

NAME

latex, elatex, lambda, pdflatex – structured text formatting and typesetting

SYNOPSIS

latex [*first-line*]

DESCRIPTION

This manual page is not meant to be exhaustive. The complete documentation for this version of \TeX can be found in the info file or manual *Web2C: A TeX implementation*.

The \LaTeX language is described in the book \LaTeX – *A Document Preparation System*. \LaTeX is a \TeX macro package, not a modification to the \TeX source program, so all the capabilities described in **tex**(1) are present.

The \LaTeX macros encourage writers to think about the content of their documents, rather than the form. The ideal, very difficult to realize, is to have no formatting commands (like “switch to italic” or “skip 2 picas”) in the document at all; instead, everything is done by specific markup instructions: “emphasize”, “start a section”.

The primary source of documentation for \LaTeX is the \LaTeX manual referenced below, and the local guide in the file *local-guide.tex* or *local.tex* or some such.

elatex is the e- \TeX extended mode version of \LaTeX format.

lambda is the Omega version of the \LaTeX format.

pdflatex is the pdf \TeX version of the \LaTeX format.

On some systems **latex209** and **slitex** are available for compatibility with older versions of \LaTeX . These should not be used for new texts.
