NAME

latex, pdflatex, xelatex, lualatex, dvilualatex, cslatex, pdfcslatex, platex, uplatex, lamed – structured text formatting and typesetting

SYNOPSIS

latex [first-line]

DESCRIPTION

This manual page is a mere skeleton.

The $L^{A}T_{E}X$ language is described in the book $L^{A}T_{E}X - A$ Document Preparation System. $L^{A}T_{E}X$ is a $T_{E}X$ macro package, not a modification to the $T_{E}X$ source program, so all the capabilities described in **tex**(1) are present.

The LAT_EX macros encourage writers to think about the content of their documents, rather than the form. The ideal, very difficult to realize, is to have no formatting commands (like "switch to italic" or "skip 2 picas") in the document at all; instead, everything is done by specific markup instructions: "emphasize", "start a section".

The primary source of documentation for LATEX is the LATEX manual referenced below.

lualatex, **pdflatex**, **pdfcslatex**, **xelatex** are LAT_EX formats based on the respective engines. All output PDF by default.

lamed is the Aleph-based LAT_EX format (DVI output).

dvilualatex is LuaTeX-based and outputs DVI.

cslatex is csTeX-based (primitives integrated into pdfTeX) and outputs DVI.

On some systems **latex209** and **slitex** may still be available for compatibility with older versions of LAT_FX. These should not be used for new texts.
