

# The *selnolig* package: Selective suppression of typographic ligatures<sup>\*</sup>

Mico Loretan<sup>†</sup>

2013/08/08

## Abstract

The *selnolig* package suppresses typographic ligatures selectively, i.e., based on predefined search patterns. The search patterns focus on ligatures deemed inappropriate because they span morpheme boundaries. For example, the word *sheffu1*, which is mentioned in the T<sub>E</sub>Xbook as a word for which the ff ligature might be inappropriate, is automatically typeset as *shelfful* rather than as *shelffful*.

For English and German language documents, the *selnolig* package provides extensive rules for the selective suppression of so-called “common” ligatures. These comprise the ff, fi, fl, ffi, and ffl ligatures as well as the ft and fft ligatures. Other f-ligatures, such as fb, fh, fj and fk, are suppressed globally, while making exceptions for names and words of non-English/German origin, such as *Kafka* and *fjord*.

For English language documents, the package further provides ligature suppression rules for a number of so-called “discretionary” or “rare” ligatures, such as ct, st, and ss.

The *selnolig* package requires use of the Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub> format provided by a recent T<sub>E</sub>X distribution, e.g., T<sub>E</sub>XLive 2013 and MiK<sub>T</sub>E<sub>X</sub> 2.9.

<sup>\*</sup>Current version: 0.254. Features of the *selnolig* package are subject to change without prior notice.

The main text font used in this document is Garamond Premier Pro. EB Garamond is used for words that use the fb, fh, fj, fk, ffb, ffh, ffj, ffk, and ss ligatures. “Common”, “discretionary”, and “historic” typographic ligatures are enabled for these fonts—and are suppressed selectively using the rules of the *selnolig* package.

## I Introduction

The ability of TEX and Friends to use typographic ligatures has long been cherished by its users. Indeed, the automated and transparent use of typographic ligatures by TEX and Friends is often offered up as one of the reasons for using these programs to obtain high-quality typeset output.

However, even though the automatic use of typographic ligatures is highly desirable in general, there are words for which the use of certain typographic ligatures may not be appropriate. The TEXbook observes, on page 19, that the word `shelfful` may look better if it is typeset as “shelfful”, i.e., *without* the ff-ligature, rather than as “shelfful”. Some other English-language words that would generally be considered to be good candidates for non-use of ligatures are `cufflink` and `offload`; compare their appearance with that of `cufflink` and `offload`. Observe that all three of these words are composed of two *morphemes*: the first morpheme ends in an “f” or “ff” while the second morpheme starts with either an “f” (in the case of `shelfful`) or an “l” (in the cases of `cufflink` and `offload`). A *morpheme*, briefly stated, is the smallest linguistic unit within a word that bears distinct meaning; all words—other than nonsense words, I suppose—contain at least one morpheme. The words `apple` and `orange` contain one morpheme each, and the words `apples`, `oranges`, `shelfful`, `cufflink`, and `offload` each contain *two* morphemes. Stated formally, the main purpose of the `selnolig` package is to provide methods and rules for an automated yet selective (rather than global) suppression of typographic ligatures that span certain morpheme boundaries.

For English language documents, the need to suppress typographic ligatures that span morpheme boundaries does not appear to be a hugely pressing typographic concern, possibly because English doesn’t feature composite words that frequently. However, in other languages, such as German, composite words are much more common. In these languages, there is naturally a much greater potential for composite words to feature instances of `ff`, `fi`, `f1` etc. character pairs spanning morpheme boundaries. In German typography, a ligature that spans a morpheme boundary appears to be something that should be avoided at (nearly) all cost, presumably because the presence of the ligatures has the potential to impair seriously the intelligibility of the composite words.<sup>1</sup>

TEX and Friends offer several methods for suppressing ligatures on a case-by-case basis.<sup>2</sup> However, these methods must be applied separately to each and every occurrence of all words that contain unwanted ligatures. As such, these case-by-case methods are both time-intensive and tedious. Moreover, there’s always a residual risk that some words for which certain ligatures should be suppressed will be overlooked in the editing process.

What has *not* been available so far is a LATEX package that (a) provides a list of word patterns and entire words for which ligatures should be suppressed and (b) systematically discovers all instances of these patterns in a document and applies the non-ligation rules automatically to all words for which one or more pattern matches obtain. The `selnolig` package is meant to address this need. The package is currently set up to handle

---

<sup>1</sup>For German texts, I believe that the *Duden* provides authoritative backing for questions related to selective ligature suppression. For English texts, I’m not aware of the existence of a document, issued by an official or quasi-official body, that prescribes whether ligatures that span morpheme boundaries should be suppressed. If anybody can provide such a reference, I would be happy to list it.

<sup>2</sup>In LATEX, there are three basic methods for suppressing ligature within a character pair: (i) insertion of an “empty atom”, `{}` between the characters, (ii) insertion of an explicit italic correction, `\!/`, and (iii) insertion of an explicit “kern”, e.g., `\kern0pt` or `\hspace{0pt}`. The `babel` package, when used with the `ngerman` option, offers the “shortcut” macro `\|` for this purpose. Note, though, that the first ligature suppression method, `{}`, does *not* work if the document is compiled with LuaLATEX.

non-ligation issues for English and German language documents by providing extensive lists of ligature suppression rules tailored to the respective languages. Of course, I make no claim as to the completeness of either list. The package therefore makes it straightforward for users to provide their own supplemental ligature suppression rules to treat words not already covered by the package.<sup>3</sup>

For both English and German language documents, the `selnolig` package provides rules to suppress *selectively* the following f-ligatures: `ff`, `fi`, `fl`, `ffi`, and `ffl`—the “standard” f-ligatures that should be familiar to most users of Computer Modern fonts—as well as the `ft` and `fft` ligatures. The latter two ligatures, while not provided by the Computer Modern and Latin Modern font families, are frequently available in `oldstyle` (also known as “Garamond”) font families.<sup>4</sup> Oldstyle-type font families generally feature a great variety of typographic ligatures. Given the popularity of these font families for typesetting, the `selnolig` package provides ligature suppression rules for many of the ligatures provided by these font families.

For both English and German language documents, the `fb`, `fh`, `fj`, and `fk` ligatures are suppressed *globally*; see also [Section 5.6](#). However, exceptions are provided in order not to suppress these ligatures for selected words of *non-English/German* origin, such as *fjord*, *fjell*, *Prokofjew*, and *Kafka*.

For English language documents, the `selnolig` package recognizes an option called `broadf`; if it is set, additional f-ligatures will be suppressed selectively. The package also features an option called `hd1ig` to provide selective ligature suppression for discretionary (aka rare) ligatures, such as `ct`, `st`, `sp`, `sk`, `th`, `at`, `et`, `ll`, `as`, `is`, and `us`. No rules are provided to suppress historic/rare ligatures for German documents.<sup>5</sup>

The `selnolig` package also provides supplemental hyphenation exception lists for both English and German language words. The words in these lists are generally composite and contain one or more typographic ligatures that should be suppressed.

The remainder of this document is organized as follows. [Section 2](#) provides brief instructions for loading the `selnolig` package and making one’s document(s) suitable for compilation under Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub> (if you haven’t already done so). The package’s overall approach to selective ligature suppression, which is based on morphemes (the components of a word that convey meaning), is explained in [Section 3](#), the user macros are presented in [Section 4](#), and options that affect the package’s workings are explained in [Section 5](#). [Section 6](#) discusses further issues that may arise when looking to break up typographic ligatures. The package’s ligature suppression rules for English and German documents are listed in [Appendices A](#) and [B](#). The code of the package’s main “style” file, `selnolig.sty`, and Lua code, in `selnolig.lua`, are shown in [Appendices C](#) and [D](#). In [Appendix E](#), the results of a simple, and by no means statistically representative, case study into the actual counts of ligature suppressions in two English novels (*Call Of The Wild* and *The Sea Wolf*) and one German novel (*Die Buddenbrooks*) are reported. Unsurprisingly, morpheme-crossing ligatures occur far more frequently in the German novel—by a factor of more than 100! [Appendix F](#) provides a suggested template for reporting bugs and other issues with the package.

---

<sup>3</sup>If you come up with such words, please email them to me so that I can augment and update the package’s ligature suppression rules. A suggested template for reporting such cases is provided in [Appendix F](#).

<sup>4</sup>In some oldstyle font families, the “`ft`” and “`fft`” ligatures are rendered as “`ft`” and “`fft`”, respectively.

<sup>5</sup>A remark on the classification of various forms of typographic ligatures in OpenType fonts: There appears to little terminological standardization as to which typographic ligatures are labelled “historic” and which ones are labelled “discretionary”/“rare”. To wit, the fonts Latin Modern Roman, Garamond Premier Pro, and Hoefer Text report having “only” discretionary ligatures, whereas Junicode, Cardo, EB Garamond, and Palatino Linotype report having both historic and discretionary ligatures. Interestingly, none of these fonts report having ligatures classified as either “contextual” or “required”.

## 2 I'm in a hurry! How do I start using this package?

### 2.1 How do I load the `selnolig` package?

- If your document is in English and you want to enable a “basic” set of rules to suppress f-ligatures selectively, load the package by issuing the following instruction in the preamble of your document:

```
\usepackage[english]{selnolig}
```

Synonymous options are `UKenglish`, `british`, `USenglish`, `american`, `canadian`, `australian`, and `newzealand`.

If you want to load a set of f-ligature suppression rules that's broader than the set that's enabled by default, be sure to also specify the option `broadf`; see [Section 5.3](#). If “historic” and/or “discretionary” ligatures (e.g., `ct`, `st`, `ſp`, `th`, `as`, `is`, and `us`) are enabled, be sure to specify the option `hdlig`. The options `broadf` and `hdlig` may be specified independently.

- If your document is written in German, load the package as follows:

```
\usepackage[ngerman]{selnolig}
```

Synonymous language options are `german`, `austrian`, `naustrian`, `swissgerman`, and `swiss`.

- If you load the package *without* an explicit language option, i.e., as

```
\usepackage{selnolig}
```

but if one or more of the language options noted above are specified as options in the `\documentclass` instruction, L<sup>A</sup>T<sub>E</sub>X will pass these options on to the `selnolig` package.

- If no language options are set either when the package is loaded or as options in the `\documentclass` instruction, you will need to provide your own ligature suppression rules. This approach is called for if you write in a language other than German or English—the only two languages currently supported by the `selnolig` package—and are able to devise your own ligature suppression rules using `selnolig`'s `\nolig` and `\keeplig` macros.

### 2.2 Any hints on how to get started with LuaL<sup>A</sup>T<sub>E</sub>X?

The ligature suppression macros of the `selnolig` package *require* the use of LuaL<sup>A</sup>T<sub>E</sub>X; they will not work under either pdfL<sup>A</sup>T<sub>E</sub>X or X<sub>PL</sub>L<sup>A</sup>T<sub>E</sub>X.<sup>6</sup> If you've been using pdfL<sup>A</sup>T<sub>E</sub>X until now, the requirement to use LuaL<sup>A</sup>T<sub>E</sub>X will likely force you to make some changes to your existing documents. Fortunately, these changes should be minor and straightforward to implement, because LuaL<sup>A</sup>T<sub>E</sub>X is (for the most part) a strict superset of pdfL<sup>A</sup>T<sub>E</sub>X. Almost all documents that compile correctly under pdfL<sup>A</sup>T<sub>E</sub>X should also compile correctly under LuaL<sup>A</sup>T<sub>E</sub>X. The most important changes you'll need to make are:

---

<sup>6</sup>If the `selnolig` package is not run under LuaL<sup>A</sup>T<sub>E</sub>X, a warning message will be issued and only the package's supplemental hyphenation rules will be available to the user.

- (i) Do not load either the `inputenc` or the `fontenc` package.
- (ii) Be sure to load the `fontspec` package,<sup>7</sup> and use `\setmainfont`, `\setsansfont`, and related commands to load the fonts you wish to use.

Depending on your  $\text{\TeX}$  distribution, the default font family used by Lua $\text{\TeX}$  will be either Computer Modern or Latin Modern. If you wish to use a different font family, further font-related instructions will be required. *How to specify fonts and font families and set up various font-related options in Lua $\text{\TeX}$*  are topics that go far beyond the scope of this user guide. I urge you to become familiar with the very well-written [user guide](#) of the `fontspec` package.

You will also need to use a  $\text{\TeX}$  distribution that features a fairly recent version of Lua $\text{\TeX}$ .  $\text{\TeX}Live$  - 2013,  $\text{\TeX}Live$  2012, and MiK $\text{\TeX}$  2.9 satisfy this requirement; versions of  $\text{\TeX}Live$  before 2011 probably do not. If you use a command-line interface to compile a document named, say, `myfile.tex`, type

```
lualatex myfile
```

rather than either `latex myfile` or `pdflatex myfile` to initiate compilation. If you use a text editing program with pull-down menus or buttons to invoke a suitable compiler, be sure to select **Lua $\text{\TeX}$** .

The very first time one runs Lua $\text{\TeX}$  on a document with a new set of fonts, the compilation speed will likely be quite slow, because Lua $\text{\TeX}$  (actually, a package loaded by Lua $\text{\TeX}$ ) has to create various cache files to store font-related information. Subsequent compilation runs should be much faster.

The answers to the questions [Frequently loaded packages: Differences between pdf \$\text{\TeX}\$  and Lua \$\text{\TeX}\$ ?](#) and [Using Lua \$\text{\TeX}\$  as a replacement for pdf \$\text{\TeX}\$](#) , both posted to [tex.stackexchange.com](#), provide very useful information for people who are new to Lua $\text{\TeX}$  and are at least somewhat familiar with pdf $\text{\TeX}$ 's ways of getting things done. Another great resource for people who wish to become more familiar with Lua $\text{\TeX}$  is [A Guide to Lua \$\text{\TeX}\$](#)  by Manuel Pégourié-Gonnard.

### 2.3 Anything else I need to do or know?

For multilingual support, Lua $\text{\TeX}$  and the `selnolig` package work well with the `babel` package. If your document loads the `babel` package, be sure to load the `selnolig` package *after* the `babel` package, so that the supplemental hyphenation patterns provided by the `selnolig` package won't get clobbered by `babel`'s hyphenation settings.<sup>8</sup>

Lua $\text{\TeX}$  natively supports the so-called UTF-8 input encoding scheme; in fact, it is also the *only* input encoding scheme that Lua $\text{\TeX}$  knows about. The `selnolig` package assumes that the  $\text{\TeX}$  files it operates on conform to this input encoding method. Nowadays, many modern  $\text{\TeX}$ -aware editors support UTF-8 directly; `selnolig` should have no problems with  $\text{\TeX}$  files produced by these editors. Older files, however, may use other input encoding systems. If your input files currently use a different input encoding scheme,

---

<sup>7</sup>If the `selnolig` package is run under Lua $\text{\TeX}$  but the `fontspec` package isn't loaded by the time the `\begin{document}` statement is encountered, `selnolig` will terminate with an error message.

<sup>8</sup>The `selnolig` package is also compatible with the `hyphsubst` package (which, if used, should be loaded with a `\RequirePackage` statement *before* the `\documentclass` instruction). With  $\text{\TeX}Live$  2013, it may also be possible to use the `polyglossia` package with Lua $\text{\TeX}$  and hence with `selnolig`, but I haven't verified that this is the case.

e.g., `LATIN1`, you must convert them to `UTF-8`. Several methods exist for changing a file's input encoding scheme. Please see the question [How to change a `.tex` file's input encoding system \(preferably to `UTF-8`\)?](#) and the associated answers on [tex.stackexchange.com](#) for some possible methods.

If your document is written in German, it is assumed that all vowels with dieresis (Umlaute) are entered as ä, ö, ü, etc. rather than, say, as `\{a}`, `\{o}`, and `\{u}` or (if you tend to use the babel "shortcuts") as "a, "o, and "u. Likewise, it's assumed that you enter the "eszett" ("scharfes s") character as ß rather than as `\ss`.<sup>9</sup> It is also assumed that you use the triple-f (modern) spelling of words such as `Schiffahrt`, `Stofffarbe`, and `grifffest` and the double-t (modern) spelling of words such as `Mannschafttest`.

Finally, all babel-style "`|`" ligature-suppressing shortcuts should either be removed entirely or be replaced with `\breaklig` instructions; the `selnolig` package's `\breaklig` macro is explained in [Section 4.1.4](#).<sup>10</sup>

### 3 The `selnolig` package's approach to breaking up ligatures

#### 3.1 Free, derivational, and inflectional morphemes, and their relationship to ligature suppression

Good typography supports and enhances the readability of the typeset text. There are obviously a great many facets to how typography may contribute to good readability. One aspect is the ease with which readers can discern the *meaning* of the typeset text and its constituent parts—words. Because a typographic ligature groups two or more characters into a composite glyph, it is natural for the reader to "read" a ligature as forming a single unit and, moreover, to associate the ligature with some part of the word's meaning. Whereas this mental association of visual unity and meaning can be helpful when it comes to discerning the meaning of single-morpheme words,<sup>11</sup> it *may* detract from the word's readability if the word is composite and the ligature happens to span a morpheme boundary. Ligatures that span a morpheme boundaries *may* impair the word's readability if readers experience the need to do a "double take" to separate out the morphemes used in the composite word.

What exactly are morphemes? Briefly put, morphemes are the smallest linguistic units within a word that carry *meaning*. Because words are, by definition, standalone units of text, each word contains at least one morpheme.<sup>12</sup> Morphemes are classified as *free* if they can stand alone as words (e.g., `cat`, `dog`, `sea`, `see`), and as *bound* if they can not. E.g., the letter `s` in the words `cats`, `dogs`, and `rivers` indicates the plural forms of the associated nouns; because the `s` particle cannot stand alone as a (meaningful) word, it is a bound morpheme.

Bound morphemes can be divided further into derivational and inflectional morphemes. A *derivational* morpheme changes the meaning of the associated free morpheme in a fundamental way. E.g., the "un" in "untrue" reverses the meaning of the associated free morpheme "true", and the "ful" in "shelfful" changes the word's meaning from a noun to a quantity measure ("two shelffuls of books on typography"). An *inflectional* morpheme signifies a less fundamental change in meaning. In nouns (and, depending on the language,

---

<sup>9</sup>TeXnically speaking, `selnolig` only requires the use of ä, ö, ü, etc. in the search strings of the ligature suppression rules.

<sup>10</sup>On my L<sup>a</sup>T<sub>E</sub>X system, whenever a "`|`" command is encountered, I either get a bad crash that requires a reboot of the computer (under MacT<sub>E</sub>X 2012) or I get a stern error message about "Forbidden control sequence found while scanning use of `\FancyVerbGetVerb`" (under MacT<sub>E</sub>X 2013).

<sup>11</sup>Examples of single-morpheme words containing a ligature are `off`, `fit`, `flat`, `office`, `baffle`, `left`, `aft`, `cost`, and `spin`.

<sup>12</sup>Please don't try to get me involved in a discussion of what it may mean to have words without meaning...

adjectives as well), inflectional morphemes indicate plural forms (child vs. children, cat vs. cats) and other forms of declination.<sup>13</sup> In verbs, inflectional morphemes indicate conjugation, such as a change in tense or of the subject performing the action implied by the verb. E.g., call vs. called, walk vs. walked, and also “swim” vs. “swims”, etc.

Words containing more than one morpheme can contain either “just” free morphemes—rooftop, newspaper, etc.—or free and bound morphemes joined together—untrue, shelfful, childish, etc. Bound morphemes in a word generally occur as prefixes or suffixes to the word’s “main part” or “stem” (the free morpheme). Prefixes almost invariably represent derivational morphemes (e.g., untrue, review, perform). Suffixes, in contrast, can represent either derivational *or* inflectional morphemes. For instance, the suffixes *like* and *less* in dwarflike and leafless are derivational morphemes, whereas the suffix *ed* in hounded and laughed is an inflectional morpheme.

It is important to realize that not all ligatures that span morpheme boundaries are equally inimical to good readability. Consider, say, the word *umbrellas*, which contains the ligature *as*. Note that this ligature crosses the morpheme boundary between the free morpheme *umbrella* and the suffix *s*. Nevertheless, I’m quite confident that few will claim that the presence of the *as* ligature detracts from the readability of the word *umbrellas*. I believe there are two reasons why this particular word’s readability is not impaired by the presence of a ligature that spans a morpheme boundary. First, the suffix *s* is an inflectional morpheme: it “merely” serves to change the noun’s state from singular to plural; clearly, most of the composite word’s meaning is conveyed by the free morpheme *umbrella*. Second, the ligature occurs at the very *end* of the word rather than, say, closer to the beginning or middle of the word.

The *selnlig* package adopts the following broad principles: First, ligatures that cross the boundaries of two free morphemes are always suppressed. Second, ligatures that cross the boundary between a free morpheme and a derivational morpheme are also suppressed—with certain exceptions that are explained below. Third, ligatures that span the boundary between a free morpheme and an inflectional morpheme are not suppressed. In Section 3.3 below, the third principle is shown to be particularly relevant for decisions related to the (non)suppression of certain ff and fft ligatures in German texts.

Observe that morphemes (which convey meaning) need not coincide with *syllables* (which convey pronunciation and sound). Indeed, a word can contain several syllables but consist of only one morpheme (e.g., apple, orange, banana), or it can consist of only one syllable but contain more than one morpheme (e.g., cats, dogs, reads, reeds, seas, and sees). The fact that a ligature may span a syllable boundary within a word does not, by itself, imply that this ligature should be suppressed.

To wit, consider the German adjective “straff” and its associated forms straffe, straffer, straffen, etc.: the free morpheme in all of these words is *straff*, while the suffixes *e*, *er*, and *en* represent inflectional morphemes. Even though there’s a syllable boundary between the two *ff*s for all modified forms of the adjective *straff*, the *ff*-ligature is used for all forms because it doesn’t span a *morpheme* boundary. If TeX’s hyphenation algorithm decides it needs to hyphenate the word *straffen* as *straf-fen* in some paragraph to generate a well-typeset paragraph, it can of course do so—and break up the ligature in the process. There’s no need, though, to break up a ligature pre-emptively just because the word *might* get hyphenated.

---

<sup>13</sup>In modern English, the virtually sole type of declination is to indicate plural status. In other languages, declination can also occur to indicate genitive, dative, accusative, etc. forms of nouns *and* adjectives. E.g., in German one says *das schöne Kind*, *des schönen Kindes*, *dem schönen Kinde*, etc. The particles *en/es* and *en/e* represent inflectional morphemes associated with the genitive and dative forms of the nouns and adjectives.

### 3.2 Ligature suppression rules: English language case

Unless the `broadf` option is set (see below), typographic ligatures are suppressed as follows:

- if two free morphemes are joined: halfline → halfline, shelflife → shelflife, rooftop → rooftop, halftone → halftone, wolftrap → wolftrap, houndstooth → houndstooth, arctangent → arctangent, newspaper → newspaper, clothespin → clothespin, *seastrand* → *seastrand*, etc.
- if a prefix (usually either a free or a derivational morpheme) and main word are joined: offload → offload, mistrust → mistrust, display → display, suspend → suspend, etc.
- if a main word and a suffix are joined, *if* the suffix is a derivational morpheme that begins with either an f or an l other than “ly”: shelfful → shelfful, leafless → leafless, dwarflike → dwarflike, leaflet → leaflet, etc.
- The ft ligature is also suppressed in words that end in `fth`: fifth → fifth, twelfth → twelfth. Note that the particle `th` contained in these words is a derivational morpheme. Moreover, a font may provide a ligature for the `th` character pair, in which case one should definitely use it for these words, i.e., typeset them as *fifth* and *twelfth* rather than as *fifth* and *twelfth*. Note that use of the trailing `th` ligature necessitates the suppression of the leading `ft` ligature.

If the `broadf` package option is set, the `selnolig` package will also suppress

- fi and ffi ligatures if the main word ends in f or ff and the suffix starts with an i, regardless of whether the suffix is a derivational or an inflectional morpheme: elfin, selfish, golfing, surfing, beefier, fluffily, fluffiness, goofiness, standoffish, jiffies, buffiest, etc.;
- fl and ffl ligatures in adverbs ending in `f1y` and `ff1y`, such as chiefly, briefly, and gruffly; and
- ft ligatures in words such as fifty and fiftieth.<sup>14</sup>

Note that the option `broadf` is *not* enabled by default. This is because I believe that any gain in readability that might result from breaking up the f-ligatures caught by the rules enabled by the `broadf` option would be minor and more than offset by the visual clashes created by unligated fi, ffi, fl, and ffl glyphs.

If the `hd1ig` package option is set, two additional ligature-suppressing principles are activated:

- The st and št ligatures are broken up for certain place names that end in stown, ston (but not “Houston”), and sport. Examples: Charleston and Hyannisport (not Hyannisport!). Likewise, the šk ligature is broken up for place names such as *Catskills* and *Peekskill*.
- The st and št ligatures are also suppressed for words with Greek roots that contain the sth and sph character triples, such as isthmus and atmosphere. Typesetting these words as isthmus and atmosphere, i.e., with the very distinctive looking st and št ligatures, risks reducing their readability, because doing so would obscure the presence of the th and ph character pairs which derive from single Greek letters θ/ϑ and φ/ϙ, respectively. For these words, then, it seems advisable to suppress the st and št ligatures even though, strictly speaking, no morpheme-crossing issues are involved.

---

<sup>14</sup>If the `broadf` option were *not* set, these words would be typeset as chiefly, briefly, gruffly, fifty, and fiftieth, respectively.

### 3.3 Ligature suppression rules: German language case

For German words, the following principles apply when it comes to deciding which ligatures to break up and which ones to permit. These rules are built mainly from statements found in the *Duden* and various websites that have taken an interest in this subject, with adaptations for the ft and fft ligatures.

- Case 1: Joining of two free morphemes: Ligatures are suppressed. Examples: Schilfinsel → Schilfinsel, Baustoffingenieur → Baustoffingenieur, Wasserstoffionen → Wasserstoffionen; Impffurcht → Impffurcht, Senffabrik → Senffabrik, Ablauflogik → Ablauflogik, Schorflecken → Schorflecken; fünffingrig → fünffingrig; Brieftaube → Brieftaube, elfteilig → elfteilig, Stofftasche → Stofftasche, etc.
- Case 2: Joining of a prefix (whether a free or a derivational morpheme) ending in f and a main word (free morpheme) starting with b, f, h, i, j, k, l, or t: Ligatures are suppressed. In German, by far the most common prefix that gives rise to the need to suppress various f-ligatures is the word “auf”, as in aufbrechen, auffassen, Aufführung, auffliegen, auffischen, aufhören, aufsisst, aufjaulen, aufklingen, Auflage, Auftrag, auftreten, etc.
- Case 3: Joining of a main word (free morpheme) ending in “f” or “ff” and a suffix (either a derivational or an inflectional morpheme) starting with “f”, “i”, “l”, or “t”.
  - Case 3a: Suffixes that start with an “f”, e.g., -fach and -faltig: The ff-ligature is suppressed. Examples: fünffach and zwölfaltig.
  - Case 3b: Suffixes (bound morphemes) that start with an “i”, such as -ig, -in, and -isch: The fi and ffi ligatures are *not* suppressed. Examples: streifig, äffisch, Chefin, Chefinnen.  
I haven't found a clear justification for this rule so far. I assume the rule is there because unligated fi and ffi character pairs are potentially sufficiently unsightly to make them stand out as an infraction against good typography that's even more grievous than having fi and ffi ligatures that span the boundary between a main word and a suffix.
  - Case 3c: Suffixes (free or bound morphemes) that start with an “l”, e.g., -lich, -ling, -lein and -los: The fl-ligature is suppressed. Example words: trefflich, höflich, Prüfling, Köpfelein, and straflos.
  - Interlude I: In ambiguous cases that could give rise to fl-ligatures that involve certain suffixes, according to *Duden* preference should be given to “how the syllables are pronounced and how a word would be hyphenated”, leading to a suppression of the fl-ligature. For instance, the fl-ligature is suppressed in Verzweiflung, Bezwifler, schweflig, and würflig. Note that the real suffixes in these words are ung, er, and ig, respectively, rather than lung, ler, and lig.<sup>15</sup>

---

<sup>15</sup>In my opinion, the rationale generally given for suppressing the fl-ligature in these cases—reliance on how the syllables are divided and how the composite words are hyphenated—is not entirely satisfactory. Morphologically speaking, the words Schwefel, Würfel, Zweifel, etc. contain two morphemes: a stem and the *derivational* morpheme el: Schwef|el, Würf|el, and Zweif|el, etc. It is therefore not necessary, in my opinion, to create a separate rule to justify the (non-)use of the fl-ligature in these cases. One

This convention may also be applied to justify the non-use of the fl-ligature in words such as knifflig and mufflig as well as in the present-tense/first-person-singular forms of the verbs büffeln, löffeln, schaufeln, stiefern, verteufeln, and zweifeln: these form are typeset *without* the fl/ffl-ligature, i.e., as büffle, löffle, schaufle, stieffe, verteufle, and zweifle, respectively.

- Interlude II: If a word *ends* with an f1 character pair because an abbreviation is in effect, *Duden* says it's OK to use the fl-ligature even if the f and l characters belong to different morphemes. E.g., in the abbreviation "Aufl.", the fl-ligature *is* employed even though the ligature should not be used for the full, unabbreviated form of the word (*viz.*, Auflage).

Although not mentioned explicitly by *Duden*, I believe this convention may be extended to justify the use of the ff-ligature in the abbreviated word "Auff." (full form: Aufführung—no ff ligature) and of the ft-ligature in "Auft." (full form: Auftrag—no ft ligature either).

This convention further suggests (implies?) that it's permissible (a) to use the ff ligature in surnames that end in ff, such as Orff and Hausdorff, and (b) to use the ffi- and ffl-ligatures in abbreviated names, such as Steffi and Steffl.

- Case 3d: Word stem (free morpheme) ending in f and derivational or inflectional morphemes starting with t. Unfortunately, not much official wisdom seems to exist to guide this case, possibly because the ft and fft ligatures are not (yet?) used as widely as are the other f-ligatures. The following rules should thus be understood to be somewhat provisional.

\* The convention mentioned in "Interlude II" above, about not breaking up an fl-ligature if it occurs at the very end of a word, applies to the case of ft and fft ligatures as well, i.e., they are not suppressed *if* they occur at the very ends of words (or at the ends syllables), as in verschärft, gestreift, gerafft, Dahingerafftsein, unbedarf, and Unbedarftheit.

Note that in these cases the ft and fft ligatures *do* span a morpheme boundary: the letter t is an *inflectional* morpheme that indicates a form of conjugation of the associated verb (*viz.*, past tense and/or past participle).

\* Should ft and fft ligatures be broken up in the past tense and past-participle forms of verbs that do not end in ft but in -fte, -ften, -ftes, -ftest, etc? Example words: *streifte*, *schlürftest*, and *rafften*. Because these suffixes are merely *inflectional* rather than derivational morphemes, the selnolig package does *not* break up the ft and fft ligatures in these cases either. Thus, the words will be typeset as *streifte*, *schlürftest*, and *rafften* rather than as *streifte*, *schlürftest*, and *rafften*.<sup>16</sup>

\* It would also seem OK to use the ft-ligature in expressions such as "zu fünf" and "die zwölfschnellste Sprinterin Bayerns": Even though the t character here represents a deriva-

---

could, instead, rely on the presence of two morphemes to motivate the suppression of the fl-ligature for words such as schweflig, teuflisch, würfle, and Verzweiflung, as their components are schwef|[e]l|ig, etc.

It's fair to say, though, that most modern German speakers would be only vaguely cognizant of the fact that the e1 particle constitutes a separate morpheme in words such as Würfel and Griffel, and that they would be entirely unaware of this fact for words such as Schwefel and Zweifel. To be sure, the typographical convention of *not* using the fl-ligature in words such as schweflig, Verzweiflung, and würfle does *not* appear to be based on the fact that letters f and l in these words belong to different morphemes.

<sup>16</sup>I haven't yet come across any kind of authoritative discussion of this specific case. Should someone be able to furnish a good counterargument to the setting proposed here, I would be happy to change the settings accordingly.

tional morpheme, the ligature occurs at very end of the word or word fragment. In the case of the word “zwölftschnellste”, the argument for keeping the ft ligature is based on the fact that the entire fragment “zwölf” serves a prefix to “schnellste”.

In contrast, the ft-ligature should *not* be used in “Beethoven’s Fünfte Sinfonie” and “zum elften Mal”. Observe that the argument in favor of breaking up the ft-ligature in the words “Fünfte” and “elften” is *not* related to the fact that the words happen to have two syllables and that the syllables are divided between the letters f and t.

- Case 4: A free morpheme *ends* in ft (e.g., Saft, Kraft, Luft, Duft, Haft, and Vernunft) and is joined either to another free morpheme or to a suffix that’s a bound morpheme. Example words: *Säfte*, *Saftladen*, *Kraftfahrzeug*, *Luftagentur*, *duftend*, *bekräften*, *Haftung*, and *vernünftig*. Because the ft character pair doesn’t cross a morpheme boundary, the *selnlig* package does *not* break up the ft ligature. Thus, the words are typeset as *Saftladen*, *Säfte*, *Kraftfahrzeug*, *Luftagentur*, *duftend*, *bekräften*, *Haftung*, and *vernünftig*. The fact that a *syllable boundary* occurs between the letters f and t in some of these words should not affect the decision whether or not to employ the ft (or fft) ligature.

## 4 Structure of the *selnlig* package

### 4.1 The main user commands

The four main user macros of the *selnlig* package are `\nolig`, `\keeplig`, `\uselig`, and `\breaklig`. The first two macros are meant to be used in the preamble, to set up ligature-suppression rules on a document-wide basis. The latter two may be used, as needed, within the body of the document on an *ad hoc* basis to override rules set up by `\nolig` and `\keeplig` instructions.

#### 4.1.1 The `\nolig` macro

The package’s main user macro is called `\nolig`. Each `\nolig` instruction, or rule, takes two arguments: a search string and a string that indicates where the non-ligation “whatsit” should be inserted. E.g., the rule

```
\nolig{lffful}{lf|ful}
```

suppresses the ff-ligature in words such as “shelfful”, “bookshelfful”, and “selffulfilling”.

It is possible to indicate more than one ligature suppression point in the second argument of a `\nolig` rule. For instance, one *could* specify the rule `\nolig{Auflaufform}{Auf|lauf|form}` to suppress both the fl- and the ff-ligature in the word Auflaufform and its plural form, Auflaufformen. For added flexibility, though, the *selnlig* package actually uses two separate `\nolig` rules to suppress the two ligatures in this word; see also [Section 6.3](#).

It is possible to use Lua-style wildcard characters in the search string, as long as these characters occur *after* the non-ligation point. For example, the file *selnlig-german-patterns.sty* employs the rules

```
\nolig{Dorff[aäeilööruü]}{Dorf|f}
\nolig{dorff[aäeilööruü]}{dorf|f}
```

to search for words that contain the strings Dorff and dorff followed by a letter in the set ääeiloöruü.<sup>17</sup> Incidentally, it is not absolutely necessary, in the second argument of the \nolig command, to provide any material *after* the vertical bar that indicates the non-ligation point. However, the readability of your \nolig rules may suffer if you suppress that material.

If you examine the \nolig rules provided in the files selnolig-german-patterns.sty and selnolig-english-patterns.sty, you'll notice soon that there's some redundancy built into the package's ligature suppression rules. For instance, the need to suppress the ff-ligature in the word "auffallen" is catered to both by \nolig{auff}{auf|f} and by \nolig{ffa11}{f|fa11}. This redundancy is there by design, because not all words that might fit one pattern will also fit the other. Providing some redundancy of this type seems like a reasonable way to proceed.

The arguments of the \nolig and \keeplig commands are case-sensitive.

#### 4.1.2 The \keeplig macro

The macro \keeplig{<string>} allows users to create rules that override \nolig rules selectively: for words that contain fragment <string>, the corresponding \nolig rule will not be executed. For a \keeplig rule to work properly, then, the command's argument must be a string that includes *as a subset* a string treated by one or more \nolig rules.

Having the macro \keeplig is very useful because it permits users to specify fewer and more general, i.e., less restrictive, \nolig rules; any Type-II errors that may arise from having \nolig rules whose scope may be insufficiently restrictive can be fixed by providing judiciously chosen \keeplig rules.<sup>18</sup>

Consider the following example: If the ngerman language option is set, the selnolig package uses the rule

```
\nolig{flich}{f|lich}
```

to break up the fl-ligature in words such as begrifflich, beruflisch, brieflich, glimpflich, hilflich, höflich, käuflich, sträflich, tariflich, trefflich, unerschöpflich, and verwerflich (and quite a few more such words), which all contain the suffix lich, a derivational morpheme. This \nolig rule, incidentally, also happens to catch the word "Lauflicht" (which contains the free morphemes Lauf and licht).

It so happens that the scope of this \nolig rule is itself a bit too broad (or, if you will, insufficiently restrictive), as it also catches words such as Pflicht and verpflichten for which the fl-ligature should *not* be suppressed. Rather than provide a large number of slightly more restrictive \nolig rules aimed at avoiding catching the Pflicht- and pflicht-words, the package provides the command

```
\keeplig{flicht}
```

This rule tells selnolig to override the action of the \nolig{flich}{f|lich} rule for all words that contain the string flicht. Most words affected by this \keeplig rule happen to contain the strings "Pflicht" and "pflicht". Interestingly, this rule also preserves the fl-ligature in words such as "flicht" and "verflicht" (the third-person-singular forms of the verbs flechten and verflechten).

---

<sup>17</sup>These particular search strings are used so as not to suppress the ff-ligatures in words that end in either Dorff or dorff, such as is the case with the surnames Dorff and Hausdorff.

<sup>18</sup>In the present context, a Type-II error is the suppression of a ligature that is, in fact, valid for the word at hand.

Probably somewhat surprisingly, at least at first glance, it is *not necessarily* the case that ligatures contained in the argument of a `\keeplig` rule will in fact be used in words that contain the search string associated with the `\keeplig`. Why? It is because, as was noted above, *more than one* `\nolig` rule can apply to a given word. Consider, for instance, the aforementioned word `Lauflicht`: this word happens to be caught by two `\nolig` rules and one `\keeplig` rule (provided in the file `selnolig-german-patterns.sty`):

```
\nolig{auf1}{auf|1}
\nolig{flich}{f|lich}
\keeplig{flicht}
```

Observe that for the word `Lauflicht`, the rule `\keeplig{flicht}` undoes the rule `\nolig{flich}{f|lich}`. However, because the string `auf1` is *not* a subset of the string `flicht`, the rule `\keeplig{flicht}` doesn't undo the rule `\nolig{auf1}{auf|1}`. Hence, the word `Lauflicht` ends up being typeset—correctly—as `Lauflicht`, i.e., *without* the fl-ligature.

Interestingly, the rule `\keeplig{flicht}` is itself a bit too broad because it improperly catches the composite noun `Sumpflicht`, for which the fl-ligature *should* in fact be suppressed.<sup>19</sup> To address this case, the file `selnolig-german-patterns.sty` provides the rule `\nolig{Sumpf1}{Sumpf|1}`; this `\nolig` rule overrides the action of the rule `\keeplig{flicht}` for the word `Sumpflicht`. It also serves to suppress the fl ligature in words such as `Sumpflabkraut` and `Sumpfleiche`.

#### 4.1.3 The `\uselig` macro

The `selnolig` package further provides the user command `\uselig`. It acts much like the `\keeplig` command, but serves to override the action of a `\nolig` rule purely on a one-off basis. E.g., the command `\uselig{fj}` will typeset “`fj`” even if the rule `\nolig{fj}{f|j}`, which suppresses the `fj` ligature on a global, i.e., document-wide basis, is active; *without* `\uselig`, you'd get “`fj`”.

You should use `\uselig` instructions only for single words and word fragments; don't use them for longer stretches of text. If you need to suspend the operation of the ligature suppression macros for longer stretches, including entire paragraphs or more, you should use the macros `\selnoligoff` and `\selnoligon`, which are described in more detail in [Section 6.4](#).

#### 4.1.4 The `\breaklig` macro

The macro `\breaklig`, which doesn't take an argument, is provided as a hopefully easy-to-remember version of the lower-level L<sup>A</sup>T<sub>E</sub>X command “`\- \hspace{0pt}`”. You should insert this macro in places where you want to break up a ligature on an ad-hoc basis and also wish to permit hyphenation. (To suppress a ligature on an ad-hoc basis *without* introducing a potential hyphenation point, insert the instruction “`\kern0pt`”.) For instance, to suppress the `sk` ligature in the word `groundskeeper` on a one-off basis, one might enter it as “`grounds\breaklig keeper`” in order to obtain `groundskeeper` rather than `groundskeeper`.<sup>20</sup>

---

<sup>19</sup>The free morphemes contained in the word `Sumpflicht` are `Sumpf` and `licht`—not `Sum` and `pflicht`!

<sup>20</sup>To suppress the `sk` ligature for this word as well as for words such as `greenskeeper` and `miskeep` everywhere in the document, one could issue the directive `\nolig{skeep}{s|keep}`; the `selnolig` package provides just such a rule.

## 4.2 Components of the `selnolig` package

The `selnolig` package has the following components:

- The main “driver” file is called `selnolig.sty`. It loads several other files and sets up the package’s main user macros, `\nolig`, `\keeplig`, `\uselig`, and `\breaklig`, explained in more detail in the preceding subsection.
- The package’s lua code is in the file `selnolig.lua`.
- The ligature suppression rules for English and German language documents are contained in the files `selnolig-english-patterns.sty` and `selnolig-german-patterns.sty`.
- Supplemental hyphenation exception patterns, mostly for composite words that involve ligatures that are suppressed by the package’s `\nolig` rules, are contained in the files `selnolig-english-hyphex.sty` and `selnolig-german-hyphex.sty`.
- The user guide—the document you’re reading right now—is provided in the file `selnolig.pdf`; the associated source code is in the file `selnolig.tex`.
- Ancillary files: the files `selnolig-english-test.tex` and `selnolig-german-test.tex` load the `selnolig` package as well as either `selnolig-english-wordlist.tex` or `selnolig-german-wordlist.tex`. They serve to demonstrate the output of the `selnolig` package when run on lists of English or German words that are candidates for non-use of ligatures. The files `selnolig-english-test.pdf` and `selnolig-german-test.pdf` contain the results of compiling the test programs. Assuming your `TEX` distribution is either `TEXLive` or `MiKTEX`, you can access these files by typing `texdoc selnolig-english-test` or `texdoc selnolig-german-test` at a command prompt.

The “driver” file `selnolig.sty` starts by setting up several Boolean switches to structure the processing of options. It then loads the file `selnolig.lua`, which contains the package’s lua code and loads the user macros described in the preceding subsection. The remaining steps in the package’s startup process depend on which language-related options, if any, were selected:

- If no language-specific options are in effect, the setup process terminates. Users may, of course, provide their own `\nolig`, `\keeplig`, `\uselig`, and `\breaklig` instructions.
- If the `english` option (or one of its synonymous options) is set, the files `selnolig-english-patterns.sty` and `selnolig-english-hyphex.sty` are loaded. The former file contains a detailed list of `\nolig` and `\keeplig` rules adapted to English language typographic usage; [Appendix A](#) provides a complete listing of these rules. The latter file contains a list of hyphenation exceptions, mainly for words that contain one or more potential non-ligation points and for which `TEX`’s hyphenation algorithm either misses valid hyphenation points or selects invalid hyphenation points; see [Section 6.2](#) below.
- If the `ngerman` option (or one of its synonymous options) is set, the files `selnolig-german-patterns.sty` and `selnolig-german-hyphex.sty` are loaded. The former file contains ligature suppression rules appropriate

for German typographic usage; [Appendix B](#) lists its contents. The latter file provides additional hyphenation rules for German-language words.

- If the user specifies both the `english` and `ngerman` options (or some of their synonymous options), *both* language-specific style files will be loaded. Under normal circumstances, a user will probably want to load only one or the other set of language-specific files, but not both.

The following is an admittedly rough and rather imperfect indication of just how much more complex the task is of creating a set of ligature suppression rules for German than it is for English: As of the mid-May 2013 version of the `selnlig` package, the “basic” set of English language ligature suppression rules for “common” f-ligatures consists of 32 `\nolig` and 17 `\keeplig` directives.<sup>21</sup> In contrast, the set of German language ligature suppression rules for “common” f-ligatures consists of roughly 700 `\nolig` and 335 `\keeplig` directives. A ratio of roughly 1:20 in terms of detail and complexity!

## 5 Additional ligature-related matters

### 5.1 The package’s main language options

The `selnlig` package currently offers two main language-specific options:

- `english`; synonyms: `british`, `ukenglish`, `UKenglish`, `american`, `usenglish`, `USenglish`, `canadian`, `australian`, and `newzealand`.
- `ngerman`; synonyms: `german`, `austrian`, `naustrian`, `swiss`, and `swissgerman`.

These language options may be used either individually or jointly. Indeed, this user guide was compiled with both the `english` and `ngerman` options set.

The English and German ligature suppression rules are listed in [Appendices A](#) and [B](#), respectively.

### 5.2 The `noftligs` option

By default, the `selnlig` package will load rules to suppress ft and fft ligatures selectively, for both English and German documents. In case you want to suppress these two ligatures *globally* rather than selectively, you could specify the option `noftligs` when loading the package. Doing so will make the package set up the simple rule `\nolig{ft}{f|t}`.<sup>22</sup>

### 5.3 English language case: The `broadf` and `hdlig` options

The ligature suppression patterns for English language words, contained in the file `selnlig-english-patterns.sty` and listed in [Appendix A](#) below, are grouped into four parts. The first two parts concern the suppression of

---

<sup>21</sup>Including the rules that are activated if the `broadf` and `hdlig` options are both activated, the tally rises to about 420 `\nolig` and 52 `\keeplig` instructions.

<sup>22</sup>Especially for the German language case, suppressing ft and fft ligatures *globally* will also speed up compilation, as the package will have roughly 180 `\nolig` and 60 `\keeplig` instructions fewer to load.

f-ligatures. Part 1 provides a fairly limited, or “basic”, set of patterns that will always be executed, and Part 2 contains a broader set of ligation suppression rules that will be executed if the `broadf` option is specified.

For English-language documents, only a fairly limited number of f-ligature suppression rules is enabled by default, i.e., if the `broadf` option is not enabled. Eliminating *all* f-ligatures that cross morpheme boundaries simply does not appear to be a major concern in English-language typography. Whereas many (maybe most?) people would agree that it’s advisable not to use the ffi-ligature in words such as chaffinch and wolffish, and not to use the ffl-ligature in words such as scofflaw and offload, there appears to be much less of a perceived need to suppress the fi (ffi) ligature in the far more commonly occurring words that end in f (ff) followed by the particles -ing, -ish, -ier, -iest, -ily, and -iness.<sup>23</sup> The same goes for the fl (ffl) ligature in words that end in f (ff) followed by -ly.<sup>24</sup> That is why only a few f-ligature suppression rules are enabled by default if the `english` option is set. To enable the broader set of f-ligature suppression rules, users must set the `broadf` option explicitly.

My choices regarding which f-ligature suppression rules belong to the “basic” and “broadf” groups are almost entirely pragmatic. They are certainly not based on any overriding English-language typographic principles (which, possibly, don’t even exist). However, if anyone happens to have a strong view on whether either *fewer* or *more* f-ligature suppression rules should be included in the “basic” group—especially if you can provide references to such discussions in learned circles—I would love to hear from you.

Part 3 of the file `selnolig-english-patterns.sty`, which is enabled if the `hd1ig` option is set, provides ligature suppression rules for the `et`, `st`, and `sh` ligatures. Examples are words such as arctangent (not: ar<sup>t</sup>angent), painstaking (not: pain<sup>t</sup>aking), mistake (not: mistake), and trespass (not trespass).

Setting the `hd1ig` option also enables ligature suppression rules for additional discretionary ligatures such as `th`, `at`, and `et`. These ligatures might be deemed inappropriate for use in words such as *lighthouse*, *pothole*, *aromatherapy*, *albatross*, *ninety*, and *nonetheless*. With the `hd1ig` option set, these words will be typeset as *lighthouse*, *pothole*, *aromatherapy*, *albatross*, *ninety*, and *nonetheless*. Ligature suppression rules are provided for the following discretionary ligatures, which occur only in the *italic* font shape of the font families used in this document: `th`, `at`, `et`, `as`, `is`, `us`, `ll`, `fr`, and `sk`. Part 3 of [Appendix A](#) lists these rules.

Part 4 of the file `selnolig-english-patterns.sty`, which is also processed if the `hd1ig` option is set, deals with cases where one discretionary typographic literature, say `as`, might pre-empt the use of a more appropriate but trailing typographic ligature, say `ſt` or `ſh`, in words such as *fast* → *fast* and *clasp* → *clasp*. Note that the issue being addressed in this part is not that of a ligature improperly spanning a morpheme boundary; instead, it is the possibility that TeX might pre-empt one typographic ligature with another ligature within one and the same morpheme. This issue is discussed in more detail in [Section 5.7](#) below.

#### 5.4 Composite words with ambiguous morphology

There may be pairs of composite words which look alike but are made up of two different pairs of morphemes. For instance, the German words *Saufladen* and *Wachstube* may be constructed as *Saufladen*/*Saufladen* and as *Wachs-tube*/*Wach-stube*, respectively. In one case, using the fl and st ligatures would be wrong; in

---

<sup>23</sup>Examples of such words are surfing, oafish, leafier, goofiest, fluffy, and goofiness. With the `broadf` option set, these words will be typeset as surfing, oafish, leafier, goofiest, fluffy, and goofiness.

<sup>24</sup>Examples are aloofly and gruffly; with the `broadf` option set, these words will be typeset as aloofly and gruffly.

the other, using the ligatures would help greatly in indicating the intended meaning of the composite words. For words such as these, software isn't smart enough to "discern" which possible meaning is intended.<sup>25</sup> Writers, of course, could (and should?) choose to insert explicit hyphen characters to indicate the intended meaning.

The preceding two examples each involve two pairs of free morphemes. Further, potentially more complicated, cases can occur. For instance, the composite word `optSurftest` can have a meaning that involves a free morpheme and an inflectional morpheme (indicating the past-tense use of the verb), whereas the other meaning involves two free morphemes. Consider the questions "Surftest Du vergangene Woche in Hawaii?" and "Hat die Athletin den Surftest bestanden?" In the second question, it's wrong to use the `ft`-ligature; the word `Surftest` is therefore entered as "`Surf\breaklig test`".

An even more complicated example is the word `Chefinnenleben`, which contains three morphemes. This word can be deconstructed either as `Chefinnen-leben` ("lives of female bosses") or as `Chef-innenleben` ("inner life, or lives, of a boss"); the word's middle particle—"innen"—can function both as a suffix to "Chef" and as a prefix to "Leben", the word's third morpheme. Only in the second case is it wrong to use the `fi`-ligature. Software isn't smart enough yet to discern on its own which meaning is intended.

The rules of the `selnolig` package are set *not* break up the `fi`-ligature in the shorter words `Chefin` and `Chefinnen`, in keeping with the principle that the `fi`-ligature is permitted for suffixes that start with an "i". In contrast, `selnolig` will break up the `fi`-ligature in the longer words `Chefinnenleben` and `Chefinnenräume`, because in these cases the working assumption is that `innen` acts as a prefix to the third morpheme (Leben or Räume). If this is *not* what you want, i.e., if you really do mean to refer to lives or spaces of female bosses, be sure to use `\uselig{fi}` instructions to preserve the `fi`-ligatures. Better yet, use explicit hyphens: `Chefinnen-Leben` and `Chefinnen-Räume`. And, while you're at it, do consider writing the other forms as `Chef-Innenleben` and `Chef-Innenräume`. Your readers will thank you.

Summing up: There are words for which it's not possible to decide without knowledge of the context within which the word is used whether or not a given ligature should be suppressed. The best advice I can give is to be on the lookout for such words and to take corrective action if `selnolig`'s default choice is wrong.

## 5.5 How to provide additional ligature suppression patterns

As already noted, it's not possible to claim that the non-ligation rules provided in `selnolig-english-patterns.sty` and `selnolig-german-patterns.sty` are complete or, for that matter, will *ever* be complete. If you come across words containing ligatures that ought to be suppressed but aren't caught (yet) by the `selnolig` package, you could do the following. First, you could insert `\breaklig` instructions to suppress the ligatures on a case-by-case basis; conversely, if you discover an instance for which `selnolig` improperly breaks up a ligature, you could override that action by encasing the character pair (or triple) in a `\uselig` statement. Second, you could create your own `\nolig` and `\keeplig` rules to deal with the cases you've discovered on a document-wide basis. A third option, naturally, is to bring this case to the attention of the maintainer of the `selnolig` package and ask him/her to update the package's ligature suppression rules...

---

<sup>25</sup>It turns out that if the `ngerman` option is set and the `babel` package is loaded as well, the `selnolig` package will break up the `fl` ligature in `Saufladen` but not the `st` ligature in `Wachstube`, i.e., the words will be typeset as "Saufladen" and "Wachstube", respectively. If that's *not* what you want, you'll need to mark up the words explicitly as follows: `\uselig{Saufladen}` and `Wachs\breaklig tube`.

To give an extended example of how one might go about augmenting the set of ligature-suppression rules already provided by the `selnolig` package, suppose that you've been tasked with preparing a special edition of Thomas Mann's novel *Der Tod in Venedig*. Suppose further that you have chosen to use an "Antiqua" ("Roman") font—which, naturally, features a ligature for the `ffl` character triple—to typeset this special edition, because fewer and fewer people nowadays can manage to read with ease text set in a **period-appropriate blackletter font**. During your preparations, you happen to notice (i) that the novel contains the word `inbeg riffleitend`<sup>26</sup> and (ii) that the `selnolig` package does not (yet) appear to provide a rule that suppresses the `ffl`-ligature for this word.

To meet the need to suppress the `ffl`-ligature in `inbeg riffleitend`, you could insert a `\breaklig` instruction, i.e., enter it as "`inbeg riff\breaklig leitend`". (Doing so isn't inefficient in the present example because the word `inbeg riffleitend` occurs exactly once in the novel.) Alternatively, you could devise a new `\nolig` rule to catch this word. For instance, you could add the following `\nolig` rule (to be inserted in your document's preamble, after the `selnolig` package has been loaded) to suppress the `ffl` ligature in `inbeg riffleitend` as well as in the far more common words `Jugendtreffleiter` and `Kunststoffleitung`:

```
\nolig{ffleit}{ff|leit}
```

With this rule in place, the words will be typeset as `inbeg riffleitend`, `Jugendtreffleiter`, and `Kunststoffleitung`, respectively. Just in case this discussion has made you curious: the file `selnolig-german-patterns.sty` provides the more general (i.e., less restrictive) rule `\nolig{fleit}{f|leit}` to catch these words.

When designing your own `\nolig` and `\keeplig` rules, you would ideally do so in a way that ensures that the rules are neither too specific (and hence only apply to a very small set of words) nor too general (and hence end up applying to words for which the rule wasn't meant to apply). Of course, this may be easier said than done. Consider, say, what would happen if you came up with the rule

```
\nolig{flei}{f|lei}
```

This rule would certainly succeed in breaking up the `ffl`-ligature in the words `inbeg riffleitend`, `Jugendtreffleiter`, and `Kunststoffleitung`. It will also break up the `fl`-ligature in `Laufistung`, `Häuflein`, `Kreislaufleiden`, `Scherlein`, and many more words. However, this rule would also *incorrectly* break up the `fl`-ligature in many other words, including `fleissig/fleißig`, `fleischig`, `Hackfleisch`, and `Diplomfleißarbeit`; I believe most readers would prefer to see these words typeset *with* the `fl`-ligature, i.e., as `fleissig/fleißig`, `fleischig`, etc. When in doubt, try to err on the side of making your `\nolig` rules a bit too restrictive.

## 5.6 How to use the `selnolig` package to suppress certain ligatures *globally*

The main purpose of the `selnolig` package is, obviously, to disable certain ligatures selectively. However, it can also be used to suppress ligation globally for selected character pairs.<sup>27</sup>

---

<sup>26</sup>This word really does occur in the aforementioned novel! This novel may very well also be the *only place* ever where you'll encounter this word. I performed a Google search for the term "inbeg riffleitend"; the only hits, apart from online editions of the novel itself, were the sites of a couple of French bloggers who agonized over how this word might possibly be translated from German to French...

<sup>27</sup>I first became aware of the potential need for such a feature from reading Frank Mittelbach's posting, [Suppress certain ligatures generally](#), on [tex.stackexchange.com](https://tex.stackexchange.com).

For instance, suppose that you are typesetting a Turkish text. The Turkish alphabet features both a dotted i and a dotless i character. I understand that in Turkish typesetting practice, the fi and ffi ligatures should *never* be employed, so as to avoid creating any doubts as to whether it's an i or an ī character that follows the "f" character. To satisfy the need of Turkish typography for global suppression of the fi and ffi ligatures, one could issue the command

```
\nolig{fi}{f|i}
```

in the document's preamble.

Or, suppose that you have a font that provides ligatures for the fb, fh, fj, and fk character pairs (as well as, possibly, the ffb, ffh, ffj, and ffk character triples). If you wanted to suppress the four former f-ligatures globally (and also break up the latter ligatures into ffb, ffh, ffj, and ffk, respectively), you could do so by issuing the following commands:

```
\nolig{fb}{f|b}
\nolig{fh}{f|h}
\nolig{fj}{f|j}
\nolig{fk}{f|k}
```

In fact, these commands are activated automatically if the `ngerman` or `english` language options are set. This is done because I was unable to come up with a single instance of a *German* or *English* language word involving these character combinations that doesn't also involve a morpheme boundary collision.

Of course, your document may contain words *not* of German or English origin that contain some of these character pairs and do not involve a morpheme boundary crossing; for such words, it is not desirable to suppress the corresponding ligatures. One such word is *Kafka*: one may not wish to suppress the fk-ligature for this specific word. The `selnolig` package provides `\keeplig` rules to preserve the fk-ligature in names such as *Kafka*, *Safka*, *Piefke*, *Potrafke*, *Sprafke*, *Shirafkan*, *Tirafkan*, and *Rifkin*.<sup>28</sup>

Your documents may also feature words of *Nordic* origin that contain the fj character pair, such as *Sognefjord* and *Dovrefjell*. Because the fj character pair in these words does not span a morpheme boundary, the fj-ligature should not be broken up; i.e., the words should be typeset as *Sognefjord* and *Dovrefjell*, respectively. The package therefore provides `\keeplig` rules to take care of (a) words that contain the particles *fjord*, *fjör*, *fjell*, and *fjäll* and (b) names such as *Eefje*, *Sufjan*, *Prokofjew*, and *Astafjew*.

A "rare" typographic ligature that may warrant global suppression, at least for English language documents, is *ij*.<sup>29</sup> To the best of my knowledge, a morpheme boundary crossing occurs for all English language words that contain the ij character pair: *antijam*, *bijection*, *demijohns*, and *hijack*. By the logic set forth above, this ligature should therefore be suppressed for all of these words.<sup>30</sup> The ij ligature also seems inappropriate for most words that came into English from languages such as French, Japanese, and Spanish, including *bijou* (jewel), *gaijin* (foreigner), *jipijapa* (Panama hat), and *marijuana* (Maryjane). (What? Were you maybe

---

<sup>28</sup> Aside: It was Felix Lehmann's desire to preserve the fk ligature in the name "Kafka" that stimulated the creation of the package's `\keeplig` macro. Of course, once the `\keeplig` macro was created, I quickly discovered all kinds of further uses for it.

<sup>29</sup> For many fonts I'm familiar with, including the one used for this user guide, the ij character pair is available in the upright font shape as a *digraph* rather than as a true, i.e., joined-up, ligature.

<sup>30</sup> If this ligature weren't suppressed, the preceding words would be typeset as *antijam*, *bijection*, *demijohns*, and *hijack*.

thinking of a different meaning of this word? How come?!) The *ij* ligature is therefore suppressed *globally* by the `selnolig` package if the options `english` and `hdlig` are set. However, this ligature *does* get used a lot in Dutch. Thus, the `selnolig` package issues various `\keeplig` directives so that this ligature isn't suppressed for some names and words of Dutch origin, such as *de Bruijn* and *rijſtafel*.<sup>31</sup>

### 5.7 What if one ligature pre-empts a trailing, more appropriate ligature?

If a font provides many discretionary ligatures, the likelihood is high that words will occur for which the use of a ligature for the first two characters of a character *triple* might pre-empt the use of a more appropriate ligature for the last two characters of that triple.<sup>32</sup>

In this section, we examine the use of `\nolig` rules to address this contingency, focusing on cases of *ſt*, *ſp*, *th*, and *ta* character pairs being preceded by character pairs (for which the font provides ligatures) that end in *s* or *t*, respectively. This focus is dictated largely by the discretionary ligatures provided by the main text font used for this user guide (Garamond Premier Pro). Other ligature-rich fonts may provide further possibilities for one ligature inappropriately pre-empting that for a trailing character pair.<sup>33</sup>

Ligatures for *as*, *is*, and *us* that pre-empt an *ſt* ligature

Suppose that the text font in use provides ligatures for the *as*, *is*, and *us* character pairs as well as for the *ſt* character pair. By TeX's rules for forming typographic ligatures, words that contain the character *triples* *ast*, *ist*, or *ust* will see the first two characters ligated, pre-empting the use of a typographic ligature for the trailing *ſt* character pair. There are at least three distinct reasons why this outcome is not desirable.

First, given the rather distinctive look of the *ſt* ligature, the word *stochastic* may look a bit odd if the *ſt* ligature is used only once—*ſtochastic*—simply because the *as* ligature pre-empts the second *ſt* ligature; readers may prefer the look of *ſtochastic*. Second, non-use of the *ſt/ſt* ligature may be undesirable if the same word occurs twice and in close visual proximity, once set in the upright font shape—for which there are no ligatures for the *as*, *is*, and *us* character pairs, and hence for which the issue of ligature pre-emption doesn't arise—and once in italics: *must* and *must*; readers may prefer the look of *must* and *must*. Or, consider the

---

<sup>31</sup>The word *rijſtafel*, incidentally, features three consecutive “rare” ligatures. Another word that contains three rare ligatures, though not consecutive ones, is *isthmus*.

<sup>32</sup>To be sure, the issue of ligature pre-emption is not limited to “discretionary” ligatures; it can also occur with “common” f-ligatures. Suppose, for instance, that a certain font provides *ff*, *fi*, and *fl* ligatures but no *ffi* and *ffl* ligatures, and consider how TeX would typeset words containing *ffi* and *ffl* character triples. Left to its own devices, TeX would let the leading *ff*-ligature pre-empt the trailing *fi*- and *fl*-ligatures, resulting in typographically incorrect outcomes for words such as *wolffish* (better: *wolfish*), *safflower* (*safflower*), *auffinden* (*auffinden*), and *Schaffleisch* (*Schaffleisch*).

<sup>33</sup>For the font Garamond Premier Pro, I've discovered the following peculiar exception to the general rule that TeX always gives precedence to a ligature for the first two characters of a character triple: for the character triple *fis* (as in *fist* and *fish*), TeX gives preference to the trailing *is* ligature over the leading *fi* ligature, causing these words to be typeset as *fish* and *fist*, respectively. I can't tell if this is a conscious design feature or a bug in this font. The `selnolig` package overrides this behavior, i.e., it is set to give preference to the leading *fi* ligature over the trailing *is* ligature for words that contain the strings *fist* and *fish*; hence, they'll be typeset as *fish* and *fist*, respectively.

Note that if the `broadf` option is set, as is the case for the document you're currently reading, a side effect of this setting is that words such as *deafish*, *dwarfish*, *elfish*, *oafish*, *selfish*, *unselfish*, *wolfish*, *draffish*, *giraffish*, *gruffish*, *offish*, *raffish*, *sniffish*, *standoffish*, *ſtiffish*, and *toffish*, as well as the associated adverbs ending in *-ly*, will *not* feature an *is* ligature. This loss is, hopefully, not too serious.

words “historian” and “history” when typesetting them in italics: I’d say it’s much better to typeset them as *historian* and *history* rather than as *historian* and *history*. Moreover, I suspect that Austrians—at least the ones who care about discretionary typographic ligatures...—may prefer to see the name of their country typeset as *Austria* rather than as *Austria*. Finally, do you prefer the look of *Do fast festive fists foster fustiness?* or that of *Do fast festive fists foster fustiness?* You prefer the latter look too? Great!

Third, there may be cases where an *as* ligature not only pre-empts a subsequent *st* ligature but also spans a morpheme boundary, as in the words *infrastructure* and *seastrand*.<sup>34</sup> For such words, the *as* ligature should probably be suppressed in any case to increase the words’ legibility: *infrastructure* and *seastrand*.

The *selnolig* package is set to give preference to the distinctive-looking *ſt* ligature over *as*, *is*, and *us* ligatures. To this end, the following `\nolig` rules are provided.<sup>35</sup>

```
\nolig{ast}{a|st}
\nolig{ist}{i|st}
\nolig{ust}{u|st}
```

Ligatures for *as*, *is*, and *us* that pre-empt an *ſp* ligature

The same three reasons for not letting *as*, *is*, and *us* ligatures pre-empt an *ſt* ligature also apply to the case of the equally distinctive-looking *ſp* ligature. The *selnolig* package therefore provides rules to ensure that the *ſp* ligature is used in words such as *clasſp*, *haſp*, *hiſpanic*, *raſpberry*, *teaspoon*, *waſp*, *criſp*, *lisſp*, *whiſper*, and *cusſp*.

Ligatures for *at* and *et* that pre-empt a *th* ligature

Suppose that a font provides ligatures for the *at*, *et*, and *th* character pairs. By TEX’s rules for forming ligatures, without special intervention the word *mathematics* will be typeset as *mathematics* rather than as *mathematics* because the first *at* ligature pre-empts the *th* ligature. The same happens for words such as *bath*, *Kathryn*, and *pathology*. Given the commonness and the distinctive pronunciation of the *th* character pair in the English language, as well as the high frequency of this character pair in words of Greek origin (for which the Latin-alphabet *th* character pair derives from the single Greek character  $\theta/\vartheta$ ), it seems undesirable to let the *at*-ligature pre-empt the *th* ligature for these words.

Fixing the *at-th* ligature pre-emption issue globally—e.g., via `\nolig{ath}{a|th}`—is not completely innocuous, though, because doing so will also suppress the *at* ligature for words such as *boathook*, for which the *th* ligature would span a morpheme boundary and thus shouldn’t be employed anyway. For such words, then, there’s no need to suppress the *at* ligature. These cases are dealt with by providing specific `\keeplig` rules to re-enable the use of the *at* ligature.

Suppressing an *et* ligature in favor of a subsequent *th* ligature via `\nolig{eth}{e|th}` is almost universally correct, either because the *th* ligature *should* take precedence—as in the words *ethics*, *methane*,

---

<sup>34</sup>This case was already noted in Footnote 32. There, two words (*wolffish* and *Schaffleisch*) are mentioned for which the *ff*-ligature would improperly pre-empt *fi-* and *fl*-ligatures *and* happen to span a morpheme boundary.

<sup>35</sup>The second of these three commands, while correct for most words that contain the string *ist*, unnecessarily suppresses the *is* ligature for words for which the *ſt* character pair crosses a morpheme boundary, e.g., words that start with *dis-t...*—e.g., *distend*, *distribute*, *distrust*, *disturb*—or with *mis-t...*—e.g., *mistake*, *mistranslate*, *mistype*. (Note that separate `\nolig` rules already suppress the *ſt/ſt* ligature for these words.) At this time there are no plans to address this (overall hopefully minor?) issue.

and *teeth*—or because the *et* ligature would cross a morpheme boundary and hence shouldn’t be used anyway, as in the words *forethought* and *rethink*. I say that it’s *almost* universally correct to do so; however, there are some words, such as *Beethoven*, *prophethood*, and *sweetheart*, for which the *th* ligature would be inappropriate anyway and for which the use of the *et* ligature would hence be unproblematic. To address this issue, \keeplig rules are provided to override the rule \nolig{eth}{e|th} for these words, so that they’ll get typeset as *Beethoven*, *prophethood*, and *sweetheart*.<sup>36</sup>

Ligatures for *at* and *et* that pre-empt a *ta* ligature

There seem to be very few English words for which an *at* ligature might inappropriately pre-empt a *ta* ligature. One such word is *atap*, whose readability is enhanced if it’s typeset as *atap* rather than as *atap*.

Virtually all words for which an *et* ligature might inappropriately pre-empt the use of a trailing *ta* ligature appear to be words for which the *et* ligature crosses a morpheme boundary and should be suppressed. Examples are *betake*, *betatter*, *brisletail*, *caretaker*, *detach*, *dovetail*, *foretaste*, *pretax*, *retable*, *retack*, *retard*, *retarget*, *timetable*, and *wiretap*. The *et*-related ligature suppression rules already put in place to deal with morpheme boundary crossing cases should therefore suffice to catch these cases as well.

Do be on the lookout for cases of persons’ names which include the string *eta* and for which the trailing *ta* ligature should not be pre-empted by the leading *et* ligature. For instance, the author of this package prefers to see his surname typeset as *Loretan* rather than as *Loretan...*

## 6 Further issues

### 6.1 Known bugs

I’m not sure if the following matter constitutes a bug or “merely” a case of incompatibility between two L<sup>A</sup>T<sub>E</sub>X packages. The *selnolig* package does not appear to interact well with the L<sup>A</sup>T<sub>E</sub>X package *ngerman*. The *selnolig* package *does* interact nicely with the *babel* package if one of the options *ngerman*, *german*, *austrian*, *naustrian*, *swissgerman*, or *swiss* is set. Unless someone can convince me that using the *ngerman* package is truly preferable to using the *babel* package, I probably won’t bother addressing this incompatibility.

### 6.2 Supplementary hyphenation exception patterns

T<sub>E</sub>X’s hyphenation algorithms are widely acknowledged to be very good. However, for the English language case at least, it tends to miss quite a few permissible hyphenation points when dealing with words that end in *-f-ing*, *-f-ier*, *-f-iest*, *-f-less*, *-f-like*, etc. Hyphenation exception lists are provided in the files *selnolig-english-hyphex.sty* and *selnolig-german-hyphex.sty*, respectively, for English and German words.

The German-language hyphenation exception list is currently still the shorter of the two; however, this may change in the future. The German word list is shorter in part because it is assumed that writers of German-language documents use the *babel* package and select the option *ngerman* (or one of the synonymous language options); doing so also loads specialized hyphenation patterns suitable for German texts.<sup>37</sup>

---

<sup>36</sup>Note that this method works if the font being used provides both *et* and *th* ligatures. If the text font you employ provides only a *th* ligature but no *et* ligature, these \keeplig rules should be disabled.

<sup>37</sup>As was already noted earlier, the *selnolig* package is also compatible with the *hyphsubst* package.

It is possible to instruct `selnolig` *not* to load the package’s hyphenation exception lists. You may want to do so, for instance, if you must use UK-English hyphenation patterns and therefore shouldn’t use the US English-based hyphenation patterns provided by the package. (To the best of my knowledge, most of the hyphenation patterns employed in `selnolig-english-hyphen.sty` are common to UK and US English.) To skip loading the additional hyphenation patterns when invoking the `selnolig` package, you should specify the option `noadditionalhyphenationpatterns`. (I am obviously not trying to make it too easy to invoke this option ...)

As was already noted in [Section 2.3](#), if you use the `babel` package with, say, the `ngerman` option, be sure to load `selnolig` package *after* the `babel` package. That way, the `selnolig` package’s additional hyphenation exception patterns won’t be overridden by `babel`’s settings.

Incidentally, if the files `selnolig-english-hyphen.sty` and `selnolig-german-hyphen.sty` are located in a directory that’s in the search path of your TeX distribution, these packages may be loaded via the usual `\usepackage` statements without having to load the entire `selnolig` package.

### 6.3 Ancillary information about the package’s activity

If you execute the command `\debugon`, detailed information about each `\nolig` and `\keeplig` pattern match that is encountered is written to the `.log` file. (The package’s default setting is `\debugoff`.)

Because of the potential redundancy in some of the package’s `\nolig` commands, it is possible that more than one pattern match will occur for a given word. E.g., for the verb “auffahren”, two separate `\nolig` commands apply simultaneously, *viz.*, `\nolig{auff[aeiloruyäöü]}{auf|f}` and `\nolig{ffahr}{f|fahr}`. For this word, the following information is written to the `.log` file:

```
pattern match: auffahren - auff[aeiloruyäöü]
pattern match: auffahren - ffahr
Do ligature suppression for: auffahren
Inserting nolig whatsit before glyph: f
Last char: n
```

It is also possible that words are found with more than one ligature suppression point. For example, if the word “Auflaufform”—which happens to have both an `fl`- and an `ff`-ligature that should be suppressed—is encountered, the following lines are written to the `.log` file; note that in this case, two separate `\nolig` commands “catch” the `fl` and `ff` ligatures:

```
pattern match: Auflaufform - flauf
pattern match: Auflaufform - Aufl[aeiouyäöü]
pattern match: Auflaufform - auff[aeiloruyäöü]
pattern match: Auflaufform - fform
Do ligature suppression for: Auflaufform
Inserting nolig whatsit before glyph: l
Inserting nolig whatsit before glyph: f
Last char: m
```

If both a `\nolig` and a `\keeplig` command apply to a word—as is the case for `fjord`, to which both `\nolig{fj}{f|j}` and `\keeplig{fjord}` apply—the following (mercifully short) bit of information is written to the `.log` file:

```
pattern match nolig and keeplig: fjord - fj - fjord
```

If more than one `\nolig` rule *as well as* a `\keeplig` rule apply to a given word, as is the case for the word “`Streiflicht`”, the following information is written to the `.log` file:

```
pattern match nolig and keeplig: Streiflicht - flich - flicht
pattern match: Streiflicht - reifl
Do ligature suppression for: Streiflicht
Inserting nolig whatsit before glyph: 1
Last char: t
```

Observe that the first `nolig` rule’s pattern, `flich`, is overridden by the `keeplig` rule’s pattern `flicht`. The second `nolig` rule’s pattern, `reifl`, is *not* overridden, and it is the debugging-related information associated with the second `\nolig` pattern that ends up being written to the `.log` file.

To terminate or suspend the writing of the debugging-related information to the `.log` file, one may execute the command `\debugoff`. To restart the logging of this information, issue the command `\debugon`.

#### 6.4 Suspending and restarting the operation of `selnolig`’s macros

By default, `selnolig`’s macros are switched on (assuming, of course, that your document is compiled under Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub>). If you want to suspend their operation, you should issue the command

```
\selnoligoff
```

at the desired point in your document. Conversely, if `selnolig`’s macros need to be switched back on, just issue the command

```
\selnoligon
```

#### 6.5 Lists of words that fit German and English non-ligation patterns

Extensive lists of German and English language words for which one or more ligatures should be suppressed are provided in the supplemental files `selnolig-german-test.pdf` and `selnolig-english-test.pdf`. I started the list of German language words with the examples provided by the `rmligs` script; I’ve added quite a few more words to that list in the meantime. Thanks to the great work of Felix Lehmann and Steffen Hildebrand, explained in more detail in [Section 8](#), the package’s German language search patterns actually apply to a much larger number of words than those listed in `selnolig-german-test.pdf`. Naturally, suggestions for still more words to be de-ligated are always welcome.

The files `selnolig-german-test.tex` and `selnolig-english-test.tex` are “driver programs” that load the `selnolig` package and then run it on the respective lists of German- and English-language words. To compile the driver programs, be sure to use Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub>.

## 7 Making suggestions and reporting bugs

Feedback on the `selnolig` package is always welcome, whether for making general suggestions or for reporting bugs and other problems. [Emailing me](#) about `selnolig` will definitely get my attention. I'm also a fairly active participant on [tex.stackexchange.com](https://tex.stackexchange.com). In case I appear to miss any `selnolig`-related discussions on that site, don't hesitate to contact me to alert me to them.

When reporting what you believe to be shortcomings and/or mistakes with the package's ligature suppression rules, please use a structure similar to the template given in [Appendix F](#) of this document.

If anyone is thinking of creating rules to suppress ligatures selectively for languages other than English and German and would like to make use of the "machinery" provided by the `selnolig` package, I'd be delighted to provide reasonable amounts of programming-related assistance.

The latest versions of all files that comprise the `selnolig` package may be found at the [package's GitHub site](#). What's there may be slightly more up to date than what I manage to push to the [CTAN page](#).

## 8 License and acknowledgments

The entire `selnolig` package is placed under the terms of the L<sup>A</sup>T<sub>E</sub>X Project Public License, version 1.3 or later (<http://www.latex-project.org/lpp1.txt>). It has the status "maintained".

I owe a huge intellectual and programming debt to Patrick Gundlach and Taco Hoekwater, who responded kindly and generously with detailed computer code to various queries I posted to [tex.stackexchange.com](https://tex.stackexchange.com).<sup>38</sup> Without their help and support, this package would not exist. They certainly deserve most of the credit for the lua code used by the `selnolig` package.

Felix Lehmann (a linguist and expert in morphology, i.e., the study of morphemes) and Steffen Hildebrandt (computer scientist extraordinaire) served as patient and careful testers of several early beta versions of this package, uncovering and fixing bugs, pointing out unclear passages in the user guide, writing scripts to automate the discovery of redundancies and syntax errors in the package's `\nolig` and `\keeplig` rules, and providing many excellent suggestions for improving the package. Steffen also provided crucial modifications to the package's lua code to make possible the `\keeplig` and `\uselig` macros.

Equally importantly, Felix and Steffen created scripts to test systematically and comprehensively the package's German `\nolig` and `\keeplig` rules for linguistic adequacy and (relative) completeness. They began with a corpus of almost 850 million [!!] words, which they marked up with information on the morphological constituents of each word. From this huge word list, they extracted a set of 462,000 unique word forms containing potential f-ligatures. According to their analysis, an early version (late October 2012) of the `selnolig` package already dealt correctly with 85 percent (394,000) of those word forms, while still generating 21,000 Type I errors and 48,000 Type II errors!<sup>39,40</sup> Fortunately (for me at least), they also discovered that a non-negligible part of the 69,000 errors wasn't real but, rather, the result of typos in the

---

<sup>38</sup>See especially the questions [Any suggestions/requests for features for a new package that allows disabling ligatures for \(pre\)selected words?](#), [How to suppress the operation of a luatex-defined macro on a string if the string is part of macro or a label,](#) and [Ligature suppression algorithm fails if the word in question contains an Umlaut \(dieresis\) before the ligature.](#)

<sup>39</sup>In the context of the `selnolig` package, a Type I error is the failure to suppress a typographically inappropriate ligature, and a Type II error is the improper suppression of a typographically appropriate ligature.

<sup>40</sup>1,000 words contained more than one potential f-ligature, hence the difference.

words included in the corpus and/or of incorrect morphological analysis. The detailed Type I and II error lists they generated were critical in helping me refine—and occasionally revise completely—the package’s `\nolig` and `\keeplig` rules, rapidly bringing down the number of Type I and II errors.<sup>41</sup> All major changes to the German language ligature suppression patterns are still being subjected to their testing algorithms to streamline the tasks of detecting what’s left to improve and catching any newly introduced errors.

Felix and Steffen started the automated testing of the package’s `\nolig` and `\keeplig` rules as their finals project for the course *Introduction to Computational Linguistics* at the University of Massachusetts at Amherst in the fall of 2012.<sup>42</sup> They wish to thank the Institut für Maschinelle Sprachverarbeitung at the Universität Stuttgart for granting them a license for the morphological analysis tool SMOR<sup>43</sup> and, in particular, Helmut Schmid for his guidance. They also express their gratitude to the *Web-as-Corpus kool ynitiative (WaCky)* for letting them use the SDeWaC corpus,<sup>44</sup> as well as to Rajesh Bhatt (University of Massachusetts at Amherst), Miriam Butt (Universität Konstanz), and Sabine Schulte im Walde (Universität Stuttgart) for helping them find the right resources for their project.

The `rmligs` script lists hundreds of German language words for which various f-ligatures should be suppressed. I created many of the initial German language ligature suppression rules of the `selnolig` package to treat the words listed in the `rmligs` package.<sup>45</sup>

Matthias Vogel very kindly shared with me a set of regular-expression based ligature suppressing macros, named `Ligatures-German`, he wrote for the WinEdt programmer’s editor. Matthias’s macros work by inserting babel-style “| ligature-suppressing directives in the appropriate places in the .tex file, which can then be compiled with pdfLATEX. These macros, and a file he sent me containing an extensive list of German words for which one or more f-ligatures should be suppressed, led me to thoroughly refine and extend the scope of the `selnolig` package’s German language ligature suppressing rules.

Barbara Beeton provided detailed and incisive comments on an early version of the package’s user guide and its English language ligature suppression rules.<sup>46</sup> David Bellows provided a suggestion that led me to extend some of the `\nolig` rules in Part 2 (activated by setting the option `broadf`) of the file `selnolig-english-patterns.sty`. Other contributors to `tex.stackexchange.com` and `comp.text.tex`, too numerous to name individually, also helped guide and influence the genesis of this package. To all of you, I express my sincere thanks.

The website <http://www.morewords.com> provides very convenient methods for searching English language words that may contain cases of ligature collisions across morpheme boundaries. For German words, the site <http://corpora.informatik.uni-leipzig.de/?dict=de> provides a similar resource.

---

<sup>41</sup> For instance, after Steffen wrote the lua code that made possible the `\keeplig` macro, I was able to eliminate, in one fell swoop, more than 10,000 [!!] Type II errors generated by the package’s earlier, incorrect suppression of the f-ligature in words that contain the morpheme `pflicht`.

<sup>42</sup> Their [code](#) and [finals paper](#) is available online.

%% If you have 'at' and 'et' ligatures as
%% well as the 'th' ligature and want a
%% trailing 'th' ligature to take precedence
%% over these ligs, use the following rules:
\nolig{ath}{a|th}
\nolig{eth}{e|th}

% The preceding rules are a bit too
% broad as they also suppress the 'at' ligature
% for words such as boathook and flathead
% and the 'et' ligature in words such as
% Beethoven, prophethood, and sweetheart.
% Thus, also provide some \keeplig macros:

\keeplig{oathook} % boathook
\keeplig{eathook} % meathook
\keeplig{athouse} % bathouse boathouse cathouse
%%\keeplig{rathole} % this will re-enable "th" liga
%%\keeplig{Rathole} % if "at" liga doesn't exist...

## B German-language ligature suppression rules: selnolig-german-patterns.sty

Introductory note: To accommodate the practice of Swiss-German writers of not using the “ß” character and using “ss” in its place, all search-and-insert strings that contain an “ß” character are duplicated with equivalent search-and-insert strings containing “ss”.

```
% !TeX root = selnolig.tex
% !TEX TS-program = lualatex

% terms of the LaTeX Project Public License,
% version 1.3 or later
% (http://www.latex-project.org/lppl.txt).
% It has the status "maintained".
%
% Author: Mico Loretan
% (loretan dot mico at gmail dot com)

% A note on the organization of the \nolig
% macros in this file: They are grouped by
% the f-ligature being suppressed: ff -> f-f;
% fi -> f-i, fl -> f-l, etc. Within each of
% these sections, the \nolig commands are
% listed first for word-beginnings and
% second by word-interior search strings,
% alphabetically within each group.

% 1. ff -> f-f

## E A case study: f-ligatures suppressed in Thomas Mann's *Die Buddenbrooks*

As noted in the introduction, in English language documents the suppression of ligatures that cross morpheme boundaries is generally not considered to be an urgent typographical priorities, quite possibly because ligatures that cross morpheme boundaries don't arise frequently. I did a quick check of this claim by compiling Jack London's novels *Call Of The Wild* and *The Sea Wolf*, obtained from Project Gutenberg's site in plain-text format, with *selnlig*. Sure enough, in *Call Of The Wild* only one f-ligature is suppressed: the "ff" in wolflike/wolflike. In *The Sea Wolf*, again only one f-ligature is suppressed: the "ft" in fifth/fifth. Not exactly a lot of words, right?!

The situation is quite different for German texts. E.g., in Thomas Mann's novel *Die Buddenbrooks*, more than 440 words are caught by *selnlig*'s rules; they are listed below. Incidentally, the fi-ligature in the words Kaufinger and Kaufingerstraße is suppressed because "Kaufinger" ("chew-finger") looks unintentionally hilarious.

f- lig.	Words for which the f- lig. is suppressed by <i>selnlig</i> 's rules
fb, ffb	Aufbahrung, aufbegehrte, Aufbewahrungsort, Aufbietung, aufblicken, aufblitzenden, aufblitzt, aufblitzten, aufblühende, aufbrach, aufbrechen, aufbringen, aufbringt, Aufblick, Aufbrausen (2), Aufbruch (4), Briefbeschwerer, Dampfbrot, daraufbringen, greifbaren, Greifbares, heraufbefördert, hinaufblickte, Hofbräu, Hofbräuhaus (3), Hofbräuhaus, Kopfbewegung (3), Kopfbewegungen, Krippeaufbaus, Laufbahn, Privatbriefbogen, Scharfblick, Schiffbrüchen, Schlafbedürfnis, steifbeinigen, Stiebfbruder (4), strafbar (2), tiefbelustigt, tieflauen (2), unangreifbar
