

The `luainputenc` package

Elie Roux

`elie.roux@telecom-bretagne.eu`

2009/11/20 v0.95

Abstract

Input encoding management for Lua_T_EX. For an introduction on this package (among others), please refer to `luatex-reference.pdf`.

1 Documentation

1.1 Introduction

One the the most interesting new features of Lua_T_EX is the fact that it is (like Omega/Aleph) not limited to 256 characters, and can now understand Unicode. The problem is that it does not read input the way older engines (like pdf_T_EX) do, and thus `inputenc` is totally broken with Lua_T_EX. This package aims at replacing `inputenc` for Lua_T_EX, by adapting the way Lua_T_EX handles input, and the way `inputenc` handles UTF-8. This package has two very distinct modes: 8-bit and UTF-8.

1.2 Overview of 8-bit mode

This package **does not** map 8-bit encodings to utf8. It allows LuaTeX to read 8-bit characters, by converting each byte into a unicode character with the same character number. The resulting unicode characters are not true UTF-8, they are what we will call “fake UTF-8”. For example the byte 225 will be converted into the unicode character with number 225 (two bytes long). It will be true UTF-8 only if the encoding is latin1.

Here is how it works: the 8-bit encodings are converted into fake UTF-8, so that the corresponding tokens are chars with the good numbers. Then (like `inputenc`) it reads the char numbers, and converts it into LICR (L^AT_EX Internal Character Representation), with the font encoding.

In LuaTeX version 0.43, a new callback called `process_output_buffer`, this callback allows to make LuaTeX write 8-bit instead of UTF-8, so the behaviour is the same as pdfTeX as this level. For versions prior to 0.43 though, we need to do more tricky things, described in the next paragraph. This machinery is disabled for LuaTeX version 0.43 and superior, so you can keep the default behaviour, which will be compatible with pdfTeX in most cases, but you can consider the machinery obsolete.

For these old versions, `luainputenc` only changes the input behaviour, it does not change the output behaviour (when files are written for example). The consequence is that files will still be written by LuaTeX in UTF-8 (fake UTF-8 in this case), even if the asked input encoding is a 8-bit encoding. In most cases it’s not a problem, as most files will be written in LICR, meaning ASCII, which is both 8-bit and UTF-8. The problem comes when characters with a number > 128 are written in a 8-bit encoding. This may happen if you use `\protect` in a section for example. In these cases, LuaTeX will write fake UTF-8, and try to read 8-bit encoding, so it will get confused.

The proposed solution is to unactivate the input conversion when we read certain files or extensions. This package should work with no change for most documents, but if you cook your own aux files with an unknown extension, you may have to force the package to read some files in UTF-8 instead of 8-bit. See comments in the `.sty` file to know the useful commands.

1.3 Overview of UTF-8 mode

The behaviour of `inputenc` in utf8 mode is to read the input byte by byte, and decide if the character we are in is 1, 2, 3 or 4 bytes long, and then read other bytes accordingly. This behaviour fails with LuaTeX because it reads input character by character (characters do not have a fixed number of bytes in unicode). The result is thus an error.

All characters recognized by TeX are active characters, that correspond to a LICR macro. Then `inputenc` reads the `*.dfu` files that contain the correspondance between these LICR macros and a character number in the fonts for different font encodings (T1, OT1, etc.).

1.3.1 legacy mode

`luainputenc` can get this behaviour (we will call it *legacy mode*, but another difference implied by the fact that LuaTeX can read more than 256 characters is that fonts can also have more than 256 characters. LuaTeX can thus read unicode fonts. If we want to use unicode fonts (OTF for example), we can’t use the *legacy mode* anymore, as it would mean that we would

have to rewrite a specially long `unicode.dfu` file, and it would be totally inefficient, as for instance `é` (unicode character number 233) would be mapped to `\'e`, and then mapped back to `\char 233`.

1.3.2 unicode font mode

To fix this, the most simple solution is to deactivate all activated characters, thus typing `é` will directly call `\char 233` in the unicode fonts, and produce a `é`. We will call this behaviour the *unicode font mode*. To enable this mode, you can use the option `unactivate` in `luainputenc`, and you must use the font encoding `EU2` provided by this package too. See section 2.5 for more details about `EU2`. To use this mode with `EU2`, you must be able to open OTF fonts. A simple way to do so is by using the package `luaotfload`.

1.3.3 mixed mode

But the *unicode font mode* has a strong limitation (that will certainly disappear with time): it cannot use non-unicode fonts. If you want to mix unicode fonts and old fonts, you'll have to use the *mixed mode*. In this mode you can type some parts of your document in *legacy mode* and some in *unicode font mode*. The reason why we chose not to integrate this choice in the *legacy mode* is that we wanted to have a mode that preserved most of the backward compatibility, to safely compile old documents; the *mixed mode* introduces new things that may break old documents. To get the *mixed mode*, you must pass the option `lutf8x` to `luainputenc`. This mode is the most experimental.

2 Files

This package contains a `.sty` file for both `LATEX` and Plain, a patch for `inputenc` to use `luainputenc` so that you can process old documents without changing anything, and the lua functions.

2.1 inputenc.sty patch

A good thing would be to patch `inputenc` to load `luainputenc` instead, so that you don't have to change your documents to load `luainputenc` especially. The `LATEX` team is extremely conservative and does not want this patch applied (maybe we will find a solution later). Here is a patch for `inputenc.sty`:

```

1
2   \ifnum\@tempcnta<'#2\relax
3     \advance\@tempcnta\@ne
4   \repeat}
5 +
6 +\begingroup\expandafter\expandafter\expandafter\endgroup
7 +\expandafter\ifx\csname XeTeXversion\endcsname\relax\else
8 + \RequirePackage{xetex-inputenc}
9 + \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{xetex-inputenc}}
10 + \ProcessOptions*

61 \DeclareOption{utf8x}{\PassOptionsToPackage{utf8}{inputenc}}
62 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{inputenc}}
63 \ProcessOptions*
64 \expandafter\endinput
65 \fi
66

```

Here we know we are called with LuaT_EX. We first require luatextra, then we load the lua file.

```

67
68 \RequirePackage{luatextra}
69
70 \luatexUseModule{luainputenc}
71

```

Here is some code from inputenc.

```

72
73 \def\DeclareInputMath#1{%
74   \@inpenc@test
75   \bgroup
76     \uccode'\~#1%
77     \uppercase{%
78       \egroup
79       \def~%
80     }%
81 }
82 \def\DeclareInputText#1#2{%
83   \def\reserved@a##1 ${}%
84   \def\reserved@b{#2}%
85   \ifcat_\expandafter\reserved@a\meaning\reserved@b$ $_%
86     \DeclareInputMath{#1}{#2}%
87   \else
88     \DeclareInputMath{#1}{\IeC{#2}}%
89   \fi
90 }
91 \def\IeC{%
92   \ifx\protect\@typeset@protect
93     \expandafter\@firstofone
94   \else
95     \noexpand\IeC
96   \fi
97 }

```

We changed a little the behaviour of this macro: we removed `\@inpenc@loop\^^?\^^ff`, because it made no sense in UTF-8 mode. We will call this line for 8-bit encodings.

Note that the code has been changed for `\endlinechar`, because in new versions (from v0.43) of LuaTeX the value cannot exceed 127. Thus, with the old version of `luainputenc`, when trying to add 10000, it fails silently, and when 10000 is subtracted, the new value is -1, resulting in no end of lines at all in the document.

```

98
99 \def\inputencoding#1{%

```

```

141 \repeat}
142

```

Here we declare our options. Note that we remap `utf8` to `lutf8`, because we use out `lutf8.def` instead of `inputenc`'s `utf8.def`.

```

143
144 \DeclareOption{utf8}{%
145   \inputencoding{lutf8}%
146 }
147
148 \DeclareOption{lutf8}{%
149   \inputencoding{lutf8}%
150 }
151
152 \DeclareOption{utf8x}{%
153   \inputencoding{lutf8}%
154 }
155
156 \DeclareOption{lutf8x}{%
157   \inputencoding{lutf8x}%
158 }
159

```

For the `unactivate` option, for *unicode font mode*, we just don't do anything.

```

160
161 \DeclareOption{unactivate}{%
162   \edef\inputencodingname{unactivate}%
163 }
164

```

All other options are 8-bit encodings, so we activate the translation into fake UTF-8, and we execute the loop we removes from `\inputencoding`.

```

165
166 \DeclareOption*{%
167   \lIE@activate %
168   \@inpenc@loop\^^?\^^ff%
169   \inputencoding{\CurrentOption}%
170 }
171

```

The rest of the file is only the machinery for LuaTeX versions without the callback `process_output_buffer`, so it will be deprecated after TeXLive 2009, you are not advised to use it.

```

172
173 \ifnum\luatexversion>42
174
175   \newcommand*\lIE@activate}[0]{%
176     \luadirect{luainputenc.register_callbacks()}%
177   }
178

```

```
179 \else
180
```

`\lIE@setstarted` and `\lIE@setstopped` are called when the fake UTF-8 translation must be activated or deactivated. You can call them several successive times. They are called very often, even if the package is not activated (for example if it's loaded with the `utf8` option), but they act only if the package is activated.

```
181
182 \newcommand*\lIE@setstarted[0]{%
183   \ifnum\lIE@activated=1 %
184     \luadirect{luainputenc.setstarted()}%
185   \fi %
186 }
187
188 \newcommand*\lIE@setstopped[0]{%
189   \ifnum\lIE@activated=1 %
190     \luadirect{luainputenc.setstopped()}%
191   \fi %
192 }
193
```

The following 5 macros are made to declare a file that will have to be read in fake UTF-8 and not in 8-bit. These files are the ones that will be generated by `TeX`. In **no way** this means you can include true UTF-8 files, it means that you can include files that have been written by `LuaTeX` with `luainputenc`, which means files in fake UTF-8. The macros are very simple, when you call them with a file name (the same as the one you will use with “input”), it will read it with or without the fake UTF-8 translation. This package includes a whole bunch of extensions that will be read in fake UTF-8, so the occasions to use these macros will be rare, but if you use them, please report it to the package maintainer.

`\lIE@SetUtfFile` If you call this macro with a file name, each time you will input this file, it will be read in fake UTF-8. You can call it with a file that you generate with `LuaTeX` and that you want to include.

```
194
195 \newcommand*\lIE@SetUtfFile[1]{%
196   \luadirect{luainputenc.set_unicode_file([[#1]])}%
197 }
198
```

`\lIE@SetNonUtfFile` Same as the previous macro, except that the file will be read as 8-bit. This macro is useful if there is an exception in an extension (see further comments).

```
199
200 \newcommand*\lIE@SetNonUtfFile[1]{%
201   \luadirect{luainputenc.set_non_unicode_file([[#1]])}%
202 }
203
```

`\lIE@UnsetFile` This macro gives a file the default behaviour of its extension.

```
204
```

```

205 \newcommand*\lIE@UnsetFile[1]{%
206   \luadirect{luainputenc.unset_file([[#1]])}%
207 }
208

```

\lIE@SetUtfExt You can tell luainputenc to treat all files with a particular extension in a certain way. The way the file extension is checked is to compare the four last characters of the filename. So if your extension has only three letters, you must include the preceding dot. This macro tells luainputenc to read all files from an extension in fake UTF-8.

```

209
210 \newcommand*\lIE@SetUtfExt[1]{%
211   \luadirect{luainputenc.set_unicode_extention([[#1]])}%
212 }
213

```

\lIE@SetUtfExt Same as before, but the files will be read in 8-bit.

```

214
215 \newcommand*\lIE@SetNonUtfExt[1]{
216   \luadirect{luainputenc.set_non_unicode_extention([[#1]])}
217 }
218

```

\lIE@InputUtfFile This macro inputs a file in fake UTF-8. It has the “feature” to unset the behaviour on the file you will call, so to be safe, you must call them with files for which the behaviour has not been set.

```

219
220
221 \newcommand*\lIE@InputUtfFile[1]{%
222   \lIE@SetUtfFile{#1}%
223   \input #1%
224   \lIE@UnsetFile{#1}%
225 }
226

```

\lIE@InputNonUtfFile Same as before, but to read a file as 8-bit.

```

227
228 \newcommand*\lIE@InputNonUtfFile[1]{%
229   \lIE@SetNonUtfFile{#1}%
230   \input #1%
231   \lIE@UnsetFile{#1}%
232 }
233

```

Two definitions to put the previous two macros in the user space.

```

234
235 \newcommand*\InputUtfFile[1]{%
236   \lIE@InputUtfFile{#1}%
237 }

```

```

238
239 \newcommand*\InputNonUtfFile[1]{%
240   \lIE@InputNonUtfFile{#1}%
241 }
242
243 \newcount\lIE@activated
244
245 \newcommand*\lIE@activate}[0]{%
246   \lIE@activated=1 %
247   \lIE@setstarted %
248 }
249
250 \newcommand*\lIE@FromInputenc}[1]{%
251   \ifnum\lIE@activated=0 %
252     \lIE@activate %
253   \fi%
254 }
255
256 \fi
257
258 \ProcessOptions*
259

```

2.3 lutf8.def

```

260 %% This file was adapted from utf8.def, which copyright is:

```

This file is mostly the code from `lutf.def`, but it adds mechanisms to pass from *legacy mode* to *unicode font mode*. The trick is to put in a lua table all characters that are activated by the *legacy mode*, and to unactivate them when we switch to *unicode font mode*. This is made (almost) entirely in lua. The difficult part is the changes in `\DeclareFontEncoding`.

```

2.5 eu2enc.def

This file is extremely short. It just declares the encoding, with the default font. The default font here is lmr, which means that L^AT_EX will read eu2lmr.fd. The problem is that all unicode fonts are OTF fonts, so eu2lmr.fd will call OTF fonts. Thus, to use EU2, you need to be able to read OTF fonts. The package luaotfload is a good choice to be able to do so.

```

469
470 \ProvidesFile{eu2enc.def}[2009/11/20 v0.1 a unicode font encoding for LuaTeX.]
471 \DeclareFontEncoding{EU2}{-}{-}
472 \DeclareErrorFont{EU2}{lmr}{m}{n}{10}
473 \DeclareFontSubstitution{EU2}{lmr}{m}{n}
474

```

2.6 eu2lmr.fd

This file simply describes the default (lmr) font of the EU2 encoding. It loads the otf fonts with some default features enabled. This file may change, don't rely on it too much.

```

2.7 luainputenc.lua

First the `inputenc` module is registered as a `LuaTeX` module, with some informations.

```

529
530 luainputenc = { }
531
532 luainputenc.module = {
533     name      = "luainputenc",
534     version   = 0.95,
535     date      = "2009/11/20",
536     description = "Lua simple inputenc package.",
537     author    = "Elie Roux",
538     copyright  = "Elie Roux",
539     license    = "CC0",
540 }
541
542 luatextra.provides_module(luainputenc.module)
543
544 local format = string.format
545
546 luainputenc.log = luainputenc.log or function(...)
547     luatextra.module_log('luainputenc', format(...))
548 end

```

```

549
550 local char, utfchar, byte, format, gsub, utfbyte, utfgsub =
551 string.char, unicode.utf8.char, string.byte, string.format, string.gsub, unicode.utf8.byte, unicon
552

```

The function to transform a 8-bit character in the corresponding fake UTF-8 character.

```

553
554 function luainputenc.byte_to_utf(ch)
555     return utfchar(byte(ch))
556 end
557

```

The function that will be registered in the `process_input_buffer` callback when needed.

```

558
559 function luainputenc.fake_utf_read(buf)
560     return gsub(buf,"(.)", luainputenc.byte_to_utf)
561 end
562

```

The function to transform a fake utf8 character in the corresponding 8-bit character.

```

563
564 function luainputenc.utf_to_byte(ch)
565     return char(utfbyte(ch))
566 end
567

```

The function that will be registered in the `process_output_buffer` callback if it exists.

```

568
569 function luainputenc.fake_utf_write(buf)
570     return utfgsub(buf,"(.)", luainputenc.utf_to_byte)
571 end
572

```

Here we register the two callbacks, and the behaviour is the same as in pdfTeX. The next part of the file is only the machinery for LuaTeX versions without the callback `process_output_buffer`, so it will be deprecated after TeXLive 2009, you are not advised to use it.

```

573
574 if tex.luaTeXversion > 42 then
575
576     function luainputenc.register_callbacks()
577         callback.add('process_output_buffer', luainputenc.fake_utf_write, 'luainputenc.fake_utf_wr
578         callback.add('process_input_buffer', luainputenc.fake_utf_read, 'luainputenc.fake_utf_read
579     end
580
581 else
582

```

`start()` and `stop()` are the functions that register or unregister the function in the callback. When the function is registered, LuaTeX reads the input in fake UTF-8.

```

583
584     local started, stopped = 1, 0
585
586     luainputenc.state = stopped
587
588     function luainputenc.setstate(state)
589         if state == luainputenc.state then
590             return
591         elseif state == started then
592             luainputenc.start()
593         else
594             luainputenc.stop()
595         end

749         end
750     end
751
752 end
753

```

Finally we provide some functions to activate or deactivate the catcodes of the non-ASCII characters.

```

754
755
756 luainputenc.activated_characters = {}
757 luainputenc.characters_are_activated = false
758
759 function luainputenc.declare_character(c)
760     luainputenc.activated_characters[tounumber(c)] = true
761 end
762
763 function luainputenc.force_characters_activated ()
764     luainputenc.characters_are_activated = true
765 end
766
767 function luainputenc.activate_characters()
768     if not luainputenc.characters_are_activated then
769         for n, _ in pairs(luainputenc.activated_characters) do
770             tex.sprint(string.format('\catcode %d\\active',n))
771         end

```

```

772         luainputenc.characters_are_activated = true
773     end
774 end
775
776 function luainputenc.desactivate_characters()
777     if luainputenc.characters_are_activated then
778         for n, _ in pairs(luainputenc.activated_characters) do
779             tex.sprint(string.format('\catcode %d=11',n))
780         end
781         luainputenc.characters_are_activated = false
782     end
783 end
784

```
