## **NAME**

dvitype, odvitype – translate a dvi file for humans

#### **SYNOPSIS**

DVITYPE(1)

**dvitype** *dvi* name[.**dvi**]

#### DESCRIPTION

This manual page is not meant to be exhaustive. The complete documentation for this version of T<sub>F</sub>X can be found in the info file or manual *Web2C*: A TeX implementation.

The **dvitype** program translates a DVI (DeVice Independent) file output by (for example) **tex**(1) or **gftodvi**(1), to a file that humans can read. It also serves as a DVI file-validating program (i.e., if **dvitype** can read it, it's correct) and as an example of a DVI-reading program for future device drivers.

The output file can include all commands, just the important ones, or none at all (in which case only errors are reported). A subinterval of pages may be selected for transliteration; the magnification and resolution of the "output device" may be changed; and so on. All options are specified with an on-line dialog.

The .dvi extension is supplied if omitted from dvi\_name. The output goes to stdout.

#### **OPTIONS**

 $-\mathbf{dpi} = REAL$ 

Set resolution to *REAL* pixels per inch; default 300.0.

-magnification=*NUMBER* 

Override existing magnification with NUMBER.

-max-pages=*NUMBER* 

Process *NUMBER* pages; default one million.

-output-level=*NUMBER* 

Verbosity level, from 0 to 4; default 4.

-page-start=*PAGE-SPEC* 

Start at PAGE-SPEC, for example '2' or '5.\*.-2'.

-show-opcodes

Show numeric opcodes (in decimal).

### **ENVIRONMENT**

The environment variable TEXFONTS is used to search for the TFM files used in the DVI file. See **tex**(1) for the details of the searching. If TEXFONTS is not set, it uses the system default.

## **AUTHORS**

Donald E. Knuth wrote the program. It was published as part of the  $T_EX$  ware technical report, available from the  $T_EX$  Users Group. Howard Trickey and Pavel Curtis originally ported it to Unix.
