LATEXDIFF-VC(1) LATEXDIFF-VC(1)

NAME

latexdiff-vc - wrapper script that calls latexdiff for different versions of a file under version management (CVS, RCS or SVN)

SYNOPSIS

```
latexdiff-vc [ latexdiff-options ] [ latexdiff-vc-options ] -r [rev1] [-r rev2] file1.tex [ file2.tex ...]
```

latexdiff-vc [latexdiff-options] [latexdiff-vc-options] [--postscript | --pdf] old.tex new.tex

DESCRIPTION

latexdiff-vc is a wrapper script that applies *latexdiff* to a file, or multiple files under version control (CVS, RCS or SVN), and optionally runs the sequence of latex and dvips or pdflatex commands necessary to produce pdf or postscript output of the difference tex file(s). It can also be applied to a pair of files to automatise the generation of difference file in postscript or pdf format.

OPTIONS

```
--rcs, --svn, --cvs, or --git
```

Set the version system. If no version system is specified, latexdiff-vc will venture a guess.

latexdiff-cvs and latexdiff-rcs are variants of latexdiff-vc which default to the respective versioning system. However, this default can still be overridden using the options above.

```
-r, -r rev or --revision, --revision=rev
```

Choose revision (under RCS, CVS, SVN or GIT). One or two $-\mathbf{r}$ options can be specified, and they result in different behaviour:

```
latexdiff-vc –r file.tex ...
```

compares *file.tex* with the most recent version checked into RCS.

```
latexdiff-vc –r rev1 file.tex ...
```

compares *file.tex* with revision rev1.

```
latexdiff-vc –r rev1 –r rev2 file.tex ...
```

compares revisions rev1 and rev2 of file.tex.

Multiple files can be specified for all of the above options. All files must have the extension . tex, though.

```
latexdiff-vc old.tex new.tex
```

compares two files.

The name of the difference file is generated automatically and reported to stdout.

-d or **--dir -d** *path* or **--dir**=*path*

Rather than appending the string diff and optionally the version numbers given to the output-file, this will prepend a directory name diff to the original filename, creating the directory and subdirectories should they not exist already. This is particularly useful in order to clone a complete directory hierarchy. Optionally, a pathname *path* can be specified, which is prepended instead of diff.

--fast or --so

Use latexdiff-fast or latexdiff-so, respectively (instead of latexdiff).

perl v5.14.2 2013-06-10 1

LATEXDIFF-VC(1) LATEXDIFF-VC(1)

--ps or --postscript

Generate postscript output from difference file. This will run the sequence latex; latex; dvips on the difference file (do not use this option in the rare cases, where three latex commands are required if you care about correct referencing). If the difference file contains a \bibliography tag, run the sequence latex; bibtex; latex; latex; dvips.

--pdf

Generate pdf output from difference file using pdflatex. This will run the sequence pdflatex; pdflatex on the difference file, or pdflatex; bibtex; pdflatex; pdflatex for files requiring bibtex.

--force

Overwrite existing diff files without asking for confirmation. Default behaviour is to ask for confirmation before overwriting an existing difference file.

--help or -h

Show help text

--version

Show version number

All other options are passed on to latexdiff.

SEE ALSO

latexdiff

PORTABILITY

latexdiff-vc uses external commands and is therefore limited to Unix-like systems. It also requires the RCS version control system and latex to be installed on the system. Modules from Perl 5.8 or higher are required.

BUG REPORTING

```
Please submit bug reports through
```
