12
      yunfiqUna~\ayah{3}
13
     \end{arab}
14
```

New feature v1.15

min (sūrati 'l-Baqarati):
'alif lām mīm (1) dālika 'l-kitābu lā rayba fī-hi huda li-l-muttaqīna (2)
'lladīna yu'minūna bi-'l-jaybi wa-yuqīmūna 'ṣ-ṣalāta wa-mimmā
razaqnā-hum yunfiqūna (3)

Caveat For some reason, most of the Arabic fonts do not show the number properly: some are only able to display at most two digits, while others display the digits outside the 'end of ' $\bar{a}yah$ ' sign, let alone those that print the digits stacked. To the knowledge of the writer, this should be reported to the developpers of those fonts.

7 Color

\arbcolor

arabluatex is able to render in color either words, parts of words or diacritics. As the techniques implemented in this section may lead to some complexity, the reader should first become well acquainted with the following points: ³⁶—

- (a) The "pipe" character (|, section 4.5 on page 24);
- (b) 'Quoting' technique (section 4.4 on page 22), and more specifically 'quoting the *hamzah*' (on page 23);
- (c) Putting back on broken contextual analysis rules (section 4.6 on page 24);
- (d) Arabic marks (section 6 on page 33).

\arbcolor takes the text to be colored into $\langle color \rangle$ as an argument:—

 $\arbcolor[\langle color \rangle] \{\langle Arabic\ text \rangle\}$

```
\begin {arab}
\arbcolor[red]{al-bAbu 'l-_hAmisu} fI .tabaqAti 'l-'a.tibbA'i

'lla_dIna kAnUA mun_du zamAni \uc{^gAlInUsa} wa-qarIbaN

min-hu. \arbcolor[red]{\uc{^gAlInUsu}}: wa-li-na.da` 'awwalaN

kalAmaN kulliyyaN fI 'a_hbAri \uc{^gAlInUsa} wa-mA kAna

`alay-hi...

\end{arab}

begin{arab}[trans]

\arbcolor[red]{al-bAbu 'l-_hAmisu} fI .tabaqAti 'l-'a.tibbA'i

'lla_dIna kAnUA mun_du zamAni \uc{^gAlInUsa} wa-qarIbaN
```

New feature v1.12

 $^{^{36}}$ Regarding the colors themselves and the way new colors can be defined in addition to those that are already available, please refer to the xcolor package.

```
min-hu. \arbcolor[red]{\uc{^gAlInUsu}}: wa-li-na.da` 'awwalaN kalAmaN kulliyyaN fI 'a_hbAri \uc{^gAlInUsa} wa-mA kAna `alay-hi...

\text{Alay-hi...}

\text{Variable}

\text{Va
```

As this example shows, \arbcolor has been used to render headings in red with the same encoding both in vocalized and in romanized Arabic. The same technique also applies to syllabes inside words. arabluatex takes care of selecting the appropriate shape of the letters while coloring them:—

'voc' mode:

```
i ^stara\arbcolor [brown] {y}tu-hu bi-_tama\arbcolor [red] {niN} 'a `\arbcolor [blue] {^ga}ba-ka اِشْتَرَيْتُهُ بِغُنْنِ أُعِبَكُ ištaraytu-hu\ bi-\underline{tama-n^{in}} 'a'\check{y}aba-ka.
```

'fullvoc' mode:

```
i ^stara\arbcolor [brown] {y}tu-hu bi-_tama\arbcolor [red] {niN} 'a `\arbcolor [blue] {^ga}ba-ka لِشْتَرَيَّهُ بِعُنُو أَعْبَكُ ištaraytu-hu\ bi-\underline{tama-n^{in}} 'a \check{g}aba-ka.
```

7.1 Tricks of the trade

Diacritics Depending on the mode selected, either voc, novoc or fullvoc, coloring the diacritics requires more attention for the insertion of \arbcolor may prevent contextual analysis from being applied.

Furthermore, depending on the surrounding letters, the standard encoding of short vowels $\langle u, a, i \rangle$ may result either in diacritics or in a connective 'alif with the waṣlah or its accompanying vowel. As for the $suk\bar{u}n$, it is generated by contextual analysis. Thus applying colors to bare diacritics requires them to have specific encodings.

Table 8 gives the ArabTeX equivalents for the diacritics to be printed inside or just after \arbcolor.

Diacritic	Transliteration ³⁷			ArabT _E X notation
	dmg	loc	arabica	
-	a	a	a	.a
-	u	u	u	.u
-	i	i	i	.i
۰				0

Table 8: ArabTEX diacritics for \arbcolor

The following examples show how the letters, or the diacritics above or under them or both the letters and the diacritics can be rendered in different colors:—

'voc' mode:

```
i ^staraytu-hu bi – taman \arbcolor [red] {i N} 'a ` ^g \arbcolor [red] {. a} ba-ka وَ الْمَتْرَيُّهُ بِمُّنِ أُعْبَكُ i \check{s} taraytu-hu \ bi-\underline{t} aman^{in} 'a '\check{g} aba-ka.
```

i ^staraytu-hu bi - _tama \arbcolor [red] {n} i N 'a `\arbcolor [red] { ^g} . aba-ka الشّرَيُّهُ بِثُنِ أُعِبَكُ ištaraytu-hu bi-taman in 'a 'ǧaba-ka.

i ^staraytu-hu bi-_tama\arbcolor[red] {n}\arbcolor[blue] {iN} 'a `\arbcolor[red] { ^g}\arbcolor[blue] {.a}ba-ka الشَّرَيْتُهُ بِغُنِ أَعْجَبُكُ ištaraytu-hu bi-taman in 'a'ğaba-ka.

'fullvoc' mode:

i^staray"\arbcolor[red] {0}tu-hu bi-_taman"\arbcolor[red] {iN} 'a`^g"\arbcolor[red] {.a}ba-ka اِشْتَرَيْتُهُ بِمُّنِ أُعْجِبَكُ ištaraytu-hu bi-taman in 'a 'ğaba-ka.

i ^stara\arbcolor[red] {y"}otu-hu bi-_tama\arbcolor[red] {n"}iN 'a `\arbcolor[red] {^g"} . aba-ka الشُّرَيَّةُ بِمُّنٍ أُعْبَكُ ištaraytu-hu $bi-\underline{taman}^{in}$ 'a ' $\ddot{a}aba-ka$.

i ^stara\arbcolor [red] {y"}\arbcolor [blue] {o}tu-hu bi-_tama\arb color [red] {n"}\arbcolor [blue] {iN} 'a `\arbcolor [red] {^g"}\arb color [blue] {.a}ba-ka (شُتَرُ يَّهُ بِغُنِ أُعْبَكُ ištaraytu-hu bi-taman in `a 'ğaba-ka.

As can be seen, fullvoc required the letters y, n and \hat{g} before \hat{g} before to be 'quoted'. Otherwise, unwanted $\hat{suk\bar{u}ns}$ would have been generated because of the absence of a vowel after those consonants.

³⁷See below section 8 on page 40.

 $tanwin \ \$ \arbnull must be used with $fathat\bar{a}n$ (\dot{a}) so as to put back on contextual analysis rules:—

```
mu`allim\arbcolor[red] {\arbnull{m}aN} مُعَلِّنا mu`allim^{an}, istisqA'\arbcolor[red] {\arbnull{A'}aN} istisq\bar{a} istisq\bar{a}
```

REM. Note that in the last example $(\check{g}\bar{a}mi'at^{an})$, the 'pipe' character has been inserted before \arbcolor. Otherwise, the dmg mode of the transliteration rules would have interpreted the $t\bar{a}^i$ marb $\bar{u}tah$ as final (e.g. h instead of the expected t).

The $tanw\bar{n}$ preceding a ω conveys even more intricate business to the rendering with the utmost accuracy in both romanized and non-romanized modes. First, a new Arabic mark needs to be defined. It should print ω in Arabic script and not a thing in transliteration. It is to be appended after \arbcolor, like so:—

```
\newarbmark {Y}{^^^0649}{}
\arb{\hud\arbcolor[red]{aN\arbnull{_A}}\arbmark{Y}}
\arb[trans]{\hud\arbcolor[red]{aN\arbnull{_A}}\arbmark{Y}}

\huda^n
```

waṣlah and maddah Both can be generated with the help of \arbnull:—

```
wa-\arbcolor[red] {\arbnull{wa}i}stisqA'uN وَٱسْتِسْفَآءُ wa-'stisqā'un³9.
```

fI "al".i-\arbcolor[red]{\arbnull{'l-}i}btidA'i فِي ٱلْإِنْبِدَآء
$$fi~'ii-'btid\bar{a}~i$$
.

The Unicode codepoint of the *maddah* is 0653, while bare 'alif is 0627. So:—

```
\newarbmark {alifmaddahred}{^^^0627\arbcolor[red]{^^^0653}}%

{\arb[trans]{\arbcolor[red]{'a'\arbnull{k}}}}

arb{\arbmark{alifmaddahred}kulu}

arb[trans]{\arbmark{alifmaddahred}kulu}.
```

آکُل 'ākulu.

REM. In the preceding example, any consonant could have been passed as argument to the \arbnull command.

 $^{^{38}}$ See also on page 44 "Discarding the $iir\bar{a}b$ " for more information.

 $^{^{39}}$ To the knowledge of the writer, the *waṣlah* alone is not part of the Arabic Unicode block.

šaddah In the following example, it is assumed that the šaddah above the letter لَا أَلْعُلُونَ أَلْ al-mu'allimūna, is to be rendered in red. Thus the Arabic mark must generate the šaddah alone—of which the Unicode codepoint is 0651—in Arabic script and the letter 'l' in transliteration:—

```
1 \newarbmark {\lamshaddah}{^^^0651}{\lamshaddah}}.imUna}
2 \arb[fullvoc]{al-mu`al"\arbcolor[red]{\arbmark{\lamshaddah}}.imUna}
3 \arb[trans]{al-mu`al"\arbcolor[red]{\arbmark{\lamshaddah}}.imUna}.
```

The definite article and the euphonic tašdīd The intricate business of rendering in color the initial 'alif al-waṣl of the definite article followed by a solar consonant must be unraveled.

From the examples provided above, in fI 'l-nAsi فِي ٱلنَّاسِ fi 'n-nāsi, the initial 'alif'' 'l-waṣl' can be rendered in red like so: \arbcolor[red] {\arbnull{al-}a} . Then, the following two letters, namely l-n, must print the string $l\bar{a}m + n\bar{u}n + \check{s}addh$ in Arabic, and exactly n-n in transliteration. Thus an Arabic mark is needed:—

```
\newarbmark {\lnn}{^^^0644^^^0651}{\n-n}
\arb[fullvoc]{fI\arbnull{al-}}
\arbcolor[red]{\arbnull{al-}a}\arbmark{\lnn}Asi}
\arb[trans]{fI\arbnull{al-}}
\arbcolor[red]{\arbnull{al-}a}\arbmark{\lnn}Asi}.
```

hamzah The 'quoting' technique provides an easy way to determine the carrier of the *hamzah*, as shown in table 5 on page 23—:

```
yatasA\arbnull{'a}\arbcolor[red]{|""}.alUna يَّسَآ عَلُونَ yatasā ʾa-lūna, ^say\arbcolor[red]{|""}\arbnull{'}an شَيْعً šay ʾan, ^say\arbcolor[red]{|""}in شَيْعِ šay ʾin, \arbcolor[red]{a""}.as\arbcolor [red]{y""}.ilaTuN أُسْبَلُمُ ʾas ʾilatun.
```

8 Transliteration

It may be more appropriate to speak of "romanization" than "transliteration" of Arabic. As seen above in section 2.2 on pages 5–9, the "transliteration mode" may be selected globally or locally.

This mode transliterates the ArabTEX input into one of the accepted standards. As said above on page 6, three standards are supported at present:

dmg Deutsche Morgenländische Gesellschaft, which was adopted by the International Convention of Orientalist Scholars in Rome in 1935.⁴⁰ dmg transliteration convention is selected by default;

loc Library of Congress: this standard is part of a large set of standards for romanization of non-roman scripts adopted by the American Library Association and the Library of Congress;⁴¹

arabica Journal of Arabic and Islamic Studies/Revue d'études arabes et islamiques: this standard is most widely used by scholars in the field of Arabic studies. 42

More standards will be included in future releases of arabluatex.

\SetTranslitConvention

Convention The transliteration mode, which is set to dmg by default, may be changed at any point of the document by the \SetTranslitConvention{ $\langle mode \rangle$ } command, where $\langle mode \rangle$ may be either dmg, loc or arabica. This command is also accepted in the preamble should one wish to set the transliteration mode globally, e.g.:—

- 1 \usepackage{arabluatex}
- 2 \SetTranslitConvention{loc}

\SetTranslitStyle

Style Any transliterated Arabic text is printed in italics by default. This also can be changed either globally in the preamble or locally at any point of the document by the $\texttt{SetTranslitStyle}\{\langle style \rangle\}$ command, where $\langle style \rangle$ may be any font shape selection command, e.g. \upshape, \itshape, \slshape, and so forth.

New feature v1.4

New feature

v1.8

\SetTranslitFont

\11C

Font $\ensuremath{\mbox{\sc Font }\mbox{\sc SetTranslitFont}(\ensuremath{\sc font selection \ command})}$}$ allows any specific font to be selected for rendering transliterated text with the font-selecting commands of the fontspec or luaotfload package. Of course, this font must have been defined properly. To take one example, here is how the $Gentium\ Plus$ font can be used for rendering transliterated text:—

- newfontfamily\translitfont{Gentium Plus}[Ligatures=TeX]
- 2 \SetTranslitFont{\translitfont}

Proper names Proper names or book titles that must have their first letters up-

⁴⁰See Brockelmann et al. (1935).

⁴¹See http://www.loc.gov/catdir/cpso/roman.html for the source document concerning Arabic language.

⁴²See http://www.brill.nl/files/brill.nl/specific/authors_instructions/ARAB.pdf.

percased may be passed as arguments to the \c (\c word)} command. \c is a clever command, for it will give the definite article al- in lower case in all positions. Moreover, if the inital letter, apart from the article, cannot be uppercased, viz. 'or ', the letter next to it will be uppercased:—

```
\uc{.hunayn-u} bn-u \uc{'is.h_aq-a} مَنْينُ بنُ إِسَىٰ Hunayn^u bn^u Ish\bar{a}q^a, \uc{`u_tm_an-u} مُشْنُ Utm\bar{a}n^u, .daraba \uc{zayd-u} bn-u \uc{_h_alidiN} \uc{sa`d-a} bn-a \uc{`awf-i} bn-i \uc{`abd-i} \uc{'1-1_ah-i} مَرْبُ زُيْدُ بُنْ عُوْفَ بْنِ عَبْدُ اللهِ daraba\ Zayd^u\ bn^u H\bar{a}lid^{in}\ Sa'd^a\ bn^a' Awf^i\ bn^i' Abd^i' Llah^i.
```

However, \uc must be used cautiously in some very particular cases, for the closing brace of its argument may prevent a rule from being applied. To take an example, as seen above on page 20, the transliteration of must be $Muhammad^{uni}$ 'n- $nab\bar{\imath}$, as nouns having the $tanw\bar{\imath}n$ take a kasrah in pronunciation before 'alifu 'l-wasli. In that case, encoding will like so: \uc{mu.hammaduN} is wrong, because the closing brace would prevent arabluatex from detecting the sequence $\langle -uN \rangle$ immediately followed by $\langle l - \rangle$. Fortunately, this can be circumvented in a straightforward way by inserting only part of the noun in the argument of \uc vz. up to the first letter that is to be uppercased, like so: \uc{m}u.hammaduN.

Hyphenation In case transliterated Arabic words break the TEX hyphenation algorithm, one may use the \- command to insert discretionary hyphens. This command will be discarded in all of the Arabic modes of arabluatex, but will be processed by any of the transliteration modes:—

```
\uc{'abU} \uc{bakriN} \uc{mu\-.ham\-madu} bnu \uc{za\-ka \-riy\-yA'a} \uc{'1-rAziyyu} أَبُو بَرِ مُحُمَّدُ بَنُ زَكِرِيَّآ ءَ الرَّازِيُّ Ab\bar{u} Bakr^{in} Mu-hammad^u bn^u Zakariyu\bar{a} 'r-R\bar{a}ziyyu.
```

'Long' proper names \uc is also able to process proper names consisting of several subsequent words:—

```
\arb[trans]{\uc{'abU zaydiN .hunaynu bnu 'is.h_aqa 'l-`ibAdiyyu}} 
'Abū Zayd'n Ḥunaynu bnu 'Ishāqa 'l-Tbādiyyu.
```

\prname

Proper names outside Arabic environments Transliterated proper names inserted in paragraphs of English text should be printed in the same typeface as the surrounding text. $\proper name \$ is provided to that effect: 43 —

```
1 From \textcite[i. 23 C]{Wright}:--- If the name following
```

^{2 \}arb[fullvoc]{ibnuN} be that of the mother or the grandfather, the

⁴³ Just as \uc, \prname is also able to process proper names consisting of several subsequent words.

```
\arb[fullvoc]{"a} is retained; as \arb[fullvoc]{`Is_A ibnu maryama},
\enquote{Jesus the son of Mary}; \arb[fullvoc]{`ammAru ibnu man.sUriN}, \enquote{\prname{`ammAr} the (grand)son of \prname{man.sUr}}.

From Wright (1896, i. 23 C):— If the name following أَنُ لُ فَعَ اللهُ لَهُ اللهُ اللهُ لَهُ اللهُ ال
```

The following example shows how $\proxspace{1mm}\p$

\prname*

New feature v1.3

REM. arabluatex also provides \prname* which only renders in upright roman style already transliterated proper names without applying any further processing. It is mostly used internally and applied to proper names exported in Unicode to an external selected file. 45

8.1 Additional note on dmg convention

According to Brockelmann et al. (1935, p. 6), Arabic irab may be rendered into dmg in three different ways:

(a) In full: 'Amrun;

Hunayn, ar-Rāzī.

- (b) As superscript text: Amr^{un} ;
- (c) Discarded: Amr.

Varbup By default, arabluatex applies rule (b). Once delimited by a set of Lua functions, $iir\bar{a}b$ is passed as an argument on to a \arbup command which is set to \textsuperscript.

⁴⁴ See the documentation of nameauth for more details: https://ctan.org/pkg/nameauth

 $^{^{45}\}mathrm{See}$ below section 12 on page 58 for more details.

\NoArbUp \ArbUpDflt \NoArbUp may be used either in the preamble or at any point of the document in case one wishes to apply rule (a). The default rule (b) can be set back with \ArbUpDflt at any point of the document.

\SetArbUp

Finally, $\SetArbUp\{\langle formatting\ directives\rangle\}\$ can be used to customize the way $i'r\bar{a}b$ is displayed. To take one example, here is how Arabic $i'r\bar{a}b$ may be rendered as subscript text:—

```
\SetArbUp {\textsubscript{#1}}
```

- 2 Arabic |dmg| transliteration for \arb{ra'aytu ^gAmi`aN
- muhaddamaTaN mi'_danatu-hu}: \arb[trans]{ra'aytu
- 4 ^gAmi`aN muhaddamaTaN mi'_danatu-hu.}

Arabic dmg transliteration for مُدَّنَةُ مِئذَنَةُ مِئذَنَةُ مَئذَنَةُ ra'aytu $yar{a}mi'_{an}$ $muhaddamat_{an}$ $mi'\underline{d}anatu-hu$.

As shown in the above example, #1 is the token that is replaced with the actual $tanw\bar{\imath}n$ in the formatting directives of the \SetArbUp command.

'i'rāb boundaries Every declinable noun (mu'rab) may be declined either with or without $tanw\bar{\imath}n$, viz. $mun\bar{\imath}arif^{un}$ or $\dot{g}ayr^u$ $mun\bar{\imath}arif^{in}$. The former is automatically parsed by arabluatex, whereas the latter has to be delimited with an hyphen, like so:—

munṣarif: mu`allimuN مُعَالِّمُ mu`allimun, kA'inuN كَا بَنُ $k\bar{a}$ 'inun, kA'inAtuN مُعَالِّمُ $k\bar{a}$ 'inatun, \uc{`amraNU} عَرَّوا {Amr}^{an}, fataN_A كَا ثَنَاتُ $q\bar{a}di^n$.

ġayr munṣarif: al-mu`allim-u َالْعُلِّرُ al-muʿallim'', kitAb-Ani اَلُعُلِّرُ $kit\bar{a}b^{\bar{a}ni}$, ra`sa'-Ani مَارِقُونَ $s\bar{a}riq^{\bar{u}na}$, qA . d-Una مَارِقُونَ $q\bar{a}d^{\bar{u}na}$, al-. zulm-Atu مَارِقُونَ az-zulm at-.

REM. a. As the $tanw\bar{\imath}n$ is passed over in pronunciation when it is followed by the letters \jmath , \jmath , \jmath , \jmath , \jmath , (see item (b) on page 17), it may be desirable to further distinguish it by putting it above the line, but not to do the same for $jayr\ munsarif$ terminations. This can be achieved by simply omitting the hyphen before any $jayr\ munsarif$ termination:—

kAna .ganiyyaN l_akinna-hu labisa ^gubbaTaN mumazzaqaN 'aydu-hA كَانَ غَنِيًّا لِكِتَهُ كَبِسَ جُبَّةٌ مُحْرَقًا كَانَ غَنِيًّا لِكِتَهُ كِبِسَ جُبَّةٌ مُحْرَقًا kāna ġaniyyan lākinna-hu labisa ǧubbatan mumazzaqan ʾaydu-hā.

REM. b. Although the hyphen before the $tanw\bar{n}$ is optional as arabluatex always parses nouns with such termination, it may also be used to mark better the inflectional endings:—

mana`a 'l-nAs-a kAffaT-aN min mu_hA.tabati-hi 'a.had-uN bi-sayyidi-nA خُاطَبَتُه أَحَدُ بِسَيِّدِنَا

mana`a 'n-nāsa kāffatan min muḥāṭabati-hi 'aḥadun bi-sayyidi-nā.

Discarding the 'i'rāb As said above (item (c) on page 43), the 'i'rāb may be discarded in some cases, as in transliterated proper names or book titles. arabluatex is able to render words ending with $t\bar{a}$ ' $marb\bar{u}th$ in different ways, depending on their function:—

- (a) Nouns followed by an adjective in apposition: madInaT kabIraT $mad\bar{\imath}nah$ $kab\bar{\imath}rah$, al-madInaT al-kabIraT $al-mad\bar{\imath}nah$ $al-kab\bar{\imath}rah$.
- (b) Nouns followed by another noun in the genitive (contruct state): .hikmaT all_ah $hikmat \ All \bar{a}h$, fi.d.daT al-darAhim $fiddat \ ad$ -dar $\bar{a}him$.

REM. It may so happen, as in the absence of the article before the annexed word, that arabluatex be unable to determine which of the above two cases the word ending with $t\bar{a}$ 'marb \bar{u} tah falls into. The 'pipe' character (see section 4.5 on page 24) may be appended to that word to indicate that what follows is in the construct state: \c^{r} isAlaT fI tartIb qirA'aT| kutub \c^{g} AlInUs $Ris\bar{u}$ lah $f\bar{v}$ tart \bar{u} b gir \bar{u} at kutub gir \bar{u} b.

Uncertain short vowels In some printed books, it may happen that more than one short vowel be placed on a consonant in cases where the vocalization is uncertain or ambiguous, like so:
i. In transliteration, the uncertain vowels go between slashes and are separated by commas: fa`uaila
ifa`uaila

8.2 Examples

Here follows in transliteration the story of $\check{G}uh\bar{a}$ and his donkey (\hat{a}). See the code on page 8:—

'dmg' standard: 'atā ṣadīqu" 'ilā Ğuḥā yaṭlubu min-hu ḥimāra-hu li-yarkaba-hu fī safratin qaṣīratin fa-qāla la-hu: "sawfa 'uʿīdu-hu 'ilay-ka fi 'l-masā'i wa-'adfa'u la-ka 'uǧrat^{an}." fa-qāla Ğuḥā: "anā 'āsif^{un} ǧidd^{an} 'annī lā 'astaṭī'u 'an 'uḥaqqiqa la-ka raġbata-ka fa-'l-ḥimār" laysa huna 'l-yawma." wa-qabla 'an yutimma Ğuḥā kalāma-hu bada'a 'l-ḥimār" yanhaqu fī 'iṣṭabli-hi. fa-qāla la-hu ṣadīqu-hu: "innī 'asma'u ḥimāra-ka yā Ğuḥā yanhaqu." fa-qāla la-hu Ğuḥā: "ġarīb^{un} 'amru-ka yā ṣadīqī 'a-tuṣaddiqu 'l-ḥimār" wa-tukaddiba-nī?"

'arabica' standard: atā ṣadīqun ilā Ğuḥā yaṭlubu min-hu ḥimāra-hu li-yarkaba-hu fī safratin qaṣīratin fa-qāla la-hu: "sawfa uʿīdu-hu ilay-ka fī l-masā'i wa-adfa'u la-ka uǧratan." fa-qāla Ğuḥā: "anā āsifun ǧiddan annī lā astaṭī'u an uḥaqqiqa la-ka raġbata-ka fa-l-ḥimāru laysa hunā l-yawma." wa-qabla an yutimma Ğuḥā kalāma-hu bada'a l-ḥimāru yanhaqu fī iṣṭabli-hi. fa-qāla la-hu ṣadīqu-hu: "innī asma'u ḥimāra-ka yā Ğuḥā yanhaqu." fa-qāla la-hu Ğuḥā: "ġarībun amru-ka yā ṣadīqī a-tuṣaddiqu l-ḥimāra wa-tukaddiba-nī?"

9 Buckwalter input scheme

New feature v1.4

\SetInputScheme

Even though arabluatex is primarily designed to process the ArabTEX notation, it can also process the Buckwalter input scheme to a large extent. The Buckwalter scheme is actually processed in two steps, as it is first converted into ArabTEX. Then, once this is accomplished, the ArabTEX scheme is processed through the above described functions. In this way, the Buckwalter input scheme can make the most of the arabluatex special features that are presented in section 2.2 on page 5.

The input scheme, which is set to arabtex by default, may be changed at any point of the document by the $SetInputScheme{\langle scheme \rangle}$ command, where $\langle scheme \rangle$ may be either arabtex or buckwalter. This command is also accepted in the preamble should one wish to set the input scheme globally, like so:—

- 1 \usepackage{arabluatex}
- 2 \SetInputScheme{buckwalter}

'base', 'xml' and 'safe' schemes arabluatex can use any of the so-called Buckwalter 'base', 'xml' or 'safe' schemes as they are described in Habash (2010, pp. 25–26). 47 However, the following limitation apply to the 'base' and 'xml' schemes: the braces { and }, which are used to encode i and ; must be replaced with square brackets viz. [and] respectively.

It is therefore recommended to use the Buckwalter 'safe' scheme.

Table 9 gives the Buckwalter equivalents that are currently used by arabluatex. The additional characters that are defined in table 6 on page 27 are also available.

Letter	Transliteration ⁴⁸			Buckwalter notation

Table 9: Buckwalter scheme

Transliteration The Buckwalter notation can also be transliterated into any accepted romanization standard of Arabic. See above section 8 on page 40 for more information. However, it should be pointed out again that only accurate coding produces accurate transliteration. It is therefore at the very least highly advisable to use the hyphen for tying the definite article and the inseparable particles (viz. prepositions, adverbs and conjunctions) to words, like so:—

Similary, it is not advisable to use | and [('base' and 'xml' schemes) or M and L ('safe' scheme) to encode the 'alif' 'l-mamdūdat' and the 'alif' 'l-waṣl' for such signs are supposed to be generated by arabluatex internal functions. Besides, as they do not per se convey any morphological information on what they are derived from, they cannot be transliterated accurately. To take one example, <ily Al-IntiqaADi gives أَلَى الْاَنتَعَانِ as expected, but only <ily Al-intiqADi can be transliterated as 'ila 'l-intiqādi with the correct vowel (i) in place of the 'alif' 'l-waṣl'.

10 Unicode Arabic input

As said above in section 9 on page 46 about the Buckwalter input scheme, even though arabluatex is primarily designed to process the ArabTEX notation, it also accepts Unicode Arabic input. It should be noted that arabluatex does in no way interfere with Unicode Arabic input: none of the voc, fullvoc, novoc or trans options will have any effect on plain Unicode Arabic for the time being.

That said, there are two ways of inserting Unicode Arabic:

\txarb

New feature v1.5

(a) The \txarb{\langle Unicode Arabic\rangle} command for inserting Unicode Arabic text in paragraphs;

txarab

(b) The txarab environment for inserting running paragraphs of Arabic text, like so:—

```
1 \begin{txarab}
```

- 3 \end{txarab}

48

11 LATEX Commands in Arabic environments

General principle IATEX commands are accepted in Arabic environments. The general principle which applies is that any single-argument command with up to two optional arguments—that is: $\command[\langle opt1\rangle][\langle opt2\rangle]\{\langle arg\rangle\}$ —such as $\ensuremath{\command}\{\langle text\rangle\}$, $\ensuremath{\command}$ and the like, is assumed to have Arabic text in its mandatory argument:—

```
\abjad{45} kitAbu-hu \emph{fI 'l-\uc{`AdAt-i}} المَادَاتِ 45 45 kit\bar{a}bu-hu fi 'l-'Ad\bar{a}t^i. 49 \arb{\abjad{45} \rlframebox[1in][s]{kitAbu-hu fI 'l-`AdAti}} \\ \arb{\deltajad} \\ \arb{\deltaj} \
```

The same applies to footnotes:—

```
\renewcommand {\footnoterule}%
{ \hfill\noindent\rule[1mm]{.4\textwidth}{.15mm}}
\text{begin{arab}
\display 'inna 'abI kAna mina 'l-muqAtilaT-i\footnote{al-muqAtilaT-i:
al-muqAtil-Ina.}, wa-kAnat 'ummI min `u.zamA'-i buyUt-i
\display 'l-zamAzimaT-i\footnote{al-zamAzimaT-u: .tA'ifaT-u mina
\display 'l-furs-i.}.
\text{end{arab}}
\display \displ
```

Some commands, however, do not expect running text in their arguments, or one may wish to insert English text e.g. in footnotes or in marginal notes. arabluatex provides a set of commands to handle such cases.

\LR{ $\langle arg \rangle$ } is designed to typeset its argument from left to right. It may be used in an Arabic environment, either \arb{ $\langle Arabic\ text \rangle$ } or \begin{arab} $\langle Arabic\ text \rangle$ \end{arab}, for short insertions of left-to-right text, or to insert any LaTeX command that would otherwise be rejected by arabluatex, such as commands the argument of which is expected to be a dimension or a unit of measurement.

 $\RL\{\langle arg \rangle\}\$ does the same as $\LR\{\langle arg \rangle\}\$, but typesets its argument from right to left. Even in an Arabic environment, this command may be useful.

\LRfootnote{ $\langle text \rangle$ } and \RLfootnote{ $\langle text \rangle$ } typeset left-to-right and right-

\LRfootnote \RLfootnote

\LR

\RL

⁴⁹This is odd in Arabic script, but using such features as \emph or \textbf is a matter of personal taste.

⁵⁰\rlframefox has been adapted from \framebox for insertions of right-to-left text.

to-left footnotes respectively in Arabic environments. Unlike $\{\text{dext}\}\$, the arguments of both \LRfootnote and \RLfootnote are not expected to be Arabic text. For example, \LRfootnote can be used to insert English footnotes in running Arabic text:—

```
\begin {arab}[fullvoc]
\uc{z}ayd-uN\arbnull{ibnu}\LRfootnote{%
\enquote{\arb[trans]{\uc{z}ayd} is the son of
\arb[trans]{\uc{a}mr}}: the second noun is not in
apposition to the first, but forms part of the
predicate\ldots} \arbnull{zayduN}ibn-u \uc{a}mr-iNU
\end{arab}

\[
\arbnu{arab}
\]

\[
\archnu{arab}
\]

\[
\archnu{arab}
\]
```

When footnotes are typeset from right to left, it may happen that the numbers of the footnotes that are at the bottom of the page be typeset in the wrong direction. For example, instead of an expected number 18, one may get 81. arabluatex is not responsible for that, but should it happen, it may be necessary to redefine in the preamble the LATEX macro \thefootnote like so:—

\renewcommand*{\thefootnote}{\textsuperscript{\LR{\arabic{footnote}}}}

\FixArbFtnmk

Another solution is to put in the preamble, below the line that loads arabluatex, the \FixArbFtnmk command. However, for more control over the layout of footnotes marks, it is advisable to use the scrextend package.⁵¹

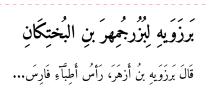

\LRmarginpar

The \LRmarginpar[$\langle left \rangle$] { $\langle right \rangle$ } command does for marginal notes the same as \LRfootnote does for footnotes. Of course, it is supposed to be used in Arabic environments. Note that \marginpar also works in Arabic environments, but it acts as any other single-argument command inserted in Arabic environments. The general principle laid on the previous page applies.

\setRL \setLR \setRL and \setLR can be used to change the direction of paragraphs, either form left to right or from right to left. As an example, an easy way to typeset a right-to-left sectional title follows:—

```
1 \setRL
2 \section*{\arb{barzawayhi li-buzurjumihra bn-i 'l-buxtikAni}}
3 \setLR
4 \begin{arab}
5 qAla barzawayhi bn-u 'azhar-a, ra's-u 'a.tibbA'-i fAris-a...
6 \end{arab}
```

⁵¹See http://ctan.org/pkg/koma-script; read the documentation of KOMA-script for details about the \deffootnotemark and \deffootnote commands.

11.1 New commands

New feature v1.9

In some particular cases, it may be useful to define new commands to be inserted in Arabic environments. From the general principle laid on page 49, it follows that any command that is found inside an Arabic environment is assumed to have Arabic text in its argument which arabluatex will process as such before passing it on to the command itself for any further processing. As a result of this feature, such a command as:

```
\newcommand{\fvarabic}[1]{\arb[fullvoc]{#1}}
```

will work as expected, but will always output non-vocalized Arabic if it is inserted in a novoc Arabic environment because its argument will have been processed by the novoc rules before the command \fvarabic itself can see it.

\MkArbBreak

The $\MkArbBreak{\langle csv\ list\ of\ commands\rangle}$ command can be used in the preamble to give any command—either new or already existing—the precedence over arabluatex inside Arabic environments. It takes as argument a comma-separated list of commands each of which must be stripped of its leading character \n , like so:—

```
\MkArbBreak{onecmd, anothercmd, yetanothercmd, ...}
```

For example, here follows a way to define a new command \fvred to distinguish words with a different color and always print them in fully vocalized Arabic:—

```
\MkArbBreak {fvred}
\newcommand{\fvred} [1] {\arbcolor[red] {\arb[fullvoc] {\#1}}}
\begin{arab} [voc]

tumma "intalaqa _dU 'l-qarn-ayni 'il_A 'ummaT-iN 'u_hr_A fI \fvred{((ma.tli`-i 'l-^sams-i))} wa-lA binA'-a la-hum

yu'amminu-hum mina 'l-^sams-i.

hend{arab}
```

It must be noted that the arguments, either optional or mandatory, of commands declared with \MkArbBreak are not to be processed by arabluatex. Therefore, as in the previous example, any of their argument to be rendered in Arabic must be inserted again in \arb. These commands themselves may have up to two optional and/or mandatory arguments followed by one optional argument, like so:—

- (a) \command (no argument, lowermost combination)
- (b) $\command[\langle opt1 \rangle]$ (one optional argument)

New feature v1.12

- (c) $\command{\langle arg1\rangle}$ (one mandatory argument)
- (d) $\command[\langle opt1\rangle] \{\langle arg1\rangle\}\$ (one optional and one mandatory argument)
- (e) [...]
- (f) $\command[\langle opt1\rangle][\langle opt2\rangle]\{\langle arg1\rangle\}\{\langle arg2\rangle\}$
- (g) $\command[\langle opt1\rangle][\langle opt2\rangle]\{\langle arg1\rangle\}\{\langle arg2\rangle\}[\langle opt3\rangle]$ (uppermost combination)

\MkArbBreak*

New feature v1.12

New feature v1.5

As said above, \MkArbBreak prevents arabluatex from processing the arguments of 'declared' commands as Arabic text. This technique proves sufficient in most cases. However, a 'starred' version of this command—\MkArbBreak*{ $\langle csv \ list \ of \ commands \rangle}$ —is also provided. It goes a step further, as it directs arabluatex to close the current Arabic environment before any of the 'declared' commands, then resume it just after.

It must be noted that \MkArbBreak* must be used with the utmost care and should never be used if \MkArbBreak gives satisfaction. At any rate, the latter must always be tested before the former.

11.2 Environments

Environments such as \begin{quote}... \end{quote} may be nested inside the arab environment. Up to one optional argument may be passed to each nested environment, like so:—

```
begin{arab}
begin{<environment>}[<options>]

Arabic text>
hend{<environment>}

end{arab}
```

In the following example, the quoting package is used:—

```
\setquotestyle {arabic}
     \begin{arab}[fullvoc]

11.2.1 Lists

Lists environments are also accepted inside the arab environment. One may either use any of the three standard list environments, viz. itemize, enumerate and description or use packages that provide additional refinements such as paralist or enumitem.

To take a first example, should one wish to typeset a list of manuscripts, the description environment can be used like so:—

```
| \setRL \paragraph{\arb[novoc]{rumUzi 'l-kitAbi}}\setLR |
| \begin{arab}[novoc] |
| \begin{description} |
| \item[b] max.tU.tu 'l-maktabaTi 'l-'ahliyyaTi bi-\uc{bArIs} 2860 |
| `arabiyyuN. |
| \item[s] max.tU.tu 'l-maktabaTi 'l-'ahliyyaTi bi-\uc{bArIs} 2859 |
| `arabiyyuN. |
| \item[m] max.tU.tu majlisi \arb[novoc]{^sUrAY malY} .tahrAna |
| 521. |
| \end{description} \end{description} |
| \end{arab} |
| \end{arab} |
| \text{vode} \t
```

As a second example, the contents of a treatise may be typeset with the standard list environments, like so:—

```
\setRL \centerline{\arb{\textbf{al-qAnUnu fI 'l-.tibbi}}}\setLR
        \begin{arab}
2
           \begin{itemize}
3
           \item \textbf{al-fannu 'l-'awwalu} fI .haddi 'l-.tibbi
              wa-maw.dU`Ati-hi mina 'l-'umUri 'l-.tabl`iyyaTi wa-ya^stamilu
              `al_A sittaTi ta`AlImiN
6
              \begin{itemize}
7
                 \item \textbf{al-ta`lImu 'l-'awwalu} [wa-huwa fa.slAni]
8
9
                    \begin{itemize}
                    \item \textbf{al-fa.slu 'l-'awwalu}
10
                    \end{itemize}
11
              \end{itemize}
           \end{itemize}
        \end{arab}
                 القَانُونُ فِي الطِّبِّ وَمُوضُوعَاتِهِ مِنَ الأُمُورِ الطَّبِيعِيَّةِ وَيَشْتَمِلُ عَلَى سِتَّةِ تَعَالِمٍ

- اَلْفَنُّ الأُوَّلُ فِي حَدِّ الطِّبِّ وَمُوضُوعَاتِهِ مِنَ الأُمُورِ الطَّبِيعِيَّةِ وَيَشْتَمِلُ عَلَى سِتَّةِ تَعَالِمٍ

- اَلْتَعْلِيمُ الأُوَّلُ الْأَوْلُ

- اَلْفَصْلُ الأُوَّلُ
14
```

As a third example, abjad-numbered lists can be typeset in conjunction with the enumitem package, ⁵² like so:—

```
% preamble:---
% \understand \underst
```

 $^{^{52}\}mathrm{See}$ the documentation of enumitem for more details: https://ctan.org/pkg/enumitem

```
\item fA`ala
          \item 'af`ala
          \item tafa``ala
13
          \item tafA`ala
14
          \item infa`ala
15
          \item ifta`ala
16
          \item if`alla
17
          \item istaf`ala
          \item if`Alla
19
          \item if`aw`ala
20
          \item if`awwala
21
          \item if`anlala
22
          \item if anl_A
23
          \end{enumabjad}
24
        \end{arab}
25
      \end{multicols}
```

From Wright (1896, i. 29 B–C):— The derived forms of the triliteral verb are usually reckoned fifteen in number, but the learner may pass over the last four, because (with the exception of the twelfth) they are of very rare occurrence.

Caveat The various French definition files of the babel package viz. acadian, canadien, francais, frenchb or french all redefine the list environments, which breaks the standard definition file that is used by arabluatex. Therefore, babel-french must be loaded with the StandardLists=true option, like so:—

```
1 \usepackage[french]{babel}
2 \frenchsetup{StandardLists=true}
```

This option will prevent babel-french from interfering with the layout of the document. Then the paralist or enumitem packages can be used to make the lists 'compact' as babel-french do.

11.3 csquotes

The recommended way of inserting quotation marks in running Arabic text is to use csquotes. With the help of the \DeclareQuoteStyle command, one can define an Arabic style, like so:—

```
\usepackage{csquotes}
\usepackage{csquo
```

Then, use this newly defined style with \setquotestyle, like so:—

```
ا \setquotestyle {arabic}
ا \begin{arab}
a fa-qAla la-hu ju.hA: \enquote{.garIb-uN 'amru-ka yA .sadIqI
ا 'a-tu.saddiqu 'l-.himAr-a wa-tuka_d_diba-nI?}
ا \end{arab}
ا \setquotestyle{english}
ا \setquotestyle{english}
```

Rem. Do not forget to set back the quoting style to its initial state once the Arabic environment is closed. See the last line in the code above.

11.4 Two-argument special commands

textcolor The two-argument command $\textcolor{\langle color \rangle} {\langle Arabic\ text \rangle}$ is supported inside $\begin{arab} ... \end{arab}$. One simple example follows: 53 —

```
\begin {arab}
     \textcolor{red}{\uc{m}uha_d_dabu \uc{'l-d}Ini \uc{`a}bdu
2
       \uc{'l-r}a.hImi bnu \uc{`a}liyyiN} huwa ^say_hu-nA 'l-'imAmu
3
     'l-.sadru 'l-kabIru 'l-`Alimu 'l-fA.dilu \uc{m}uha_d_dabu
     \uc{'l-d}Ini \uc{'a}bU \uc{m}u.hammadiN \uc{`a}bdu
     \uc{'l-r}a.hImi bnu \uc{`a}liyyi bni \uc{.h}AmidiN wa-yu`rafu
     bi-\uc{'l-d}a_hwari.
   \end{arab}
   \begin{arab}[trans]
     \textcolor{red}{\uc{m}uha_d_dabu \uc{'l-d}Ini \uc{`a}bdu
10
       \uc{'l-r}a.hImi bnu \uc{`a}liyyiN} huwa ^say_hu-nA 'l-'imAmu
     'l-.sadru 'l-kabIru 'l-`Alimu 'l-fA.dilu \uc{m}uha_d_dabu
     \uc{'l-d}Ini \uc{'a}bU \uc{m}u.hammadiN \uc{`a}bdu
     \uc{'l-r}a.hImi bnu \uc{`a}liyyi bni \uc{.h}AmidiN wa-yu`rafu
14
```

⁵³ arabluatex provides its own \arbcolor command which is able to render syllabes or diacritics in colors. See section 7 on page 36.

```
15 bi-\uc{'l-d}a_hwari.
16 \end{arab}
```

Muhaddabu 'd-Dīni 'Abdu 'r-Raḥīmi bnu 'Aliyyⁱⁿ huwa šayhu-na 'limāmu 'ṣ-ṣadru 'l-kabīru 'l-ʿālimu 'l-ṭādilu Muhaddabu 'd-Dīni 'Abū Muḥammadⁱⁿ 'Abdu 'r-Raḥīmi bnu 'Aliyyi bni Ḥāmidⁱⁿ wa-yuʿrafu bi-'d-Dahwari.

reledmac The two-argument command $\ensuremath{\mbox{\mbox{$\sim$}}} \{\langle commands \rangle\} \}$ is supported inside $\ensuremath{\mbox{\mbox{\mbox{\sim}}}} ... \ensuremath{\mbox{\mbox{\sim}}} ... \ensuremath{\mbox{\sim}} ... \ensuremath{\$

```
beginnumbering
pstart
begin{arab}
wa-ya.sIru ta.hta 'l-jild-i
bedtext{\arb{.sadId-uN}}{\Afootnote{M: \arb{.sadId-aN} E1}}
end{arab}
pend
endnumbering
```

11.5 quran

arabluatex is compatible with the quran package so that both can be used in conjunction with one another for typesetting the $Qur'\bar{a}n$. As quran draws the text of the $Qur'\bar{a}n$ from a Unicode encoded database, its commands have to be passed as arguments to the \tanh txarb command for short insertions in left-to-right paragraphs, or inserted inside the txarab environment for typesetting running paragraphs of $Qur'\bar{a}nic$ text (see above section 10 on page 48 for more details). Please note that arabluatex takes care of formatting the Arabic: therefore, it is recommended to load the quran package with the nopar option, after arabluatex itself has been loaded, like so:—

```
\usepackage{arabluatex}
usepackage[nopar]{quran}
```

As an example, the following code will typeset the sūrat al-Fātiḥah:—

⁵⁴\pstart and \pend are also supported inside the arab environment.

- 1 \begin {txarab}
 2 \quransurah[1]
- \end{txarab}

بِسِمِ اللَّهِ الرَّحْمِنِ الرَّحْمِ ﴿١﴾ الحَمُدُ لِلَّهِ رَبِّ العالمَينَ ﴿٢﴾ الرَّحْمِنِ الرَّحْمِ ﴿٣﴾ مالِكِ يَومِ الدّينِ ﴿٤﴾ إِيّاكَ نَعَبُدُ وَإِيّاكَ نَسَتَعينُ ﴿٥﴾ اهدِنَا الصِّراطَ المُستَقيمَ ﴿٦﴾ صِراطَ الَّذينَ أَنعَمتَ عَلَيْهِم غَيرِ المَغضوبِ عَلَيْهِم وَلَا الضَّالِّينَ ﴿٧﴾

12 Exporting Unicode Arabic to an external file

arabluatex is able to produce a duplicate of the original .tex source file in which all arabtex or buckwalter strings will have been replaced with Unicode equivalents, either in Arabic script or in any accepted standard of transliteration. Exporting ASCII strings to Unicode while preserving the exact selected global or local options is a fairly complex operation which may require Lual*TeX to be run several times as will be explained below.

12.1 Commands and environments

export

New feature v.1.13

export global option $\,$ First, arabluatex must be loaded with the export global option enabled, 55 like so:—

- 1 % preamble
- 2 \usepackage[export]{arabluatex}
- 2 % or
- 4 \usepackage[export=true]{arabluatex}

Once that is done, compiling the current file will produce a new empty external .tex file with the same preamble as the original file.

\SetArbOutSuffix

By default, _out is appended as a suffix to the external file name. Any other suffix may be set with the command \SetArbOutSuffix{suffix} .

arabexport

Exporting running paragraphs Then, the arabexport environment is provided to actually exporting running paragraphs with or without Arabic environments to the external selected file, like so:—

- 1 \begin{arabexport}
- <Running paragraphs of either Arabic or non-Arabic text>
- 3 \end{arabexport}

⁵⁵See above on page 6 for more information.

arabluatex converts to Unicode and writes to the external file what is found inside Arabic environments. As to non-Arabic text, it is appended untouched to this file, which is formatted as follows:—

(a) Unicode Arabic text, either in Arabic script or in transliteration, is inserted as argument of \txarb⁵⁶ or \txtrans⁵⁷ accordingly.

\arbpardir

(b) Additionally, Arabic paragraphs may receive \arbpardir, which arabluatex uses to determine the direction of Arabic paragraphs to be set by default, or either \setRL or \setLR depending on what may have been set locally.⁵⁸

\prname*

(c) Proper names are inserted as arguments of \prname*.⁵⁹

\ArbOutFile \ArbOutFile* Appending words or commands to the external file only \ArbOutFile[$\langle newline \rangle$] { $\langle argument \rangle$ } silently exports its argument to the external file. It may take the string newline as an optional argument, in which case a carriage return is appended to the contents of the argument. \ArbOutFile*[$\langle newline \rangle$] { $\langle argument \rangle$ } does the same as \ArbOutFile, but also inserts its argument into the current .tex source file.

Exporting Arabic poetry Lines of Arabic poetry are exported as described above on page 29 when the export option that is specific to the arabverse environment is set to true. As a result of this particular feature, arabverse environments must be left outside \begin{arabexport} ... \end{arabexport}.

Please note that inside arabverse environments \bayt is replaced with \bayt*.60

12.2 Nested Arabic environments

The exporting mechanism described above converts only the outermost level of nested Arabic environments. This may be sufficient in some cases, but if nested Arabic environments be found in the original .tex source file, then the Unicode converted file must be opened and compiled in turn, and so on until the innermost Arabic environment be converted and exported. In such cases, arabluatex issues a warning, so that authors do not have to check the entire file that just has been exported:—

- Package arabluatex Warning: There are still 'arabtex' strings
- to be converted. Please open <jobname><suffix>.tex and compile
- it one more time.

Where $\langle jobname \rangle$ is the name of the original .tex source file, and $\langle suffix \rangle$ the suffix appended to the file that is to be opened and compiled again.

⁵⁶See above section 10 on page 48.

⁵⁷\txtrans is used internally by several Lua functions to format transliterated Arabic. Therefore, it is not documented.

⁵⁸See above on page 50.

⁵⁹See above on page 43.

⁶⁰See above note 31 on page 29 for more information.

12.3 Further processing of Unicode converted files

Unicode files can be further processed by document converters such as John McFarlane's pandoc⁶¹. To take here one simple example, here is how file_out.tex can be converted from Lual*TFX into Open Document format (.odt):—

```
pandoc file_out.tex -s -o file_out.odt
```

However, specific commands such as \txarb, \txtrans or \prname*, which are not known to pandoc, must be redefined explicitly in the preamble to prevent the converter from gobbling their arguments, like so:—

13 Future work

A short, uncommented, list of what is planned in the versions of arabluatex to come follows:

- (a) Short-term:
 - i. TEI xml support: arabluatex will interoperate with TEI xml through new global and local options that will output Arabic in a TEI xml compliant file in addition to the usual PDF output: see on page 4.
- (b) Medium-term:
 - i. More languages: the list of supported languages will eventually be the same as arabtex: see note 4 on page 4.
 - ii. Formulate propositions for extending the ArabTEX notation and the transliteration tables. Include them in arabluatex. See section 4.9 on page 27.

14 Implementation

The most important part of arabluatex relies on Lua functions and tables. Read the .lua files that accompany arabluatex for more information.

1 \NeedsTeXFormat{LaTeX2e}

⁶¹ See http://pandoc.org/

```
2 \ProvidesPackage{arabluatex}%
 3 [2018/10/11 v1.15.1 An ArabTeX-like interface for LuaLaTeX]
 4 \RequirePackage{ifluatex}
arabluatex requires LuaLATEX of course. Issue a warning if the document is pro-
cessed with another engine.
 5\ifluatex\else
 6 \PackageError{arabluatex}{lualatex needed}{%
    Package `arabluatex' needs LuaTeX.\MessageBreak
    So you should use `lualatex' to process your document.\MessageBreak
    See documentation of `arabluatex' for further information.}%
10 \expandafter\expandafter\csname endinput\endcsname
11\fi
Declare the global options, and define them:
12 \RequirePackage{xkeyval}
13 \DeclareOptionX{voc}{\def\al@mode{voc}}
14 \DeclareOptionX{fullvoc}{\def\al@mode{fullvoc}}
15 \DeclareOptionX{novoc}{\def\al@mode{novoc}}
16 \DeclareOptionX{trans}{\def\al@mode{trans}}
17 \define@boolkey{arabluatex.sty}[@pkg@]{export}[true]{%
18
    \if@pkg@export%
19
    \AtBeginDocument{\luadirect{al_openstream()}%
20
       \MkArbBreak{@al@ob,@al@cb,@al@cb@sp}}
21 \AtEndDocument{\luadirect{al_closestream()}}
22 \leq fi
23 \ExecuteOptionsX{voc}
24 \ProcessOptionsX\relax
25 \def\al@mode@voc{voc}
26 \def\al@mode@fullvoc{fullvoc}
27 \def\al@mode@novoc{novoc}
28 \def\al@mode@trans{trans}
Packages that are required by arabluatex:
29 \RequirePackage{xcolor}
30 \RequirePackage{luacolor}
31 \RequirePackage{etoolbox}
32 \RequirePackage{arabluatex-patch}
33 \RequirePackage{fontspec}
34 \RequirePackage{amsmath}
35 \RequirePackage{luacode}
36 \RequirePackage{xparse}
37 \RequirePackage{environ}
38 \RequirePackage{adjustbox}
39 \RequirePackage{xstring}
The following boolean will be set to true in RL mode:
40 \newbool{al@rlmode}
Here begins the real work: load arabluatex.lua:
41 \luadirect{dofile(kpse.find_file("arabluatex.lua"))}
```

Font setup. If no Arabic font is selected, issue a warning message and attempt to load the Amiri font which is included in TeXlive:

```
42 \AtBeginDocument{\ifdefined\arabicfont\relax\else
43 \PackageWarning{arabluatex}{\string\arabicfont\ is not defined.^^J
44 I will try to load Amiri}%
45 \newfontfamily\arabicfont[Script=Arabic]{Amiri}\fi}%
```

\setRL This neutralizes what may be defined by other packages:

```
46 \AtBeginDocument{\def\setRL{\booltrue{al@rlmode}\pardir TRT\textdir TRT}}
```

\setLR The same applies to \setLR:

```
47 \AtBeginDocument{\def\setLR{\boolfalse{al@rlmode}\pardir TLT\textdir TLT}}
```

\LR This command typesets its argument from left to right. As \LR may be already defined, we need to redefine for it to suit our purpose:

```
48 \AtBeginDocument{\ifdef{\LR}%
```

- 49 {\RenewDocumentCommand{\LR}{m}{\bgroup\textdir TLT\rmfamily#1\egroup}}
- 50 {\NewDocumentCommand{\LR}{m}{\bgroup\textdir TLT\rmfamily#1\egroup}}}

\RL This one typesets its argument from right to left. Same remark as above regarding the need of redefinition.

```
51 \AtBeginDocument{\ifdef{\RL}%
```

- 52 {\RenewDocumentCommand{\RL}{m}{\bgroup\textdir TRT\rmfamily#1\egroup}}
- 53 {\NewDocumentCommand{\RL}{m}{\bgroup\textdir TRT#1\rmfamily\egroup}}}

\MkArbBreak The \MkArbBreak{\(\langle csv \ list \ of commands \rangle\)} command can be used to give any command—either new or already existing—the precedence over arabluatex inside Arabic environments. It is actually coded in Lua.

\MkArbBreak* goes a step further as it directs arabluatex to close the current Arabic environment before processing any 'declared' command then resume it just after.

```
54 \NewDocumentCommand{\MkArbBreak}{s m}{%
55 \IfBooleanTF{#1}
56 {\luadirect{mkarbbreak(\luastringN{#2}, "out")}}
57 {\luadirect{mkarbbreak(\luastringN{#2}, "dflt")}}
58}
```

\aemph Arabic emphasis. Needs to be redefined as well. The function is actually coded in Lua.

\aemph* The 'starred' version of this command alway puts the stroke over its argument.

 $\arbcolor \arbcolor \arbcolor\arbcolor \arbcolor \arbcolor \arbcolor \arbcolor \arbcolor \arbc$

- 68 \NewDocumentCommand{\arbcolor}{o m}{%
- \IfNoValueTF{#1}{#2}{\textcolor{#1}{#2}}}

\SetInputScheme

arabluatex is designed for processing ArabTFX input notation. \SetInputScheme may be used in the preamble or at any point of the document should the user wish to use a different notation such as the 'Buckwalter scheme'.

- 70 \def\al@input@scheme{arabtex}
- $\label{lem:command} $$71 \NewDocumentCommand{\SetInputScheme}_{m}_{\cline{10}} $$$

\SetArbEasy \SetArbEasy*

By default, arabluatex applies complex rules to generate euphonic tašdīd, 'alif $mand\bar{u}dah$ and $suk\bar{u}n$ depending on the modes which are selected, either voc, \SetArbDflt fullvoc or trans. Such refinements can be discarded with \SetArbEasy, either globally in the preamble or at any point of the document. Note that \SetArbEasy keeps the $suk\bar{u}n$ that is generated, while the starred version \SetArbEasy* takes it away. Default complex rules can be set back at any point of the document with \SetArbDflt.

\SetArbDflt*

As of v1.6, arabluatex does not applies any more the assimilation rules that are laid on item (b) on page 17; a new starred version \SetArbDflt* is now available to the user should he wish to apply them.

- 72 \def\al@arb@rules{dflt}
- 73 \NewDocumentCommand{\SetArbEasy}{s}{%
- 74 \IfBooleanTF{#1}
- 75 {\def\al@arb@rules{easynosukun}}
- 76 {\def\al@arb@rules{easy}}}
- 77 \NewDocumentCommand{\SetArbDflt}{s}{%
- 78 \IfBooleanTF{#1}
- 79 {\def\al@arb@rules{idgham}}
- 80 {\def\al@arb@rules{dflt}}}

\SetTranslitFont

By default, the font that is used for transliterated text is the main font of the document. Any other font may also be selected with the font-selecting commands of the fontspec package.

- 81 \def\al@trans@font{\rmfamily}%
- 82 \NewDocumentCommand{\SetTranslitFont}{m}{\def\al@trans@font{#1}}

\SetTranslitStyle

By default any transliterated Arabic text is printed in italics. This can be changed either globally in the preamble or at any point of the document:

- 83 \def\al@trans@style{\itshape}%
- 84 \NewDocumentCommand{\SetTranslitStyle}{m}{\def\al@trans@style{#1}}

\SetTranslitConvention

 $\mathsf{SetTranslitConvention}$ can be used to change the transliteration convention, which is dmg by default:

- 85 \def\al@trans@convention{dmg}

\arbup \NoArbUp \ArbUpDflt \SetArbUp

By default, \arbup is set to \textsuperscript. This is how the $tanw\bar{\imath}n$ that takes place at the end of a word should be displayed in dmg mode. \NoArbUp may be used either in the preamble or at any point of the document in case one wishes to have the $tanw\bar{\imath}n$ on the line. The default rule can be set back with \ArbUpDflt at any point of the document. Finally \SetArbUp can be used to customize the way $tanw\bar{\imath}n$ is displayed: this command takes the formatting directives as argument, like so: \SetArbUp{ $\langle code \rangle$ }.

- 87 \NewDocumentCommand{\al@arbup@dflt}{m}{\thinspace#1}%
- 88 \NewDocumentCommand{\al@arbup}{m}{\al@arbup@dflt{#1}}
- 89 \NewDocumentCommand{\arbup}{m}{\al@arbup{#1}}
- 90 \NewDocumentCommand{\ArbUpDflt}{}\let\al@arbup=\al@arbup@dflt}
- 91 \NewDocumentCommand{\NoArbUp}{}{\RenewDocumentCommand{\al@arbup}{m}{##1}}
- 92 \NewDocumentCommand{\SetArbUp}{m}{\RenewDocumentCommand{\al@arbup}{m}{#1}}

\uc Proper Arabic names or book titles should be passed to the \uc command so that they have their first letters uppercased. \uc is actually coded in Lua.

- 93 \NewDocumentCommand{\uc}{m}%
- 94 {\luadirect{tex.sprint(uc(\luastringN{#1}))}}

\Uc \uc can be used safely in all of the modes that are provided by arabluatex as any of the voc, fullvoc and novoc modes discard it on top of any other functions to be run. \Uc does the same as \uc except that it is never discarded. For that reason, \Uc should never be used outside the trans mode. arabluatex uses \Uc internally so as to prevent \uc from being discarded in case words that are to be transliterated are inserted into Arabic commands or environments where transliteration is not required. Therefore, it is not documented.

95 \let\Uc\uc

\prname \prname is to be used outside Arabic environments for proper names. It takes as argument one or more Arabic words, each of which will be rendered in upright roman style with its first letter uppercased.

\prname* Unlike \prname, \prname* does not take arabtex or buckwalter input as argument, but already Unicode converted names and renders them in upright roman style.

- 96 \NewDocumentCommand{\prname}{s m}{%
- 97 \bgroup\SetTranslitStyle{\relax}%
- 98 \IfBooleanTF{#1}{\txtrans{#2}}{\arb[trans]{\uc{#2}}}\egroup}

\txarb sets the direction to right-to-left and selects the Arabic font. It is used internally by several Lua functions, but available to the user should he wish to insert utf8 Arabic text in his document.

\txtrans is used internally by several Lua functions to insert transliterated Arabic text. Therefore, it is not documented.

\bayt Each verse consists of two hemistichs; therefore the \bayt command takes two arguments, the first receives the sadr and the second the aguz. That two subsequent hemistichs should be connected with one another is technically named $tadw\bar{\imath}r$. In some of these cases, the hemistichs may be connected by a prominent horizontal flexible stroke which is drawn by the \al@verse@stroke command.

\SetHemistichDelim

A hemistich delimiter also may be defined. By default, it is set to the 'star' character: *. The $\SetHemistichDelim{\langle delimiter \rangle}$ command can be used at any point of the document to change this default setting.

\indent \par

```
313 \NeedsTeXFormat{LaTeX2e}
314 \ProvidesPackage{arabluatex-patch}%
315 [2016/11/14 v1.0 patches for arabluatex]
```

I have put in a separate .sty file external lines of code that I had to patch for a good reason. I hate doing this, and hopefully, most of these lines will disappear as soon as they are not required anymore.

The following is taken from latex.ltx. I had to make this patch for I could not find a way to process the list environments in right-to-left mode. The LuaTEX primitives \bodydir and \pagedir will eventually allow us to get rid of this: 316 \def\list#1#2{%

```
