The luatexbase-compat package

Heiko Oberdiek (primary author of luatex) Élie Roux (primary author of luatextra) Manuel Pégourié-Gonnard (current developper)*

https://github.com/mpg/luatexbase lualatex-dev@tug.org

2011/05/24 v0.4

Abstract

The LuaTEX manual is very clear: everything may change. This package provides tools to help package writers deal with the changes. It helps supporting LuaTEX versions down to 0.25.4, and is tested with LuaTEX 0.40.6 (TEX Live 2009), LuaTEX 0.60.2 (TEX Live 2010) and current beta versions.

The supported formats are Plain and LATEX adapted for LuaTEX as provided by TEX Live and MiKTEX (see lualatex-doc.pdf section 4 for details about these formats).

1 Documentation

Three problems are currently addressed by this package: changes in the syntax of \directlua, version information, and variable policies for primitives activation and naming (in LuaTeX itself as well as in the formats provided by distributions).

Older versions of LuaT_EX used to support multiple Lua states. A number was mandatory with \directlua in order to specify the Lua state to be used. Later, support for multiple Lua states was removed and the old syntax resulted in a warning. Now (LuaT_EX 0.50), \directlua again accepts a number after \directlua, but with a different meaning (see the LuaT_EX manual for details).

^{*}See "History" in luatexbase.pdf for details.

This package provides a macro \luatexbase@directlua that expands to \directlua0 on LuaTeX 0.35 and lower (where the number is mandatory), and to \directlua otherwise. It is a macro in both cases so that it always expands in exactly two steps.

Current versions of LuaTeX make the version available directly from Lua as tex.luatexversion and tex.luatexrevision. However, older versions (such as 0.25.4) didn't, which makes it particularly uneasy to test the version from within Lua. The present package makes this information available as luatexbase.luatexversion and luatexbase.luatexrevision.

Starting with LuaT_EX 0.39.0, the only primitives available in IniT_EX mode are the basic primitives from T_EX82 and \directlua. All other primitives are hidden by default and have to be activated using a Lua function. In T_EX Live 2009 (LuaT_EX 0.40.6), the following arrangement has been made in order to try preserving usability while avoiding name clashes in the L^AT_EX world: in L^AT_EX-based formats, all pdfT_EX primitives are enabled with their normal name, but the primitives specific to LuaT_EX are enabled with the luatex prefix. In Plain based formats however, all the primitives are enabled with their natural name, but are also provided with the same name as in L^AT_EX-based formats in order to help writing generic packages.

So, starting with TeX Live 2009, the situation is clear: the prefixed version of the LuaTeX primitives is always available. But in earlier versions (TeX Live 2008, LuaTeX 0.25.4) those primitives were available only with their natural names. The primitives provided by ε -TeX and pdfTeX on the other hand, are always available.

$\label{luatexbaseQensureQprimitive} $$ \langle name \rangle $$$

The tool provided to deal with that is \luatexbase@ensure@primitive, whose argument is a LuaTeX primitive name (without a leading backslash nor any luatex prefix, eg just {latelua}). It makes sure that the primitive gets available as \luatex(name).

Warning. In particular circumstances, this macro may fail silently for primitives whose natural name starts with luatex, hence such primitives shouldn't be used as arguments. This is actually not a problem, since the only three such primitives are \luatexversion, \luatexrevision and \luatexdatestamp. The first two are already activated by ifluatex which is loaded by this package, so you don't need to activated them yourself. The third should never be used in production according to the LuaTeX manual.

Remark. If you only aim at compatibility down to TEX Live 2009 (LuaTEX 0.40.6), then you can simply use the primitives with their prefixed name (except for \directlua which never needs a prefix). If you want extra security and/or compatibility down to TEX Live 2008 (LuaTEX 0.25.4) then you should use \luatebase@ensure@primitive for each primitive you intend to use (except \directlua again).

This package doesn't try to activate every primitive, since it would require an extensive list of primitives for each version of LuaTeX, so it seems simpler to leave that burden on package writers.

2 Implementation

1 (*texpackage)

2.1 Preliminaries

Catcode defenses and reload protection.

¹The prefix is dropped for primitives whose name already starts with luatex.

64
      Package loading has been stopped to prevent additional errors.}
65
66
   \expandafter\luatexbase@compat@sty@endinput%
67\fi
```

2.2 \directlua abstraction

Define \luatexbase@directlua to be either \directlua0 or \directlua, depending on the version of LuaT_FX.

```
68 \begingroup
69 \expandafter\ifx\csname newcommand\endcsname\relax
70 \toks0{\long\def\luatexbase@directlua}%
71 \else
72 \toks0{\newcommand\luatexbase@directlua}%
73 \fi
74 \ifnum\luatexversion<36
75 \toks0\expandafter{\the\toks0{\directlua}}%
76 \else
77 \toks0\expandafter{\the\toks0{\directlua}}%
78 \fi
79 \expandafter\endgroup
80 \the\toks0
```

2.3 Version information

Make \luatexversion and \luatexrevision available from Lua.

```
81 \luatexbase@directlua{%
82  luatexbase = luatexbase or {}
83  luatexbase.luatexversion = \number\luatexversion\space
84  luatexbase.luatexrevision = \number\luatexrevision\space}
```

2.4 Primitives

Try reasonably hard to activate a primitive. First, check if it is already activated an do nothing in this case.

```
85 \begingroup
86 \expandafter\ifx\csname newcommand\endcsname\relax
87 \toks0{\def\luatexbase@ensure@primitive#1}
88 \else
```

```
\toks0{\newcommand*\luatexbase@ensure@primitive[1]}
90 \fi
91 \toks2{}\def\x#1{\toks2\expandafter{\the\toks2 #1}}
92 \x{%
     \ifcsname luatex#1\endcsname \else}
93
94 \ifnum\luatexversion<37\relax
    tex.enableprimitives() not available. If the unprefixed primitive is undefined, issue an
error.
95
     \x{%
       \begingroup\expandafter\expandafter\expandafter\endgroup
96
97
       \expandafter\ifx\csname #1\endcsname\relax}
     \begingroup\expandafter\expandafter\expandafter\endgroup
98
99
     \expandafter\ifx\csname PackageError\endcsname\relax
100
         \errmessage{%
101
           Package luatexbase-compat error: failed to enable '#1'.}}
102
     \else
103
104
         \PackageError{luatexbase-compat}{%
105
           Package luatexbase-compat error: failed to enable '#1'.}{}}
106
     \fi
107
     \x{%
108
       \else}
109
    Use the unprefixed primitive to define the prefixed version.
110
         \expandafter\let\csname luatex#1\expandafter\endcsname
111
         \csname#1\endcsname
112
       \fi}
113
114 \else
    tex.enableprimitives() available, use it.
115
       \luatexbase@directlua{tex.enableprimitives('luatex', {'#1'})}}
116
117 \fi
118 \x{%
120 \toks0\expandafter{\the\toks0\expandafter{\the\toks2}}
