NAME

mktextfm – create a TFM file for a font

SYNOPSIS

mktextfm [*options*] *font*

DESCRIPTION

This manual page is not meant to be exhaustive. The complete documentation for this version of TEX can be found in the info file or manual *Kpathsea: A library for path searching*.

mktextfm is used to generate a *tfm* file from the METAFONT source files for *font*, if possible. If *destdir* is given, the generated file will be installed there, otherwise a (rather complicated) heuristic is used.

The name of the generated file is printed on standard output.

mktextfm is typically called by other programs, rather than from the command line.

OPTIONS

mktextfm accepts the following options:

--destdir *dir*

A directory name. If the directory is absolute, it is used as-is. Otherwise, it is appended to the root destination directory set in the script.

--help   Print help message and exit.

--version

Print version information and exit.
